There is no inn at this end of the lake, but the Penybont Hotel at the other extremity is reached in a few minutes. And, though off our route, it is well to diverge so far, for the road along Tallyllyn faces some of the grandest scenery in Wales. For those, however, who are satisfied with a halt at this end, I may mention that a cup of tea and an egg may be got at a cottage by the roadside at Minfordd. Possibly, though, you may have to search for the good woman among her fowls or waken the echoes of Cader with your lungs—as we did. But we got our tea.

From the very door of this cottage the road starts on its climb up the From Pass—seen in the background of our illustration. It is two miles long, and begins with a gradient of one in twelve. But it soon becomes easier and is not very steep. Above tower the mountains. On the one hand Cader heaves up his great buttresses, on the other tremendous slopes with dark crags impend. From time to time these—or the loose screes of the "wash-outs," find their way across the road in the

* Motor Car Journal, September 8th and 16th, 1906, "Under the Brecon Beacons and Through Mid-Wales."

form of an avalanche, and we shall notice many a bit of new masonry where a breach has been made in the wall separating us from the gorge below. Down this the little stream that feeds Talyllyn rushes merrily: high above the white thread of a waterfall gleams against Cader's flank.

Passing a tarn we reach the summit, 938 feet above the sea, and immediately commence the fine run (barring a little roughness at first) of over five miles down to Dolgelley. On the way we came upon the lonely and oddly-named inn of the Cross Foxes. But why the *cross foxes*? Now, one of the ascents of Cader is up a scree called the Foxes' Path, a path which no fox in his senses would take. It has been suggested that this inn was the meeting place of two very irate Reynards cross with the toils of the ascent! I have been up the Foxes' Path myself and can understand their feelings.

The beautifully-wooded country reached after passing the Cross Foxes is a welcome change from the barrenness of the last few miles. But the descent becomes steeper as Dolgelley is approached, and, though by no means dangerous, requires care,

times, rather bumpy stretches to a moorland district high and exposed to every wind that blows. At the end of this comes Trawsfynydd, a large, cold-looking village 800 feet above the sea. And henceforward we, for awhile, drive warily. There is a steep and dangerous corner leaving the village, the first of a series of short, sharp hills that for the next mile or two turn the road into a veritable switchback. Then we reach the hamlet of Maentwrog Ucha, at the top of the long, twisting descent to the Vale of Festiniog. This is one of the worst hills in Wales and should be taken with great care. It drops 400 feet in a mile and a half and in places must have a gradient of one in eight or less.

At the bottom lies the village of Maentwrog, beautifully situated in the green, wooded strath through which the waters of the Dwyryd wind to the sea, now close at hand. High on a hill top in the background appears the little town of Festiniog, and further away the town of Blaenau Festiniog—they seem hard up for names hereabouts—with its extensive slate quarries, dark precipices and noble group of mountains. Maentwrog means stone of Twrog, whoever he may have been. But there,

The river Glaslyn.

for there are one or two sharp curves. The town itself is a clean little place on the Wnion, a mountain stream coming down the valley from Aran Mawdd, a hill loftier even than Cader Idris, though not so fine to look at.

There are two routes from Dolgelley northwards. The first and longer is by way of Barmouth and Harlech; the other through Trawsfynydd. We have been over both, and must admit that the Barmouth route is the better. However, as it has been described elsewhere, we will give the one last named. It begins well enough, the road, a decent one, running up the valley of the Mawddach, past the pretty village of Llanelltyd, and the ruins of Cymmer Abbey, which lie on the eastern bank of the river. Tyn-y-Groes Inn, set in a wooded nook of the mountain, comes next, a pleasant place to halt for lunch. For from its doors we can look up the valley very nearly to the gold mines started by Mr. Pritchard Morgan some years ago, and which at the time caused quite a sensation, though little has been heard of them since. Soon after leaving Tyn-y-Groes the road leaves the Mawddach and ascends by long and, at

beside the church, stands the stone right enough, a Celtic menhir of hoar antiquity with 'T W R O G' graven more or less plainly thereon.

Crossing the river we enter Carnarvonshire, and passing beneath the charming hillaide domain of Tan-y-Bwlch, run down the estuary over a good road to the dull little seaport of Penrhyn Deuddraeth. There is a steep ascent through the town, and we have hardly surmounted it when we have to pull up for a moment at a level crossing. For a train is due down the little mountain railway that brings slates (and passengers) from Blaenau to Penrhyn. It rumbles past, and we note the queer-looking but very powerful locomotive, which is for all the world like two engines run into one with a funnel at each end. It vanishes round the curve; the gates swing open, and we descend to the Traeth, e.g. Strand, a great green plain once under the sea, but now reclaimed and an expanse of pasture land. On a dead level the road skirts the Traeth and then again takes to winding round crags and through woodland, with the sharp peak of Cnicht towering above on the right and Moel Hebog away

across the valley. And here a word of warning which applies not only to this road but to all other mountain roads in Wales. "Keep your eye lifting," as sailors say, for cattle. Never take it for granted that there is nothing irresponsible round the corner. I, who write unto you, know. I nearly ran into a heifer here myself, and, only the other day, a car travelling further "up along" came suddenly upon a flock of sheep—and several became untimely mutton. Wherefore, where fences do not exist, go cannily round corners.

Suddenly we come, not upon a sheep, but upon Pont Aberglaslyn, the grey arch spanning the torrent that comes down at the foot of tremendous cliffs from the valley beneath Snowdon. This pass of Aberglaslyn is, I suppose, the finest bit of scenery of its kind in Wales, and you can see it all from the road, and best of all from the bridge. A short ascent round the wooded spurs of Moel Hebog and lo! there comes into view the green amphitheatre where, girt about by mountains, is the village of Beddgelert. As we approach it we notice beneath a tree in the meadow to our right one or two upright stones. These mark, or are supposed to mark, the grave of Gelert, the hound of Prince Llewelyn, slain by his master in a fit of rage. For Llewelyn, returning from the chase, found the baby's cradle overturned, the baby missing and Gelert covered with blood. Jumping to conclusions, he slew poor Gelert with his javelin, only to discover a few minutes later the baby sound asleep behind the cradle and a wolf, sound asleep, too, behind the baby. But the wolf's sleep was the sleep of death. Gelert had killed it and saved the child. The name of the village perpetuates the poor beast's memory. For Beddgelert means Gelert's Grave.

Beddgelert is quite a tourist centre. There are two good hotels, and quite a number of boarding houses. It is a pleasant place withal, and one is tempted to linger—as a matter of fact I have lingered here more than once or twice. But we ought, I suppose, to get on to Carnarvon, for as yet we have come no great distance, and Carnarvon is a livelier place for the night than Beddgelert, if less romantic. The road starts up an interminable hill, and we have something like three miles of climbing before emerging upon the moorlands at the very foot of Snowdon, whose great hollows and precipices are a fine sight further on. On the left, by the very roadside, is the rock called (and duly labelled) Pitt's Head, in profile a grotesque likeness of the eminent statesman. Hereabouts starts the "Beddgelert route" up Snowdon—after that from Llanberis the easiest. But it is not meant for motor-cars, and no pneumatic or any other tyres will ever cross Bwlch-y-maen, though, as all the world knows, they have climbed the mountain from Llanberis. But then Du Cros and Letts had a railway track to go upon, and I am sure that they would not have negotiated Snowdon by the path. Even as it was the latter gentleman went perilously near the edge of a precipice.

The road drops through the village of Pont Rhyd-ddu to Llyn Cuellyn, following the margin of the lake its entire length. This is a sweet spot—rendered all the more sweet, perhaps, to the average mortal, by the presence of a hotel. This is a great place for anglers, who, if guests thereat, may fish in the lake free of charge. Here another route starts up Snowdon (the hotel, by the way, is called the Snowdon Ranger) and there is mountaineering galore. Climbers who are satisfied with minor peaks may try the Elephant mountain or Mynydd Mawr, which rears its great bulk over the lower end of the lake. Between it and Snowdon the road enters the pass of Nant Garmon and winds down a romantic valley to the hamlet of Bettws Garmon, beloved of artists. A little beyond it we leave the pass—the easiest in Wales—and, getting into a country more open, descend swiftly to Carnarvon.

(To be concluded.)

At the Old Street (London) Police Court, on Tuesday, a man said his occupation—that of a horsekeeper—had gone owing to the introduction of motor-cars. The magistrate (Mr. Cluer) replied that the motor vehicles and electric trams had given employment to a greater number of men than their coming had displaced, though it was no doubt true individuals suffered.

A NOVEL PETROL MOTOR.

A SOMEWHAT novel form of single-cylinder petrol motor, in which an impulse is given to the crank shaft at each revolution, has lately been devised by M. Boudreaux, of Paris. In the ordinary single-cylinder engine there is, of course, only one explosion per two revolutions, this resulting in a very uneven torque and necessitating the use of a relatively large flywheel. It was to overcome these drawbacks that the motor, illustrated in section herewith, has been introduced. It will be seen that the cylinder is not only longer than usual, but has two diameters, A being the normal and B the larger one. The piston is also of a special shape, one end P being of a diameter to fit within the portion A, and the other P' corresponds to the enlarged part of the cylinder. Both A and B are provided with valve pockets, in which are located separate sparking plugs and valves, the exhaust valves, not seen in the drawing, being apparently located at the side of the inlets. The engine acts on the ordinary Otto cycle of suction, compression, impulse, and exhaust strokes, the timing of the valves being so arranged that

when the small piston P is on the compression stroke, the larger one P' is on exhaust. One of these novel motors has been fitted to a boat, and is stated by M. Baudry de Saunier, in "Omnia," to be giving very satisfactory results.

CONTINENTAL tyre manufacturers are not only vying with each other in the production of motor tyres, but are apparently sparing no efforts to produce guide books of a most complete kind for the use of touring motorists. From the Continental Tyre Company we have received a copy of the 1907 edition of the Guide Routier Continental, which deals with France, Algeria and Tunis. The book is assuming bulky dimensions, the latest having incorporated within it twenty-eight itineraries in the three countries named. Not only so, but two detailed maps of Paris and suburbs have been added to facilitate the selection of the best way out of the French capital to the desired point. The list of hotels recommended has been revised; in fact, nothing has been spared to make the work indispensable to motorists, who may be well recommended to procure a copy of the same, especially in view of the fact that only a small charge is made to cover the cost of postage.

CONTINENTAL NOTES.

The Brescia Race Meeting.

Arrangements are well in hand for the Brescia race meeting on Sunday and Monday next, September 1st and 2nd. The first day's race—the Florio Cup—is open to cars having engines of a maximum cylinder capacity of eight litres and a minimum car weight of 1,175 kilograms. The event will be held on a 60.79 kilometre course, which, starting and finishing at Brescia, takes in Castiglione and Lonato. Eight laps are to be run, giving a total distance of 485.9 kilometres (303½ miles). Thirty-nine entries have been received, these comprising three each Spa, Itala, Isotta-Fraschini, Bianchi, De Luca and Daimler, Rapid, Benz, Brixia-Zust, Sueddeutsche Fabrik, Wolsit, Junior, two Rochet-Schneider, two Darracq, an Eisenach and an Aries. The race on September 2nd is known as the Coppa della Velocita. This is open for all types of petrol cars, irrespective of weight or power, and will be

operations between Lille, Roubaix and Tourcoing being already in an advanced condition.

A Hospital for Motorists.

The foundation-stone of a new annexe to the hospital at Lisieux, France, was laid on Friday last week in the presence of the relatives of the late Mr. Stillman, of New York, who was injured in a motor-car accident a year ago, and who died some weeks afterwards in the hospital. The annexe is to be erected to his memory, and is to be specially used for persons who have been injured in motor-car accidents.

The Pekin-Paris Run.

M. Godard on the Spyker car and Messrs. Cormier and Collignon on the De Dions arrived in Berlin on Friday last week,

The Brescia Race Meeting.—A view on the Course near Castenedolo.

run on a petrol allowance basis, viz., 30 litres per 100 kilograms. The distance is the same as for the Florio Cup, and seventeen cars are expected to face the starter—three each Bayard-Clement, Brasier, Itala, Spa, and Lorraine-Dietrich, a Darracq, and a Diatto-Clement.

The 1908 A.C.F. Grand Prix Race.

The rumour that the 1908 A.C.F. Grand Prix race would again be held on the Dieppe circuit is apparently without foundation, as the Sporting Commission of the A.C.F. is seeking information as to suitable circuits in other parts of France of a length not exceeding 100 kilometres. The event is to be held between June 20th and July 5th.

A Road for Motorists.

King Leopold's plan for attracting motorists to Ostend by means of a magnificent motoring boulevard between Lille and that town is now being put into execution. Both on the French and Belgian territory the work is being actively pushed forward,

and are expected to reach Paris on Friday, the 30th inst. The Spyker will then return to Amsterdam by road, after which it will be sent to London for exhibition purposes.

Miscellaneous Items.

Workmen are now engaged on the erection of a monument at the entrance to the Bois de Boulogne, Paris, in memory of the late M. E. Levassor, one of the pioneers of the motor movement in France.—The German Motor Volunteer Corps is to play an active part in the forthcoming military manoeuvres in Germany, forty-two cars having already been promised.—Herr H. Bussing, of Brunswick, Germany, is building three 24-30-h.p. single-deck 'buses for service in Vienna.—An automobile club is being formed at Ostend.—Thirty-six entries have so far been received for the voiturette and light car trials which are to be held in France in October next.—An interesting report has just been issued in connection with the traffic problem in Paris, in which it is recommended that the present horse-drawn 'buses shall be superseded by motor-'buses.

AT Bingley, on the main road from London to Glasgow, Messrs. Ferrand and Sutcliffe have a garage. It is located in Main Street.

By providing a motor-car for the use of the water engineer the Dundee people hope to save £50 per annum. Arrangements are being made for the sale of the horses and vehicles now in the possession of the Dundee Water Committee.

THE Bishop of Ely has recently acquired an 18-h.p. Siddeley car; it is fitted with a single landaulet body built by Messrs. W. and F. Thorn, of Great Portland Street, London, W.

A 20-30-h.p. Delaunay-Belleville chassis has just been acquired by Mr. C. D. Rose, M.P., the chairman of the Royal Automobile Club. It has been fitted with a side-entrance doublephaeton body and hood.

IN Queen Street, Newton Abbot, Messrs. Balls Bros. have a commodious garage and facilities for the repair of motor vehicles.

THE Fiat Company have recently supplied cars to the Duke of Rutland, Lord Villiers, Lord Binning, Lord Monson and Sir George Abercrombie.

THE appeal by Mr. D. M. Weigel against the sentence of a month's imprisonment for driving his motor-car at a speed of fifty-six miles an hour at Handcross will be heard at the East Sussex Quarter Sessions, at Lewes, on October 15th.

A SCHOONER stranded on Gunfleet sand early on Monday morning. The Walton-on-Naze motor lifeboat, James Stevens, helped to pull the vessel off the sand at high water. This is the third service rendered by this motor-lifeboat in a month.

A MOTOR gymkhana was held in Heathfield Park (Sussex) the other day, when among the prize winners were Dr. Lovell-Keays, Mr. W. C. Alexander, and Dr. W. J. Webster. A similar gathering has taken place at Middleton (Norfolk), where thirteen cars took part in the competitions.

A DAIMLER car will shortly be on exhibition in the garage of the Automobile Club of Spain, at Biarritz, and the Daimler Company have entered into an arrangement with the manager, whereby motorists passing through Biarritz can purchase small parts for Daimler cars at the club's garage.

ALTHOUGH primarily intended for those who take their pleasures on foot, the new edition of "Across the Derbyshire Moors," by Mr. John Derry, which has just been issued from the "Sheffield Daily Independent" offices, will be of interest and of value to motorists who seek the pleasures of travel in the hilly district of the Peak. The twelve rambles here described, and each illustrated by a sketch map which shows the roads and their junctions with admirable clearness, will indicate to our readers how they can best see the pleasant district around Sheffield, including Hathersage, Grindleford, Edale, Kinderscout, and other famous resorts.

HERE AND THERE.

Touring in France.—A Motor Car at the Old City Gate of Carcassonne.

A NEW wind screen known as the Invincible is being introduced by the Nottingham Motor Company, of Bradford Chambers, Nottingham.

RUGELEY is becoming a favourite place with Midland motorists. It is the centre of an interesting district, Ingestre Hall, the seat of the Earl of Shrewsbury, and many another lordly mansion, being within easy reach.

MR. OLIVER STANTON, the well-known motor expert, has just acquired a 40-h.p. Weigel chassis, which is now being fitted with a limousine body by Messrs. Sayers and Co.

MR. B. J. F. BENTLEY and Mr. Wells, who left Djibuti at the beginning of the month on an 18-h.p. Siddeley in an attempt

to reach Khartum, via Adis Abeba, the capital of Abyssinia, reached Zeila on Friday, last week. The journey has been one of immense difficulty owing both to the sand of the desert and to the mountainous district traversed.

THE secretary to the Devon and Somerset Stag-hounds has issued an appeal to members of the Hunt not to allow their motor-cars to be moved about the roads while a hunt is in progress. When the hunted stags have entered the beautiful valley of the Exe to try and shake off their pursuers by a turn in the water, the field have more than once found their movements impeded by motor-cars.

THE "Auto," of Paris, ever on the search for novel competitions, is about to organise one to test the knowledge of motor-car drivers in case of breakdowns on the road. A number of cars are to be purposely placed *en panne* from the same derangement; the competitors, who will be unaware of the cause of the stoppage, will then be allotted one vehicle, and the one who gets his machine going first will be adjudged the winner.

IN a few days a new motor school will be opened at 10 and 12, Heddons Street, Regent Street, London, W., by Motor Schools, Ltd., of which Mr. Turberville Smith is managing director, with Mr. Llewelyn Morgan as general manager. A permanent staff of instructors has been appointed, and arrange-

ments will be made for instruction in motor boating at Richmond, as well as motor-car driving at the school.

NORTH SILVER STREET, Aberdeen, has a garage owned by Mr. J. Jackson, and capable of accommodating about a score of motor-cars.

AT the annual sports at Pitlochry—made familiar to motorists in the Scottish trial—a motor gymkhana has been held, with the following results:—Serpentine Driving Competition: 1, Dr. Anderson, Pitlochry; 2, Capt. Wentworth, of Dal; 3, Alister Macdonald, Atholl Hydropathic. Lemon Cutting and Cleaving the Turk's Head: 1, Dr. Anderson; 2, Alister Macdonald; 3, Capt. Wentworth. Best Decorated Car: 1, A. Macdonald; 2, D. M. Stuart, Pitlochry.

MR. R. T. LANG has been joined by Mr. R. C. Warren in his business of advertisement adviser.

THE Motor Union of Western India is putting up the Motor Union signs near a school at Bombay.

A NEAT device for electrically igniting acetylene headlights has recently been placed on the market by the No-Match Electric Manufacturing Company, 141, Milk Street, Boston, U.S.A. The arrangement is somewhat similar to an electric gas lighter, and is shown in the accompanying illustrations. A four terminal trembler coil is placed under the front or rear seat or on the dashboard, and the push button for making the contact can be located at any convenient point near the driver's seat. The primary side of the coil is connected with the push button

Fig. 1.—Diagram of Wiring. Fig. 2.—The No-Match Electro-Burner.

and both terminals of the ordinary ignition accumulator. Each burner is then connected with one terminal of the secondary circuit of the coil, care being taken that no contact is made with any metal part of the burner except at the place where the wire is fastened. The wires can be run up through the small air circulation holes which are found in the base of all lamps. A good grade of insulated wire should be used, and this can be run along the under side of the frame or in any other way covered from view, care being taken, of course, to keep clear of the exhaust pipe or other heated parts. When properly installed in this way with any standard coil it is claimed that both burners will light simultaneously without fail the instant contact is made by the push button; and where the generator is placed on the running board, or gas tanks are used, the lamps can be lighted by a touch of the button while the car is in motion.

MR. J. B. SANDBACH is responsible for a new volume just published by Messrs. J. E. Cornish, Ltd., of Manchester, on the "Law of Motor Cars." In compiling this the author has had the advantage of the suggestive advice of Mr. T. W. Grace, of Manchester, and has also been guided by the many cases decided under the Act—assistance not available to the authors of the earlier text-books.

MESSRS. TILLEY AND SON, motor-car agents, of Dorchester, have lately completed the erection of a large new garage on a plot of land in Victoria and Hardwicke Streets, Weymouth. The building is substantially constructed, and practically covers the whole site of 100 ft. by 88 ft. It is within 65 yards of the sea front road and rather over 200 yards from the railway station. There are three entrances to the garage, the floor space of which is capable of accommodating over forty cars. The repair shop is also included in the premises; this measures 40½ ft. by 37½ ft., one-half being on a 3 ft. lower level, reached by steps running the whole length of the building. From the top of these steps the cars are run on to trestle stages erected over the low-level portion of the floor, and thus they are brought into a convenient position for repairs. Adjacent to the repairing shop is a washing yard, where two or three cars can be treated simultaneously, water and hose-pipe being conveniently attached. At the extreme end of the garage are four private lock-up motor-houses; these are fitted with iron revolving shutters. The building, which has been constructed to the designs of Mr. Alfred J. Bennett, C.E., architect and surveyor, Weymouth, is lighted by electricity. Altogether, motorists will find the new garage one of the best equipped in Dorsetshire.

SIR WM. G. D. GOFF, Bart., has just acquired a 30-h.p. Beeston-Humber car.

THE Hon. Walter Guinness, the new M.P. for Bury St. Edmunds, is a motorist.

AFTER having heard repeated *ad nauseam* for many years that only the United States can turn out machine tools, it is refreshing to read that European machinery for motor-car manufacture is finding its way into America. For example, Mr. J. Joyce, the general manager of the American Locomotive Automobile Company, of Providence, R.I., is quoted as saying, "It is a mistake to think that we use machinery a great deal more than the foreigners do. One of the later inventions in tool work is a machine for grinding cylinders. This is peculiarly an American development. On the other hand, we have in our factory, at Providence, a gear hobbing machine, which cuts gears by a screw-like movement that is infinitesimally precise. This we imported, and there is nothing else like it in this country. We have also at Providence a remarkable milling machine for turning out camshafts, and this is of English design and build."

A RESONANT motor-alarm actuated by the exhaust is that known as the Gabriel horn—a simple appliance consisting of a single tube divided into three chambers, each of which produces a separate and distinct note. The exhaust gases are received into an expansion reservoir in the horn, and are equally distributed to the three chambers under a steady pressure. At all times the volume of sound is under the control of the operator, who, recognising that there are no complicated parts to get out of order, has no worry as to his alarm. Messrs. Brown Bros., Ltd., who are placing the horn before British motorists, advise that it should be located against the side of the car, with the open end forward, although it may be fitted in any desired position. It is manipulated by means of a pedal from the floor of the car—a wire cord operates a special valve, which opens the pipe of the horn, and at the same time closes the muffler exit, thereby directing the whole exhaust through the horn. Now that the horn has often ceased to enervise the lumbering carter, the Gabriel horn is offered as an effective variant likely to achieve the purpose of such a signal.

WE illustrate herewith a little device which will be found useful in connection with tyre troubles, and which has lately been introduced by M. C. Durand, of 178, Boulevard Pereire, Paris. One of the most frequent annoyances in fixing a tyre is the danger of nipping the inner tube, with, as a result, the bursting of the air chamber before the car has travelled any

great distance. When mounting the tyre one hand is usually engaged in holding up the security bolt, while the other pushes the beaded edge of the cover into position. By means of the new device, which is known as the Leve-Papillon Automatique "Biguet," the security bolt is automatically held up, leaving both hands free for working on the cover.

ON a motorist being fined at Southampton Police Court for exceeding the legal limit in that town, he informed the Bench that he should stop his subscription to the Southampton Hospital by way of compensation. The chairman, who is president of the hospital, expressed his regret, and also his intention of increasing his own subscription by £5, the amount threatened to be withdrawn by the motorist.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE MOTOR UNION CONTROVERSY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if you will kindly publish the enclosed correspondence, and also this letter. I have resigned my membership of both the Royal Automobile Club and the Motor Union, as a public protest against the antagonistic and underhand policy adopted by the Motor Union towards the Automobile Association.

In future I intend to transfer to the Automobile Association the subscription which I formerly paid to the other two institutions conjointly, and would express the hope that if other motorists take the first step, which I have taken, they will also follow me in the same procedure.—Yours truly,

A. J. MACDONALD.

(Vice-Chairman, Automobile Association)

The correspondence enclosed is as follows:—

14th August 1907.

Dear Orde,—Will you kindly let me know whether I can resign my membership of the Motor Union without at the same time adopting a similar course with reference to my membership of the Royal Automobile Club, which I should like to continue if possible under these circumstances.—Yours sincerely,

A. J. MACDONALD.

Royal Automobile Club, 119, Piccadilly, W.,
16th August, 1907.

Dear Macdonald,—I regret very much to inform you that under our existing agreement with the Motor Union there is no possibility of your resigning membership of that body, and I hope sincerely that you will not consider it necessary, in order not to have any association with it, to resign your membership of the Club.—Yours sincerely,

J. W. ORDE.

Dear Orde,—I thank you for your kind letter in answer to my enquiry of the 14th, which I received with regret.

As no other course is open to me than to resign my membership of the Royal Automobile Club, in order to enable me to sever my connection with the Motor Union, I must therefore take that step, and ask you to consider this letter as my formal withdrawal from the membership of the Royal Automobile Club.

Will you please express to your committee my sincere regret at finding myself compelled to withdraw from the Club, as, under the circumstances of the attitude adopted by the Motor Union towards the Automobile Association, it is impossible for me to do otherwise than absolutely to sever my connection with the Motor Union.—Yours sincerely,

A. J. MACDONALD.

To the Secretary
Motor Union.

Woolmer, Liphook,
August 19th, 1907.

Sir,—Be so good as to remove my name from the list of members of the Motor Union forthwith.

I have resigned my membership of the Royal Automobile Club to enable me to effect an absolute severance between myself and the Motor Union, in consequence of the attitude which that body have adopted towards the Automobile Association, of which I have the honour to be vice-chairman.—Yours truly,

A. J. MACDONALD.

THE 1908 A.C.F. GRAND PRIX RACE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. D. M. Weigel's letter re the 1908 Grand Prix Race, in which he asks for the views of several of the leading English makers upon the value of such races as a means of representing British productions to the world, it seems to me that every make of car I come across has done something, and won gold medals, cups, and what not. Also every maker is pushing the sale of his particular vehicle upon the strength and merit of what it has done in hill climbs, long distance, reliability, and non-stop runs. Now, can the views of manufacturers then really be solicited, when everyone knows that the more successfully a firm is represented in some big event, the more business that firm will do? If Mr. Weigel and others would state their opinions as to what are the qualifications, &c., of the drivers of these representative cars, upon whom rests so much, I am sure it would interest many besides myself. Will someone tell me how these men get their posts? Are their berths purchased, as I am informed? Of course I realise that firms will not place £1,500 worth (approximately) of machinery in the hands of anyone. And I recognise that born instinct, keen judgment, and resource form a large part of what is required personally. I possess these qualifications and my ambition is racing. I am by many influential men acknowledged a driver, and I am a master engineer. But to make my debut on the track with only £200 at the back of me is a puzzle

which some kindly-disposed person might elucidate through the columns of the *M.C.J.* Or will they advise me, as some have done, to give it up.—Yours truly,

H. J. CHAPMAN.

EXHAUST EXPANSION CHAMBER.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "M. D.'s" letter on the above subject in the last issue of the *M.C.J.*, a good expansion chamber can be constructed by having a plain cylindrical box, divided into several compartments by perforated plates, the perforations commencing large and decreasing in size toward the outlet. The size, of course, will depend entirely upon that of the engine, but the larger the expansion chamber in reason the better. Care should also be taken to have the metal of sufficient thickness to properly deaden the noise of the explosion—at least $\frac{1}{4}$ in. thick. This type of chamber should prove very effective, without any back pressure.—Yours truly,

H. J.

Kenilworth Castle, which is during the summer months visited by thousands of Americans, was dismantled by Cromwell during the Civil War, and has since been abandoned to decay. The above illustration depicts a Daimler car leaving the grounds of the Castle.

TON MILEAGE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Is there not something radically wrong with the method adopted by the Scottish and Irish Automobile Clubs in calculating petrol consumption per ton mileage?

When it comes to real economy in running an automobile, what has the chassis weight to do with petrol consumption? I have been looking carefully at the lately published results of the Scottish and Irish reliability trials, and, as a result of some rough calculations, have come to conclusion that a Milnes Daimler 'bus would certainly have won the Scottish and Goff cups had one competed.

It would seem from a common sense and practical point of view that the elimination rather than the accumulation of weight in the construction of an automobile should be rewarded.

Under present conditions I may have a car weighing 20 cwt. doing twenty miles per gallon, whilst the other fellow may have a similar car as regards carrying capacity weighing 25 cwt. and only doing eighteen miles to the gallon petrol consumption; but, although my car is running further on a gallon of petrol and is also necessarily more economical on tyres because of less weight, it is the other fellow who gets the reward for economy in petrol consumption.

Surely an automobile ought to be as light as possible provided it is sufficiently strong, and personally I fail to see what the weight of a chassis has to do with petrol economy. The point which our competition authorities ought to make clear is, which is the car which will run

the most miles carrying the biggest load with the least petrol consumption; the load, of course, being the actual number of persons, luggage or extras carried upon the car, quite apart from the weight of the necessary chassis and body.

I have no doubt there is a great deal to be said on this question, but the present moment appears to be an opportune one to endeavour to open a discussion, and it will be interesting to hear the views of others upon this question.—Yours truly,

PERCIVAL L. D. PERRY.

ANDOVER POLICE ACTIVITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the encouragement given by the magistrates to the police at Andover to prosecute, or shall I say persecute, motorists, it would be better for the town's welfare if the magistrates encouraged them to be as active at night-time in looking after the security of the town as they are in the daytime in setting traps.

When motoring from Cornwall I arrived at Andover at two o'clock in the morning, and there being no signpost, I was in doubt as to which was the London road. I stopped, and my friend stayed with the car while I walked through the principal streets for a quarter of an hour looking for a policeman or pedestrian to direct me. I presume that the police were all on duty during the daytime, and could not, therefore, be on both day and night work, for the fact remains that my engine (which was a single-cylinder engine) was making noise enough to awaken those who had a right to be in bed, and yet did not attract the attention of the guardians (*sic*) of the town. Eventually I had to leave by the road which I thought might lead me to London.—Yours truly,

J. L. VIVIAN MILLETT.

Mr. Hubert S. Thomas, of Llanelly, and his family on their four-year-old Argyl car. The vehicle was the winner of a non-stop certificate in the recent Welsh Reliability Run.

FINDING OWNERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If the County Councils take the interest in the proper regulation of motor traffic which they profess, they might materially help to attain their object by making it more easy to discover the names and addresses of the owners of cars corresponding to any given numbers.

I lately wanted to complain to the owner of the irresponsible manner in which his car was driven by his driver. I applied to the County Council where his car was registered, and was officially informed that I must send in my complaint for its reasonableness to be judged, and, that being allowed, must then pay 1s. for a copy of the register.

In short, there is a barrier of trouble, humiliation and expense to be overcome before we can have the privilege of helping the County Councils to control the "motor hog."

If the Motor Union can get this absurd regulation modified, its members will be encouraged to do much more than at present to expose inconsiderate and dangerous driving.—Yours truly,

D. W. SAMWAYS, M.D., D.Sc., &c.

THE MEDICAL EXAMINATION OF DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in the *M.C.J.* a letter from one of your correspondents on the subject of medical examination of motor drivers. So far back as November last, when my Motor Drivers' Employment Agency was started, I put it strongly in front of employers in the pro-

spectus issued, and, quoting the new Compensation Act, which came into force last July, I there said that it would be perhaps as well for employers of motor drivers to guard against the liability necessarily contingent on an Act of this sort, by insisting on medical examination of the driver chosen for employment, as it is well known to the medical profession that, unless sound in mind and body, a driver is a source of danger to the general public, and of grave responsibility to his employer.

Although we had made arrangements with a fully qualified practitioner, not one of the employers who have been supplied drivers by us have availed themselves of it; and neither can I gather, during the course of conversation, that they even think of it; and I must say that some of the drivers I have interviewed, wishing to place their names on the books, were suffering from what your correspondent aptly calls "really physical degeneracy and unfitness."—Yours truly,

CHARLES H. E. RUSH.

THE CONTROL OF THE ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The road agent scheme is yet another attempt at a bad copy of the excellent work of the Automobile Association by the Motor Union.

We have heard so much of the Union just lately that it is necessary to point out that this title is misleading. The Union is a place where hard work is done under proper supervision. It is not a place where other people's work is copied in a leisurely and inefficient manner. Again, their designation of road agents is wrong. "Relieving officers" is the correct term to use in conjunction with the Union.

It is needless to say more, but how long will it be before the relieving officer replaces the relieving officer of their new road scheme, and the staff of the Union enter the real union, where they will be taught to work independently and efficiently?—Yours truly,

A. A.

THE QUESTION OF TRANSMISSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is rather curious that different people draw such very different conclusions from the same event. I notice that Mr. S. F. Edge, in writing about the results of the Scottish Trials, draws from these results the conclusion that a modern motor-car must have a live axle. On the other hand, Mr. Charles Renold, in reviewing the results of the Scottish Trials, points out that during the trials of 1903, 1906, and 1907, transmission gear (presumably live axles) caused twenty-one complete breakdowns, while chains did not cause any.

I do not think that the most interested partisan of the live axle can bring forward anything against the chain except its nakedness, and from the date of the introduction by the Sunbeam Company of efficient protection for the chains, the chain case movement has steadily gone forward, and I venture to predict that at the coming Show there will be quite a number of firms, both British and Continental, who have copied this important development.—Yours truly,

FREDERIC EASTMEAD.

SPEED COMPETITIONS AND HILL-CLIMBING RULES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the letter in your issue of the 3rd inst. from Vauxhall Motors, Ltd., I do not think these gentlemen disagree with me. At any rate, I quite agree with their letter. They suggest that "if these hill-climbs are to be turned into racing, . . ." I believe they will agree that these hill-climbs are races, and are advertised as such, and that is their sole object. Being races, the object of my letter was to see if there could not be a method by which all clubs in this country could be forced to use one formula only. I believe that the Vauxhall Company will accept that such a proposition would be to the benefit of all concerned.

I have also suggested that trade cars be run as chassis. I believe that they, as well as other heads of motor-car firms, will agree that it would be a great saving in expense for motor-car manufacturers, and would have the same result in proving which was the better car, if these races ever do prove such a thing.—Yours truly,

D. M. WEIGEL.

SHOULD LADIES DRIVE MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A somewhat interesting discussion has lately arisen in your paper in regard to the question of cars being driven by ladies. Undoubtedly there are certain conditions prevailing which make it inadvisable for a woman to handle a car, particularly in traffic. A woman is more easily unnerved than a man by sudden complications which call for instantaneous action, and when it is necessary for her to take her hands from the steering wheel and push forward or backward a change-speed lever, she almost invariably does the wrong thing. What one really wants is a car which can be handled by constantly keeping the hands on the steering wheel, and where the change-speed and application of brakes is done entirely by the feet.

There are other reasons why this state of affairs is desirable. A

woman cannot be claimed to have a graceful appearance when endeavouring to push into position a change-speed lever which may be placed at any awkward angle on the side of the car, and certainly a woman's ambition should be to look as dignified as possible under all circumstances, and I cannot honestly say that most of my lady friends whom I see driving cars look at all graceful in the process. I must make one exception to this statement, however. I do not remember the name of the car, but I know that the whole of the changing of speed is carried out by means of pedals, and I should be very glad if some one of your readers who may be familiar with the car in question would recount his or her experience of the efficiency of this method of changing speed.—Yours truly,

MARGARET DEWELL.

MOTORING IN THE NEW FOREST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is quite likely that, in consequence of the fast and apparently reckless driving of some cars, new police methods may be instituted in the New Forest and the neighbourhood. There is much complaint, and unless drivers of their own accord mitigate their speed and behaviour something of the kind is to be feared.

This is not due to the local drivers but mostly to chauffeur-driven cars bearing the letters "A," "L.C.," and "L.N." The peculiar conditions which rule in the Forest and on its confines, the narrow, twisty

are just putting on the market, we have radically departed from the accepted form of pneumatic tyre in favour of a series of pneumatic studs staggered round the circumference of the wheel, and projecting from a flat base through a perforated steel rim. This does not in any case decrease its resiliency, and, from lengthy experiments at high speeds on very powerful and heavy cars, we find that we can guarantee a minimum life of 5,000 miles; that our tyre is an excellent non-skid, and that it cannot puncture or burst, whilst it has the great merit, from the point of view of other road users, of raising very little dust indeed. We fully agree with Mr. Cook that if the subject of wheels and tyres can be opened up much good should result, but we firmly believe that the desired results cannot be obtained except by entirely new methods of construction. In view of the demands upon the purse of the long-suffering motorist, the tyre question becomes of vital importance, and we therefore venture to invite your valuable co-operation in giving publicity to these facts.—Yours truly,

THE K.T. SYNDICATE, LTD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR—I was greatly interested in Mr. O. Cook's letter on the above subject, as I am most thoroughly in agreement with him as to the unsuitability of the pneumatic tyre for motor-cars. To me the idea of transmitting the power of an engine even as low as 10-h.p. through a piece of rubber and canvas is absurd, and I think that every-

The Pekin-Paris Run.—The arrival of M. Godard on the Spyker at Berlin.

roads, make fast driving a danger to users of the cars not less than to the other users of the roads. Apart from the dangers mentioned, there is the unpleasant fact that the motorists who are instrumental in bringing police tactics into play are in the district for only perhaps one day. They fit through at full speed and are seen no more, while less ambitious drivers are caught in the net which was not spread for them.

I am sure no one wishes the New Forest police to emulate their neighbours in Christchurch, so I hope all readers who may come to the district will drive as gentlemen and not raise opprobrium.—Yours truly,

A NEW FOREST MOTORIST.

WHEELS FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 10th inst. we notice a letter from Mr. O. Cook referring to the extract from Dr. Hele-Shaw's paper on "Road locomotion in relation to public health," in which letter your correspondent says "that the pneumatic tyre is no more suitable for a motor than slippers are to go pawning with, and therefore only possible for the wealthy." There is no doubt whatever that the present form of pneumatic tyre has the great merit of resiliency, but at the same time, owing to its shape and lack of grip upon the road, a certain amount of "skidding round" takes place at high speeds even in dry weather. This rapidly decreases the life of the tyre, and at the same time is responsible for a great deal of the dust nuisance. This is a defect inherent in all ring-shaped tyres, owing to their lack of grip. In the K.T. tyre we

one must in time come to the same opinion. To see the number of cars hung up on the roads any day with tyre troubles, and also to observe the quantity of costly spares carried on many cars, should make any thinking person come to the conclusion that the system is all wrong.

For myself I would rather give up motoring altogether than put up with the worry and expense of pneumatic tyres. I increased the diameter of my wheels and use solids, and I find this quite satisfactory for moderate speeds up to about thirty miles an hour, besides raising very little dust. There is no doubt that the tyre question is the greatest factor in preventing the motor-car becoming a really popular vehicle. Apart from tyres, the motor-car is the cheapest known form of locomotion, while, plus tyre cost, the most expensive, and, until the general public can be convinced that a car may be quite satisfactory without employing pneumatic tyres, the man of moderate means will rightly hesitate before becoming the owner of a motor.

I hope Mr. Cook will tell us what wheels his car is fitted with, as I feel sure this will interest a great many of your readers as well as—Yours truly,

J. BRYANT.

RUSHMORE LAMPS, LTD., ask to be permitted to point out that every Rushmore headlight and generator is indelibly marked with the name of the manufacturers, Rushmore Dynamo Works, Plainfield, N.J.

FROM the Automobile Association we have received a communication in reply to the statement of the Motor Union saying that they do not propose to make a full reply until the official views of the Motor Union representatives have been received.

CLUBS AND ASSOCIATIONS.

THE AUTOMOBILE ASSOCIATION.

ANOTHER important increase in the Automobile Association's sphere of usefulness is to be noted, and, in support of the patrol organization now being rapidly deployed in Lancashire, Yorkshire, Cheshire, Cumberland and Scotland, offices have been opened at 30, Cross Street, Manchester.

Every part of the A. A. work, including the appointment and control of patrols, erection of signs at dangerous spots, names of villages, &c., will be dealt with at the Manchester offices, and members' requirements in the shape of legal advice, insurance, touring, road information, badges, &c., will be fully supplied by the local staff and Mr. D. N. Mackay, the manager.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

THE Institution of Automobile Engineers has been incorporated and its official title is now the Incorporated Institution of Automobile Engineers.

The certificate of incorporation is dated the 17th day of July, and the licence of the Board of Trade has been obtained for the omission of the word "Limited." The memorandum and articles of association are signed by Colonel R. E. Crompton, C.B., Dr. H. S. Hele-Shaw, and Messrs. Dugald Clark, M.Inst.C.E., W. Worby Beaumont, M.Inst.C.E.,

The Glidden Tour.—A Peerless Car ploughing through an American road.

Mervyn O'Gorman, M.Inst.C.E., F.C.A. Coventry, and T. B. Browne.

The memorandum and articles, together with a list of members, are now being printed, and can be obtained, together with forms of application for membership, from the secretary of the Institution, Mr. Rees Jeffreys, 1, Albemarle Street, Piccadilly, W.

BERKSHIRE.

SIR GILBERT and Lady Clayton-East were at home to members of the Berkshire Automobile Club, at Hall Place, near Maidenhead, on Saturday.

Four of the events in a motor gymkhana, which was the principal part of the afternoon's programme, resulted as under:—

Tilting at the Ring.—Winner, Major E. R. Portal (16-h.p. Fiat); second, Mr. A. C. Clarke (10-h.p. Siddeley); third, Captain W. Waring (25-h.p. Brasier).

Potato Race.—Winner, Mr. A. C. Clarke; second, Major Portal; third, Mrs. Portal (10-h.p. De Dion).

Blindfold Driving.—Winner, Miss Muriel Thompson (25-h.p. Austin); second, Major Portal; third, Dr. Norman H. Joy (6-h.p. Siddeley).

This latter test of skill gave rise to much amusement. Each competitor was started alone, at a distance of 75 yards from the finishing flag, with the back of the car towards that flag, and the results were most ludicrous in some cases. Nearly every competitor lost the sense of direction or length, some driving entirely off the gymkhana ground, and others stopping before they had gone 20 yards, in the belief they

were at the finish. Miss Thompson came to rest at a point only 39ft. from the post in 25 sec. Ladies took the prizes in nearly all cases, as these were awarded to passengers wherever practicable, and it was required by the rules that ladies should tilt, throw the potatoes, and run for the chairs. The aggregate scores proved that Major Portal had won the Motor Union medal.

NORTHAMPTONSHIRE.

THE hill climbing competition arranged by the Northamptonshire A.C. took place on Saturday, the 24th inst., near Newnham; the hill chosen was over three-quarters of a mile long with gradients in some parts of one in seven, the average being about one in eleven. The following were the competitors:—The Rev. W. Seggins Pratt, 6-h.p. Rover, driven by Dr. Lewis; Rev. W. S. Pratt, 16-24-h.p. Fiat, driven by Mr. H. Mobbs; Mr. J. C. Hannah, 24-h.p. Minerva; Mr. A. Wickstead, 10-12-h.p. Humber; Mr. C. Wickstead, 30-h.p. Humber; Mr. J. C. Hipwell, 14-16-h.p. Fiat, driven by Mr. H. Mobbs; Col. Foster, 18-24-h.p. Fiat, driven by Mr. H. Mobbs; Mr. H. Nichols, 24-h.p. Darracq; Mr. H. R. Greening, 24-h.p. Minerva; Dr. W. L. Dryland, 7-h.p. Panhard; Mr. C. L. Wilson, 10-12-h.p. Humber.

There was an exceedingly good muster of members and their friends and the weather was all that could be desired. The details of the hill climb were left to a sub-committee, comprising the chairman, Major P. E. T. Hibbert, Dr. O'Rafferty, Colonel Mulliner, Mr. Sidney Harris, and Dr. A. A. Hope, who acted as hon. secretary, and the great success of the meeting was owing, in a very large extent, to the very able manner in which he carried out his onerous duties. The arrangements made by the police, under Inspector Harris, to protect the public were all that could be desired, everything passing off without the slightest inconvenience or risk of danger to anyone. Sir Chas. Knightley, Bart., acted as judge, Mr. A. Noel Mobbs as timekeeper, Dr. A. A. Hope as starter, and Mr. Sidney Harris as clerk of the course. The results were worked out on the following formula by Dr. Hope

Time \times R.A.C. h.p.

Weight

and Mr. Noel Mobbs, whilst the members and their friends were refreshing themselves with tea at the Wheat Sheaf Hotel, Daventry. After tea they were made known, and the winner of the prize, Mr. H. R. Greening, was heartily congratulated on his success, all who witnessed his clever performance thinking he thoroughly deserved first place.

Below are given particulars of the five best performances.

Name of Car.	H.P.	Owner.	Driver.	Time m. s. formula.	Place on
Minerva	24	H. R. Greening...	Owner	1 22 ... 1	1
Minerva	24	D. P. Taylor	J. C. Hannah	1 39 ... 2	2
Argyll	16	Dr. Henshaw	Owner	2 3 ... 3	3
Minerva	24	J. C. Hannah	Owner	1 37 ... 4	4
Fiat	14-16	J. C. Hipwell	Mr. H. Mobbs	2 9 ... 5	5

MANCHESTER MOTOR CLUB.

THE annual reliability trial for motor-cycles, fore-cars, &c., of the Manchester Motor Club was successfully carried out on Saturday and Sunday last. The route lay from a point near Bowdon to the Snowdon district of North Wales. The distance of each day's trial was approximately 100 miles. A start was made about nine on Saturday morning. The number of competitors was twenty-four. Of this total nineteen went the course on the first day without a single tyre trouble, and nine of them without losing a single point. The aggregate result was very satisfactory, as fourteen machines completed the two days' trial, and all but two qualify for club standard medals. Two dead heats took place for first and second positions, and in the case of the first will necessitate another trial before the holder of the Triumph Vase can be found. Messrs. Gross and Tyler both went through the complete trial without the loss of a single point, and Messrs. Davies and Butler only failed by one point each. The result is as follows:—J. Tyler and O. Gross 100 points, J. S. Davies and P. H. T. Butler 99, J. E. Rees 98, H. Hurst 97, H. H. Madin 91, H. Reed 89, W. Andrews 85, W. Heaton 85, C. E. Kettle 84, and A. Moorhouse 82. O. Gross drove a motor-tricycle and H. Hurst a tri-car carrying a passenger.

YORKSHIRE A.C.

ON Saturday the members of the Yorkshire Automobile Club held a hill-climbing competition over seven furlongs on Greenhow Hill, at Pateley Bridge, near Harrogate. The road was in excellent trim. The gradient averages one in twelve, but in two places it is as stiff as one in six. Thirty-one cars competed.

The competition was divided into three sections, the first being for cars whose horse-power, rating by the R.A.C. formula, did not exceed 10. In this class A. Towler, of Ilkley, who drove an 8-h.p. De Dion, was first, and A. Farnell, of Bradford, was second on a 6-h.p. Rover. In the section for cars not exceeding 24-h.p. T. H. Woollen, of London, whose 15-h.p. Clement-Talbot was driven by J. W. Edge, was the winner, and T. H. Hall, Leeds, with a 10-12-h.p. Argyll, driven by T. A. Hall, was second. In the class for more than 24-h.p. there was a dead heat for the first place between T. H. S. Atkinson, Leeds, whose car, a 15-20-h.p.

Clement-Talbot, was driven by F. Blake, and A. Farnell, of Bradford, who drove a 30-h.p. Daimler. J. T. Hemmingway, Leeds, whose car, a 30-40-h.p. Daimler, was driven by T. Walker, was second. The best times were done by Cecil Edge, London, who covered the distance on a 60-h.p. Napier in 1 min. 29 sec., and F. A. Bolton, of Osmotherley, on a 45-h.p. Daimler in 1 min. 34 + 5 sec.

NORTH-EAST LANCASHIRE.

THE annual gymkhana in connection with the North-east Lancashire Automobile Club was held on Saturday at Stanley Grange, Hoghton, near Preston. There were thirty-one entries for the eight events. Results:—Starting and stopping competition: 1, R. Birtwistle; 2, P. J. Broadley. Musical chairs: 1, Mrs. E. A. Riley; 2, Miss Huck. Motor-house—Men: 1, J. Robinson; 2, A. E. Crowley. Women: 1, Mrs. E. A. Riley; 2, Miss Kitty Crook. Academy stakes: 1, A. Birtwistle and Mrs. Walker; 2, R. Crossley and Mrs. Whittaker. See-saw competition: 1, R. Crossley; 2, A. E. Crowley. Bending race: 1, A. E. Crowley; 2, Dr. Stephenson. Doll dressing: 1, Mrs. Riley; 2, Dr. Stephenson.

HERTFORDSHIRE.

THE Members' Driving Test, arranged for to-day, has been postponed until the 21st prox., when it will take the place of the meet at Hatfield.

The Members' Hill Climb will take place on September 7th, at Aston Hill, and not at Aldbury Hall, as formerly announced.

MOTOR-CYCLE UNION OF IRELAND.

THE members of the Dublin centre of the Motor Cycle Union of Ireland held their concluding series of speed trials at Portmarnock on Saturday, when two events were run off. The course was not in as good condition as usual, nevertheless interesting sport was furnished by the two races. The results were as follows:—Two Miles Members' Handicap.—Final Heat—J. G. Drury, 34-h.p. Triumph, 25 sec.; 1; R. Hewison, 22-h.p. F.N., 50 sec.; 2; W. Ladley, 34-h.p. Morehampton, 28 sec.; 3.—Twenty Miles Members' Handicap (for the Kavanagh Cup).—C. B. Franklin, 24-h.p. J.A.P., 4 min.; 1; J. G. Drury, 34-h.p. Triumph, 3 min.; 2; R. Hourson, 24-h.p. F.N., 8 min. 30 sec.; 3; R. Walshe, 22-h.p. F.N., 7 min.; 4; P. Hurse, 24-h.p. Morehampton, 8½ min.; 5.

THE British Empire Motor Trades Alliance has now been absorbed by the Society of Motor Manufacturers and Traders, Ltd.

THE Sheffield A.C. will hold a pace judging run over a 22 mile course, from the Town Hall, on Saturday, the 7th prox., commencing at 2.30 p.m.

AUTOMOBILE ACCIDENTS.

THE Rev. Theodore Berger, rector of Wiveton, Norfolk, was driving in a trap through Kelling to Weybourne, when he met a motor-car, which his horse refused to pass. It bolted, but Mr. Berger got it under control, and was returning to the Weybourne road when he met another motor. The horse again bolted, and the wheel of the trap colliding with a post, Mr. Berger was thrown out on his head. The motorists at once started off in search of a doctor. Mr. Berger, however, never recovered consciousness, and died within an hour.

THERE has been a serious collision on the road from Angmering to Arundel between a motor-car and a pony and van. The collision occurred near the Poling cross roads.

A FATAL motor-car accident occurred at Cromer on Saturday. Miss Bertha Birch, of Wymondham, who had been staying at a convalescent home, stood outside the gates, and, after a bus had passed, stepped into the roadway. The driver of a motor-car, the approach of which Miss Birch failed to notice, endeavoured to avoid her, but she was carried a short distance and the car ran up a bank and turned over, the four occupants being thrown out. Miss Birch was so seriously injured that she succumbed in the hospital a few hours later.

A MOTOR-CAR, driven by Mr. Frank Shearman, of Penarth, who was accompanied by his wife and child and chauffeur, ran into the balustrade of the English Bridge at Shrewsbury. The stonework of the bridge was partially dislodged and the car badly damaged.

A SINGULAR accident occurred at Limerick Floating Docks on Saturday. A motor-car plunged over the quay into 24 ft. of water. Observing his danger the driver jumped from the car before it went over the quay into the basin of the dock.

ON Sunday a motor char-a-banc owned by Messrs. Joseph Tomlinson and Sons was travelling along the Manchester road in the direction of Sheffield with twenty-nine passengers when a sad accident occurred. On the long ascent to Moscar a horse drawn carriage passed the conveyance. Arrived at the crest of the hill, and with the gradient favourable, a speed of some six or seven miles an hour was attained. The carriage however, was overtaken, and the driver thought he could pass it. The vehicle was accordingly steered over to the wrong side of the road and brought alongside the lighter vehicle. Then the disaster happened. The vehicle had to pass a telegraph pole, and it appeared as though this would be safely done. The front wheels of the char-a-banc and the first seats passed safely, and then the third seat was swung against the pole, and the heads of a male passenger and of a young boy he was hold-

ing up in his arms were literally smashed in by the force of the blow. Other seats caught against the pole and caused the car to swerve and skid along the greasy road. For some ten yards it tore along and then it crashed into the wall immediately below Mr. E. Bramley's residence. The passengers shot forward, and those on the right-hand side of the char-a-banc were thrown to the ground. As a result three were killed and ten were injured.

A CAR hired by Mr. A. Graham, of Lyson Hall, Long Melford, collided with a wagon on the Newmarket road at Bury St. Edmunds, the other day, and was damaged, while one of the passengers was seriously hurt. The car was towed to Mr. T. Nice's garage in the town for repair.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

TRALEE MOTOR GARAGE COMPANY, LTD.—Capital, £3,000. To acquire the business of motor-car agent, dealer in and hirer of motor-cars, cycles, and accessories carried on by Mr. T. J. Goodlake at Edward Street, Tralee, co. Kerry. The first directors are Capt. T. J. Goodlake, 4th Battalion Royal Munster Fusiliers, and Mr. J. E. J. Julian, Killybeg, co. Kerry, barrister-at-law.

WAYTE BROTHERS, LIMITED.—Capital, £18,000. To acquire and carry on the business of Messrs. Wayte Brothers, 11 and 12, Lemon Street, Dublin, dealers in cycles, motor-cars, &c., and hirers of motor-cars. Directors: Messrs. A. R. Wayte, J. B. Wayte, W. C. Roberts, and Major Wellesley. Registered office: 36, College Green, Dublin.

HAYWARD AND SLADE.—£1,005. To take over the business of motor engineers, &c., carried on by Messrs. J. Cornish-Bowen and A. G. Slade at Hyde Street, and 82, Parchment Street, Winchester, as Hayward and Slade. 76, Hyde Street, Winchester.

A Case of Sour Grapes.
Motorist (whose car has broken down) to his chauffeur: "Those fellows are going too fast."
L'Omnia.

SOUTH-EASTERN MOTOR SUPPLY COMPANY.—First directors, Messrs. C. A. Lloyd, F. Wyatt Ediss, J. W. H. Dew, and R. S. Currie. King's House, King Street, E.C.

NILMELIOR (ENGLAND), LTD.—This company was registered with a capital of £5,000, to acquire the sole agency for the British Empire for the sale of accumulators, magnetos, contact coils and other articles for the ignition of explosive engines and accessories thereto, and other goods manufactured by Société d'Electricité "Nilmelior" (formerly Bassee et Michel), of Paris, and to carry on the business of dealers in electrical goods and appliances of all kinds.

INTERNATIONAL AUTOMOBILE CO-OPERATIVE ASSOCIATION.—£2,000. To indemnify the Automobile Co-operative Association, Ltd., against all losses it may incur in carrying on in Italy or other places outside the United Kingdom the business of manufacturers, sellers, and buyers of automobiles and their accessories, &c.

NEW ENGINE (MOTOR) COMPANY.—£50,000. To adopt an agreement with J. C. Mort and G. F. Mort, and to carry on the business of manufacturers of and dealers in motor-cars and machinery, parts, fittings, and accessories, &c. No initial public issue. First directors: Messrs. J. C. Mort and G. F. Mort. Acton Hill Works, Acton, W.

LA SOCIETE METALLURGIQUE DE MONTBARD-AULNOYE, of Montbard (Cote d'Or), France, which is making a speciality of forged steel pistons for petrol motors, send us a list illustrating and describing the same. The steel pistons are claimed to possess many advantages over those of cast iron, not the least of which is their relative lightness, which enables a higher piston speed to be attained, so increasing the power developed by the motor.

CASES UNDER THE MOTOR CAR ACT.

APPEALS.

The Motor Union has decided to support two appeals by motorists against convictions by the Godalming Bench of Magistrates for driving to the public danger. In the first case it was alleged that the motorist covered the measured distance of 220 yards at the rate of eighteen miles an hour, and that the second travelled at over twenty miles an hour. The defendants maintained that no one was endangered and that the speed was exaggerated. The constables in both prosecutions admitted in cross-examination that the cars appeared to be under perfect control. The evidence having been thoroughly investigated by the Legal Cases Committee, the Union has decided to make a financial contribution towards the costs of each of the appeals.

ON THE FOOTPATH.

At Slough, on the 14th inst., Frederick H. Lincoln, The Grange, Old Windsor, was fined £2 and £1 0s. 6d. costs, for driving a motor-car on the footpath at Eton. Leave to appeal against the conviction was asked, and granted.

EXCEEDING LEGAL LIMIT.

Fined at Bradford for exceeding the legal limit, a motor-cyclist has pleaded in extenuation of the circumstance that he had been used to driving in the London parks.

Lord Kenyon was charged at Crewe, on Monday, with driving his motor-car at an excessive speed. Superintendent Pearson stated that on July 28th. his lordship's car was timed between Crewe Station and Wistaston, and the speed was thirty miles an hour. Lord Kenyon did not dispute the police evidence as to the speed his car was going, but he was not aware he was travelling so fast. The Bench fined his lordship £5 and costs.

HEAVY HAULS.

At Kingston, on the 22nd, D. Resta was fined £3 for exceeding the ten mile limit in Richmond Park. Two others were similarly fined for similar "offences." Four motorists were fined sums of from £3 to £10 for going beyond the twenty mile limit.

At the Leeds City Court three motorists have been fined £9 and costs at one sitting.

On Tuesday five motorists were fined sums aggregating £33 10s. in addition to costs at Arundel.

Fines of £5 and costs have been imposed on each of four motorists at Selby for exceeding the legal limit at Haddesley. At Tenbridge on Monday, five motorists were summoned, and, strange to relate, one case was dismissed, the fines in the others totalling £8.

At Tonbridge on Tuesday six motorists were fined £39 and costs for exceeding the legal limit at Southborough.

Fines amounting to £28 were imposed at Atherstone on Tuesday.

Eight motorists were caught in a police trap at Chawton and fined sums amounting to over £25 at Alton Petty Sessions on Tuesday.

A LICENSING MATTER.

Mr. H. Van Cutsem was summoned at Godalming, on Monday, for having employed Wallace Molesworth, an unlicensed person, to drive a motor-car at Godalming on June 29th. P.c. Galloway said when he stopped Molesworth an occupant of the car said his name was Van Cutsem, and that he was the owner of the car. Molesworth was subsequently convicted for driving without a licence. The motor-car registered at the offices of the L.C.C. showed that the registered owner of the car was Harry Harcourt Van Cutsem, of Norfolk Street, Park Lane, W. Mr. Triggs Turner, solicitor for the defence, maintained that the onus rested upon the police to prove that defendant knew Molesworth was not licensed. The magistrates held that the onus rested upon the employer to see that his driver was properly licensed. Defendant was fined £3 3s. and costs. Notice of appeal was given.

A Reminiscence of the Kaiser's Prize Race.—Spectators' cars being drawn out of the swamp, near the Grand Stand, by cattle.

[Allgemeine Automobil Zeitung.]

Earl Poulett was showing a new motor-car to a friend in St. James's Park when he, not thoroughly understanding the car, altered the gear so that the car covered a measured distance at a speed equal to twenty-three miles an hour. "His lordship is a very careful driver, and has never been fined before," said counsel at Bow Street on Monday, but the magistrate imposed a fine of £3 and costs.

DANGEROUS DRIVING.

In fining C. P. Parker, of Bridgwater, £5, and J. Billings, chauffeur, of Burslem, £10, on Monday, for driving motor-cars to the public danger, the stipendiary magistrate at Hanley said the accident was due to the desire of Billings to get in front of Parker and escape his dust. He had not considered the public a bit. Staffordshire was the county above all others for motorists who were gentlemen at the wheel and who considered others. If a man could see a mile, or part of a mile, ahead on a clear road, there was not the slightest danger if he went twenty, thirty, or forty miles an hour, but, on the other hand, it might be dangerous to go ten or six.

At the Hove Borough Bench, on Monday, Sidney Gibson was summoned for driving a motor-car in a manner dangerous to the public at Hove on August 2nd. After a long hearing the magistrates dismissed the case.

NO LICENCE.

John Hilton was summoned as the owner of a motor tri-car at Esher for failing to produce his licence when requested by a constable in uniform on August 5th. P.a. Stringer said the defendant drew up at the Coburg Arms, and witness pointed out the absence of an identification plate, and defendant could not show his licence.—Defendant, who now produced a licence which was taken out on August 6th, was fined 10s. and 10s. 6d. costs.

THE AUTO CYCLE CLUB'S SIX-DAY TRIAL.

LAST week we recorded some of the earlier experiences in the six days' reliability trial of the Auto Cycle Club. During the event two hill climbs were held, one on Broadway Hill, Worcester, on Friday of last week, and the other on Saturday, the 24th, on Birdlip Hill.

The trial concluded at Staines on the evening of Saturday, the first arrival being at 5.15 p.m. and the others following in rapid succession, until twenty had arrived.

Those who completed the trial were F. Cozens (10-h.p. Lagonda tri-car), A. J. Sproston (5-h.p. Vindec Special), W. G. McMinnies (5-h.p. Vindec Special), D. G. Gilmour (9-h.p. Bat), A. S. Phillips (5-h.p. Vindec Special), W. H. Wells (5-h.p. Vindec Special), T. H. Hastings (4-h.p. Indian), W. G. Pople (3½-h.p. Triumph), F. C. Dee (5-h.p. Vindec Special), J. H. Slaughter (3½-h.p. Triumph), T. Woodman (3½-h.p. Vindec Special), M. Geiger (6-h.p. N.S.U.), J. Marshall (3½-h.p. Triumph), B. M. White (3½-h.p. Hazel), W. Smith (1½-h.p. Motoasocche), R. Moore (3½-h.p. Phelon and Moore), E. S. Myers (3½-h.p. Triumph), J. D. Hamilton (3½-h.p. N.S.U.) S. W. Carty (3½-h.p. N.S.U.) and F. C. Mustard (3½-h.p. Triumph).

Mr. T. H. Hastings, who rode the Indian motor-cycle, is a member of the Crescent Athletic Club, of Brooklyn, and a prominent motor-cyclist of the United States.

CAPTAIN NEAVES, of the Royal Albert, Southsea, has written to Ariel Motors Ltd., stating that he has run his Ariel car for 35,118 miles now, and, with the exception of a new third speed gear, this is the first time the car has been laid up for repairs of any sort. Those now necessary simply consist of a new piston ring.

BRITISH EXPORTS OF MOTOR-CARS AND PARTS.

In the monthly figures issued by the Board of Trade regarding the exports of motor-cars and parts from this country only the gross totals are given, no indication being afforded as to the destination of the same, nor of the quantities taken by the different countries. The more detailed return of the export trade of 1906 has just been issued, and, although somewhat late, the following tables, which deal with the shipments of automobiles, may not be without interest:—

EXPORTS OF MOTOR-CARS OF BRITISH MANUFACTURE.

	1906.		1905.	
	No.	Value. £	No.	Value. £

THE COMMERCIAL VEHICLE TRIALS.

THE list of competitors has been slightly reduced by the withdrawal of a Darracq-Serpellet 30-40-h.p. char-a-banc from Class D, and a Darracq-Serpellet 30-40-h.p. omnibus from Class E. The total number of entries in all classes is sixty. The following alterations have to be recorded in the list of entries:—Class B, No. 3, the entry of the Albion Motor-Car Company, Ltd., has been transferred to the Lacre Motor-Car Company, Ltd., and the vehicle is a 16-h.p. 24 cwt. Lacre lorry; Class D, No. 9, Messrs. Durham, Churchill and Company, 2-ton lorry, in place of the Churchill char-a-banc; Class E, No. 20, Messrs. T. C. Aveling and Company, Ltd., have entered a Brown and Wade paraffin wagon.

A form of guarantee has been sent to entrants by which the manufacturers or dealers will undertake to list and sell vehicles or chassis, including tyres, conforming in every respect to the vehicle or chassis entered, for a period of six months from the date of the beginning of the trials at the price stated on the Club's specification form.

Of the vehicles entered, forty-seven will use petrol as fuel, five paraffin, one paraffin and petrol, three coal, three coal or coke, and one coke.

Forty, or two-thirds of the total, are of British origin, eleven of French, seven of German, and two of Italian origin.

Several makes of tyres will be employed, viz., the Bergougnon, Continental, Danlop, De Nevers, Polack, Palmer Cord, Peter Union, Sirdar, Shrewsbury and Challiner, and Turner.

With regard to the frames of the vehicles in Classes A, B, C, D, E, and F, thirty-two are of channel steel, twenty-one of pressed steel, two of stamped steel, one of reinforced channel, and one armoured wood.

THE Nizam of Hyderabad, who already owns a Daimler limousine, has placed a further order, through the Bombay Motor Company, for a Daimler 28-h.p. chassis. The India Office have also just ordered a 30-h.p. Daimler limousine of the Milverton type and an open Canley type vehicle of similar horse power and wheel base.

ROAD REPORTS.

KENT.—At Kent County Council meeting, the Bridges and Roads Committee reported that the attention of the County Councils' Association had been drawn to the damage done to roads by steel-studded bands on motor-car driving wheels. The county surveyor reported that nothing but tarred macadam sufficed to keep the material on the roads tight. The cost of this, and of tar painting to abate dust, fell entirely on the ratepayers of the districts affected. A recommendation was adopted that the county councils of Buckinghamshire, Essex, Hertfordshire, Surrey, and Sussex be invited to join in calling the attention of the Local Government Board to the importance of road authorities being protected against the heavy additional expense caused by motor vehicle traffic.

WANDSWORTH.—The Borough Council have made a trial of "Ermenite." A length of half a mile of Windmill Road was satisfactorily treated with the substance, which was applied from one of the Council's watering vans. The effect was to darken the road surface to a chocolate colour, and for the present, at least, entirely to abolish the dust.

TAR SPREADING.—The Thwaite tar road surfacing patent machines are being used in Derbyshire, Lincolnshire (it was applied to the processional roads to the Royal Show at Lincoln), Berkshire and Surrey.

AYRESHIRE.—The Secretary for Scotland has declined to accede to local representation for the restriction of the speed of motor-cars passing through High Fenwick. The road board meeting at Ayr has decided to remit the matter to the Standing Committee of the Council to see if anything further can be done in the matter.

EGHAM.—At a meeting of the Egham Urban Council complaint has been made of the excessive speed of cars through the main street, which in places is less than 30 ft. in width. It was decided to work in conjunction with the Chertsey Council to secure regulations as to slower speed through the two towns. Police action against motorists who exceed the limit may shortly be expected.

The 30-40-h.p. Crossley car just supplied by Messrs. Jarrott and Letts to the Duke of Sutherland, President of the Royal Automobile Club, for his personal use at Dunrobin Castle.

The idea is that the driver is comfortably enclosed and protected from the weather, the car having all the advantages of the ordinary limousine. The back seat is hinged and folds up out of sight when not required. The body was designed by Mr. Jarrott, and the work carried out by Messrs. Salmon, of Newport Pagnell.

OXFORDSHIRE.—Oxfordshire is traversed by several important roads, which are split up into varying lengths in different districts, under different authorities, and maintained by methods which lack uniformity. The road from Banbury to Henley, via Oxford, is repaired by nine different bodies. The future cost of road maintenance, whether direct or by contract, cannot, Mr. S. Stallard, the county surveyor, thinks, fail to increase, and he anticipates that the expenditure in his county will rise considerably for some years in order to cope with the extra demands of modern traffic.

TARLITHIC is the name of a preparation for dustless roads which the Tilbury Contracting and Dredging Company (1906), Ltd., claim to be the only granite adaptable to tarred macadam and paving.

WOKING.—At the entrance to Woking, at the junction of Goldsworth Road and High Street, on the main road from Guildford to Chertsey, the Urban District Council has erected a girder bridge spanning a forty feet roadway in place of the old tunnel, which had become a kind of death trap to users of the highway.

DEVON.—The Barnstaple Rural District Council have rescinded their resolution to apply for the closing of Countisbury Hill to motor-cars.

KENT.—In his report to the Kent County Council, Mr. H. B. Maybury says that last year about £4,000 was expended upon work in connection with the laying of dust and the erection of motor-car signals.

A COMPANY has just been formed at Dover, Del., U.S.A., to manufacture Stepany spare wheels for the American market.

FORTHCOMING EVENTS.

AUGUST.

- 31st (S.).—Cardiff M.C.'s run to Chepstow.
Lincolnshire Motor-Cycling Club meet at Skegness.
East Surrey A.C. run to Chobham.
Coventry M.C.'s 100 mile reliability trial.
Motor Cycling Club's variable speed contest on Sharpenhoe Hill.
Garden party of the Somerset A.C. at Holford Rectory.

SEPTEMBER.

- 1st (Sun.).—Florio Cup race of the Italian A.C. over the Brescia circuit.
Southern M.C. picnic.
5th (T.).—Vehicles competing in the R.A.C. commercial vehicle trial must be within the gates of the depot of Messrs. J. I. Thornycroft at Chiswick by 12 noon.
Arachon motor-boat meeting.
6th-7th.—Commercial vehicle trial—examination of vehicles.
7th (S.).—Auto Cycle Club's hill climb at Birdlip.
Motor Cycling Club 200 miles reliability trial.
Bristol and Gloucester A.C. meet at Lyppiat Park, Stroud.
East Surrey A.C. run to Paddock Wood.
Southend M.C. run to Gloucester.
9th (M.).—Industrial Vehicle Trials—first day's run.
14th (S.).—Motor Union Meet at Leicester.
Brooklands A.R.C. meet.
15th.—"The Industrial Motor Review" for September will contain a pictorial and descriptive report of the Commercial Vehicle Trials of the R.A.C.
21st (W.).—Nottinghamshire A.C. hill climb.
Southern M.C. Hill Climb.

OCTOBER.

- 12th.—Close of the Commercial Vehicle Trials.
19th.—Gordon Bennett Aeronautical race at St. Louis, Missouri.
Auto-Cycle Club's quarterly trial.

MARCH, 1908.

- 21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

LIGHTING-UP TIMES—LONDON.

Aug. 31st—7.51	Sept. 2nd—7.45	4th—7.41	6th—7.37
Sept. 1st—7.48	3rd—7.43	5th—7.39	7th—7.34

In Glasgow the lighting-up time to-day (Sat.) is 8.21 p.m., and to ascertain the approximate times on succeeding days 30 min. should be added to the above figures; in Manchester an addition of about 16 min. is necessary.

THE IRISH TRIAL.

WE are asked by the Secretary of the Irish A.C. to announce that the Competitions Committee of the Irish A.C. have had under consideration the protest lodged by Mr. Mills, owner of the 12-16-h.p. Talbot car, against the Humber car entered in Class C, and also the protest entered by Messrs. Booth Bros., who had a 12-14-h.p. Singer in Class B, against the 14-16-h.p. Argyll in the same class, and on hearing the evidence adduced by the objectors and that of the entrants of the cars objected to, have decided that the protests must be upheld, and accordingly the Humber car in Class C must be disqualified on the ground that it was not in the committee's opinion a standard touring car, and that in Class B the Argyll car must also be disqualified as—having regard to the catalogue price—being wrongly entered in the class referred to. As a result of these disqualifications, the Talbot car entered by Mr. Mills becomes the winner in Class C and accordingly its performance has had to be considered for the purpose of deciding the winner of the cup presented by the Humber Company, with the result that on the formula its marks show it to be the winner of that cup, which has accordingly been awarded to the car referred to.

PUBLIC MOTOR SERVICES.

THE Tramway Company in Cape Town is reported to be in negotiation with the Harbour Board with a view to running a motor-bus service through the docks.

A MOTOR-BUS broke down in Fleet Street, E.C., and remained in that thoroughfare from 12.15 a.m. to 2 p.m., one day last week.

A MOTOR-COACH has started running between Blairgowrie and Kirkmichael, making two trips daily.

WITH a nominal capital of £5,000 the Coventry Motor Omnibus Company, Ltd., has been formed to establish a motor-bus service in the City of Spire.

MOTOR-CARS are running in public services between Redmarley and Gloucester and Cheltenham, on certain days of the week, and between Stampton and Malvern on another.

A NEW air compressor for mechanically inflating the tyres of motor-vehicles is being introduced by Mr. M. Scott Robinson, of 24, Norfolk House Road, Streatham, S.W.

SCOTTISH RELIABILITY TRIAL.

It would appear that, through an error in the office of the Scottish Motor Trade Association in furnishing to the Scottish A.C. the names of the members of that Association for the award of the special prize which had been offered by that association to the member thereof who made the lowest petrol consumption per ton mile over the whole trial, they included that of the Kennedy Motor Company, Ltd., Glasgow, who had some time ago ceased to be members. The mistake was only discovered some time after the public announcement that the prize had been gained by the 14-h.p. Thornycroft entered by the Kennedy Motor Company, Ltd. As the result of this the award of the prize is now made to Mr. Thomas Shaw, Dundee, in respect of his 35-45-h.p. Ariel-Simplex with a consumption of 03507 gallons per ton mile, equal to 28.51 ton miles per gallon of fuel.

MOTOR-CYCLE RECORDS.

AT Canning Town, on Saturday, C. E. Bennett beat the motor-cycle records for seven and eight miles. He made a good start, and got inside record at seven miles, doing 7 min. 53.4-5 sec., against his own previous best of 7 min. 56.2-5 sec. He covered eight miles in 9 min., or 5.4-5 sec. inside record, but in another half-mile his back tyre burst, and he was thrown to the ground, fortunately without being much hurt.

POLICE TRAPS.

CARLYLE'S village of Ecclefechan has now its police trap.
ANDOVER continues to demonstrate its antipathy to those who journey by automobile.

GRETNA GREEN has now its police trap, and care should be taken throughout the district generally.

AT Barugh, near Barnsley, a quarter of a mile trap has been established, in which three or four motorists have lately been caught.

SWANLEY JUNCTION is the scene of a motor trap.

ALCONBURY WESTON is now the possessor of a police trap for motorists, from whence they are led to the Huntingdon Petty Sessions.

THE Spaniards Road at Hampstead has its police trap.

THE Brighton road at Purley is the frequent centre of police operations in that district.

BUSINESS NEWS.

THE Vacuum Company's Mobiloil was used on the Itala car driven by Prince Borghese on the run from Pekin to Paris.

THE MOTOR HOUSE have decided to hold a special auction sale on the 12th prox., when the catalogue will consist almost entirely of Daimlers and Napiers of all types and with various bodies.

THE Sirdar Rubber Company, as hinted at lately, have, owing to the increase of business in their pneumatic tyre department, further reduced their cost of production, and are now giving 20 per cent. cash discount to users, and a substantial wholesale discount to the trade.

MESSRS. SMITH, PARFREY AND COMPANY, LTD., are agents for the sale and mounting of the A.P.S. shock absorber for motor vehicles, and also for the "Rapeasy" tyre lever, introduced to the trade at the Cordingley Motor Show in April last.

FROM MESSRS. C. A. VANDERVELL AND COMPANY, of the Warple Way, Acton Vale, W., comes a copy of the new catalogue they have just issued. The list gives full particulars of the C.A.V. accumulators, which are made in a variety of sizes and capacities, voltmeters, induction coils, switches, &c., made by the firm, while considerable space is devoted to electric lamps, which are meeting with increased use on motor vehicles. Primary batteries, as well as small dynamos with switch boards for charging batteries, also find a place in the catalogue.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

THE Motor-Car Journal.

VOL. IX]

LONDON, SATURDAY, SEPTEMBER 7, 1907.

[No. 444.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8½d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

BY the time these lines appear in print the sixty vehicles that are to take part in the Trials next week will have been officially received at Chiswick, and their examination will be in progress. Following the precedent of the Scottish Trial, a meeting of the committee, judges, competitors, and observers will be held on Friday. On Saturday a dinner will be held, at which Mr. C. D. Rose, M.P., will preside, and then at 7.30 a.m. on Monday the long journey will be commenced, the first stage being to Reading, where the vehicles are expected to arrive any time after 2.30 p.m. Considerable interest is being taken in the event, and relays of judges will accompany the procession each day. In order to anticipate any inconvenience that may be caused to competitors by non-competing vehicles following the Trials for the purpose of publicity and advertisement, the executive committee of the Trials have, therefore, decided, in fairness to the competitors, that should these commercial vehicles attend the Trials in this way, the firms owning them shall be dealt with under the terms of the following Competition rule:—"Any owner, manufacturer, dealer, agent or driver taking part in, or being directly connected with, any trial or competition otherwise than under regulations made by the Club, and obtaining extensive advertisement therefrom, shall be deemed to be guilty of a breach of these rules." This is an act of justice to the competitors.

The Motor Union at Leicester.

THE Motor Union has accepted the invitation of the Leicestershire Automobile Club to visit Leicester on Saturday next, the 14th inst. This will be the last provincial meeting of the Union this season, and a large gathering of members and representatives of the one hundred clubs included in the membership of the Union is expected. The general committee of the Union, under the chairmanship of Mr. C. D. Rose, M.P., will hold its usual meeting in the morning at the Council Chamber, Leicester, by the invitation of the Mayor and Corporation, and the committee will be officially welcomed by the Mayor (Alderman Sir Edward Wood, J.P.). In the afternoon a gymkhana will be held at the Freeman's Meadows, Aylestone Road, the proceeds of which will be given to the fund for the building of the new Guild Hall for the cripples of Leicester. In the evening the ninth provincial dinner of the Motor Union will be held at the Grand Hotel, and motorists who desire to

take part in this function should apply to Mr. Rees Jeffreys, the secretary.

On Surrey Roads.

THE Surrey Roads Rights Conservancy is now being formed, with a view to do something to prevent the excessive speed of motorists along the roads of that county. No subscriptions will be required from members, the Conservancy being, it is understood, established by some influential residents of the county, who intend to appoint representatives in each district, who will record their experiences to the central authorities with a view of taking action against motorists who are proceeding at an illegal pace. It is the intention of those responsible for the new organisation to do what they can against the recommendation of the Royal Commission with regard to the abolition of the speed limit, and to make the speed question a test problem at future elections. Verily, the way of the motorist passing through Surrey will soon be slow indeed. What with the A.A. scouts on the open road, the M.U. agents in villages, the police almost ubiquitous, and the Surrey Roads Rights Conservancy people everywhere, it will be difficult indeed for motorists to go beyond a walking pace.

By their Signs ye shall Know Them.

At a recent meeting of the Society of Motor Manufacturers and Traders, Mr. Manville, the chairman, called attention to various cases which had been brought to his notice of reckless driving by drivers of cars bearing trade numbers, and it was resolved that if any further case was reported to the Society they would endeavour to deal with it. This, we think, is a move in the right direction, and we should like the Society to go still further and endeavour, if possible, to compile a list of traders' numbers and letters. All motorists have long been aware that the most reckless and inconsiderate drivers on the road have been those on cars bearing traders' signs, and we feel that if it is known that a powerful society is going to deal with the matter, it will have a beneficent effect on irresponsible and harebrained hooligans, whose only desire is apparently to show off and render other users of the road as uncomfortable as possible.

When out touring it is not always our desire to travel at top speed and scurry over the ground to reach our destination in the quickest of time, but rather to enjoy the beauties of the country and discuss with our passengers the many and varied charms of nature and scenery which unfold as on a panorama while the car speeds on its way. About a fortnight ago we were travelling steadily along on the Bath road, and a car with a red

sign came up behind. In response to the sound of the horn we drew aside and allowed the driver to pass. This did not, apparently, suit the "gentleman," and he just kept a little in front of us, so that we had the benefit of the car's dust. We slowed down, as also did the fellow in front; and this continued for several miles, until the ladies—who were three in number—complained they could not put up with the inconvenience any longer. Therefore, perforce, we had to put on speed and pass the nuisance, and that was the last we saw of him. What the man's object was we do not know; but he certainly acted the part of an unmitigated cad, and should have been reported. In future we shall do so, as we—who motor, perhaps, as much as anyone in the United Kingdom—have suffered very much in times gone by, and have had to travel faster than we desired to escape such unwelcome attentions. We trust the heads of the firms employing such men will make severe examples of them.

The New Badge of the Royal Automobile Club.

A Manual of Petrol Motors and Motor-Cars.

Chas. Griffin and Co., Ltd., London. The author deals very exhaustively with the design and construction of the various parts and types of petrol motors, no less than 150 pages being devoted to this section. After discussing the general arrangement of motors, the question of ignition, carburettors, cylinder pistons and valves, crank-shafts and cams, pumps, fly-wheels, and pipe arrangements, &c., are exhaustively treated in separate chapters. The author apparently shares the opinion of many motor engineers that the four-cylinder engine, if properly made, gives a turning moment sufficiently even for all ordinary purposes, the advantages of an increased number of cylinders being, in his opinion, obtained at the expense of considerably increased complication. We do not altogether agree with his remark that in modern cars the throttle control is usually worked by a governor, for, as a matter of fact, the tendency is nowadays in the direction of abolishing centrifugal governors and relying entirely on foot or hand levers, or both, and in some cases by so connecting up the clutch to a throttle that as the former is disengaged, the speed of the engine is automatically cut down. In connection with his remarks on ignition, too, we notice that Mr. Strickland falls into the common error of terming the contact-

maker a commutator. Apart from this his remarks on ignition will be found both interesting and instructive. Following the motor the author deals equally lucidly with the other important components of a petrol-car chassis—frame, steering gear, clutches, change-speed gear, &c., specially drawn illustrations being freely made use of to amplify the text. The work concludes with a series of tables giving a record of the results of the more important motor-car trials that have so far been held in this country, going back as far as 1899, and concluding with the Scottish Reliability Trials of 1906. In this short notice we have only been able to give but a brief indication of the contents of the work, which bears evidence of very careful preparation, and, while we may not agree with all the author's criticisms, the book is one which can be strongly recommended to all engaged in motor-car design and construction.

Diplomatists and the Car.

SOCIETY long ago set its seal of approval upon the motor-car, and the smart equipages that, dispensing with horses, now traverse the West End, are visible evidences of the position attained. Equally significant, though of a somewhat different character, is the proof to be found in some of the showrooms and salerooms of fashionable coachbuilders. For the depreciation in the value of such vehicles is even greater than that of motor-cars that have seen their best day. Official circles are perhaps the hardest to penetrate, and even the King—ardent motorist that he is—has not ventured to introduce the motor-car into a Royal procession. But it is steadily asserting itself in Ambassadorial ranks. The Austrian and Spanish Ambassadors and the Portuguese and Belgian Ministers have used automobiles when paying calls for some time past, and now the Swedish Minister at the British Court has followed suit. French, German, Russian, and Turkish representatives have yet to be converted.

Motor-Cars and Railways.

THE Traffic Superintendent of the Natal Government Railways suggests that motor-cars might be adopted in some districts in that colony. He has just written his annual report for the last twelve months, and in this points out that the provision of such a service is likely to foster traffic which might ultimately be developed to such an extent as to require the institution of a light railway. Improved postal facilities to outlying districts might also be gained by the adoption of motor-cars, and in many districts of Natal the farmers would be put into direct touch with the railways by this means. Mr. D. B. Downie, the superintendent in question, briefly tabulates the specific advantages of road-motor vehicles as (a) Reduced capital outlay involved as compared with the establishment of rail service. (b) Reduced working cost. (c) Elasticity of service, i.e., the motor-vehicles not dependent on rails; should they prove unremunerative in one district can be transferred to another.

A Judicial Warning.

AT Chester Assizes the Lord Chief Justice has been uttering words of warning to motorists who disregard the ordinary courtesies of the road, pointing the moral to the advice by sending a motor-car driver to a term of imprisonment for manslaughter. Without entering into the merits of the particular case that called forth the censure, we must accept the judge's statement as a fair presentation of the matter. Motorists must not forget—nor do the majority do so—that the lives and property of other people on the road must be respected. Accidents happen without intention, but through careless or negligent driving on the part of somebody, or possibly want of familiarity with the particular road. There is no criminal intention, but those who drive must be prepared to take the risks of their own conduct, and, often, that of other people as well. This is where much of the danger of the road is associated, and

even the most careful drivers are too frequently at the mercy of the careless. To these such salutary lessons as that just administered at Chester should prove a warning.

Hotel Methods.

DESPITE the number of people who have this year been visiting the Lake District, hotel proprietors there do not seem to be quite happy with regard to the position. Whilst motoring has taken a largely increasing number of people to see the mountains and lakes, hotel proprietors complain that it has utterly spoilt the old-fashioned method of business, which was probably extremely lucrative. They contend that those who now go in a motor-car formerly arrived in a carriage or a four-horsed coach, hired a team for most of the days, and stayed for a week or longer at the same establishment. Now, however, the motorist is able to go from place to place with comfort and celerity, and the old days of long stays are no more

The Trams at Kingston.

ONE of the organisations that have been identified with road questions might very profitably compile a list of the places in various towns where trams would be unsuitable and even dangerous. Such a category would enable the Motor Union or any other body to object to applications for tram lines being laid where it could be shown that they would prove a menace to other traffic on the roadways of the country. This certainly would be a better plan than looking supinely on the laying of such lines and then going to sleep until an accident occurred. Motorists should be on the aggressive in matters of this kind, and not merely on the defensive. We are led to such a reflection by news of the disastrous collision between an electric tramcar and a coach and four at Kingston the other day. A heavy responsibility must weigh on the heads of those who passed the plans for what we consider the most dangerous tram lines in Great Britain. To

The Pekin-Paris Run.—The Arrival of the Spyker and De Dion Cars at Compiègne, near Paris.

—to the consequent disheartenment of those managers who have not yet got out of the Nineteenth Century ways.

Naming Towns.

AMONG the curiosities of legislation in America—where every one of the United States seems to have its own notions as to the way to regard the automobile industry—is the plan adopted in Massachusetts, which may well be imitated in this country. It is there enacted that every city and town “shall erect and maintain guide posts on the ways therein or at such places as are convenient for the direction of travellers and at such forks and intersections of ways which lead to adjoining cities and towns.” These signposts have to indicate the name of the place to which the road leads, with the distance thereto, and are being generally put up as a result of recent legislation. In Britain there is a hazy sort of idea that the Post Office is responsible for seeing to this.

regulate the single lines and curves a number of men have to be employed the whole time the trams are running to wave flag signals to assure the drivers it is safe for them to proceed. The rails are watered, the macadam at the sides is generally muddy and greasy, and there is scarcely room for another vehicle to pass. The Motor Union, to whom we look for protection, should not have waited till the rails were laid, and the local authorities had secured a restriction of the speed of motor-cars to ten miles an hour—an impossible speed at any time in Kingston Town—but should have entirely opposed the laying of the trams in the streets where they are now laid. It is, alas! to be feared that nothing further can now be done in the matter unless the authorities can be persuaded to compel the tramway company to lay wood paving each side of the lines and so save, perhaps, possible injuries by “side-slips.”

THE Stepney Spare Motor Wheel, Ltd., of Lillnely, have sent us a copy of the new catalogue of the well-known Stepney spare wheel they have just issued.

The Brescia Race Meeting.

THE first of the two races—the Coppa Florio—organised by the Automobile Club of Milan was run off on Sunday last. The event was held on a 60.79 kilometre course, which, starting and finishing at Brescia, took in Castiglione and Lonato. Eight laps had to be run, giving a total distance of 485.9 kilometres (303½ miles). The conditions were the same as prevailed in the Kaiser's Prize race, the contest being open to vehicles having engines of a maximum cylinder capacity of 8 litres, and the minimum weight of the car, including racing body, tyres, mudguards, &c., was fixed at 1,175 kilogs. Other conditions with regard to wheelbase wheel track, distance behind the dashboard, road clearance, &c., were also provided for in the rules, which further require the use of artillery wood wheels, to

No.	Car.	Driver.	No.	Car.	Driver.
32.	Wolsit ...	George.	37.	Brixia-Zust ...	De Martino
33.	Isotta-Fraschini	Sorel.	38.	Gaggenau ...	Comi.
34.	Itala ...	Fournier.	40.	Junior ...	Brun.
36.	Bianchi ...	Anderloni.	42.	Benz ...	Erla.

The speedy qualities of the Isotta-Fraschini, which were to secure the honours of the day, were quickly demonstrated, for Minoia made the best time in the first lap, 34 min. 4 sec., Trucco, on a similar vehicle, being only 27 sec. behind. Twenty-nine completed the premier round, the five that fell out being Tomaselli (Bianchi), Maggioni and Conti both on Brixia-Zusts, Primavesi (Rapid) and Sorel (Isotta-Fraschini). Minoia again led at the end of the second circuit, which proved the fastest of the day—33 min. 34 sec. Trucco, however, had trouble, and fell

The Florio Cup Race at Brescia.—Trucco on an Isotta-Fraschini Car passing the Grand Stand.

which detachable tyre rims could be fitted. Forty-two entries were received, and of these thirty-four faced the starter, the absentees being Count Florio's Panormitan, a Rapid, three Aries, and three De Luca-Daimlers. The competitors were despatched in the following order at intervals of half a minute, the first man being away at 5.31 a.m., and the last at 5.51½ a.m.

No.	Car.	Driver.	No.	Car.	Driver.

16.	Benz ...	Hemery.	31.	S.P.A. ...	Appendino.

back considerably, Airoldi (Darracq) being now second, and Cagno (Itala) third. The lap proved disastrous to Durlacher (Wolsit), who failed to take the turning at the bridge at Lonato and was seriously hurt, Hieronymous, Fournier (Itala) and the Comte De Martino (Brixia-Zust). Unfortunately the latter's accident had fatal results. According to one account the steering gear of his car broke, while another report is to the effect that a tyre burst. Whatever the cause, the result was that the vehicle fell into a ditch, injuring the mechanic and killing the Count, who was pinned by the steering rod, which pierced his chest. It is also stated that his head struck against a tree. Baron de Martino was thirty years of age, and belonged to an old family of Turin, and took part in the race purely for sport.

Minoia put in another fast round, thus retaining the position as the leader at the end of the third circuit. Viton (Rochet-Schneider) was now second and Hemery (Benz) third. Only two drivers retired—Cagno (Itala) and George (Wolsit)—leaving twenty-three to enter on the fourth circuit, which saw no change

in the first two places, Demogeot (Darracq), however, displacing Hemery for the third position. There were three retirals in this lap—Schmidt (Gaggenau), Fabry (Itala), and Anderloni (Bianchi). In the fifth round two more drivers fell out—Tamagni (Junior) and Comi (Gaggenau). Minoia still led easily, with Hemery (Benz) second, the position being unchanged at the end of the sixth circuit, which saw the elimination of Brun (Junior), Ceirano, and Appendino, both of the latter being on S.P.A. cars. Hanriot (Benz) ran into the third place, this order being maintained during the seventh and final laps, which was finished by fourteen competitors, the last to fall out being Venezia (S.P.A.).

THE RESULT OF THE RACE.

Order.	Driver.	Car.	Time.		
			H.	M.	S.
1.	Minoia ...	Isotta-Fraschini ...	4	39	53
2.	Hemery ...	Benz ...	4	49	49
3.	Hanriot ...	Benz ...	4	57	47
4.	Trucco ...	Isotta-Fraschini ...	5	5	56
5.	Viton ...	Rochet-Schneider ...	5	6	55
6.	Thieulin ...	Rochet-Schneider ...	5	7	25
7.	Demogeot ...	Darracq ...	5	10	43
8.	Airolti ...	Darracq ...	5	13	12
9.	Maserati ...	Bianchi ...	5	17	11
10.	Erle ...	Benz ...	5	48	17
11.	Piccoli ...	Gaggenau ...	5	51	19
12.	Piccioni ...	Junior ...	5	52	37
13.	Wilde ...	Wolsit ...	5	54	23
14.	Gallina ...	Rapid ...	5	57	0

Minoia's average speed works out at 65.8 miles per hour, which compares with Nazzaro's 70.7 m.p.h. in the A.C.F. Grand Prix and 53 m.p.h. in the Kaiser Prize contest, which latter was run under the same conditions as the Florio cup event. The Isotta-Fraschini Company thus secure the cup presented by the King of Italy, and will also hold for a year the Florio challenge cup, which has to be competed for seven times, the trophy eventually becoming the property of the firm winning it the largest number of times. It was previously held by the Itala Company, who won it in 1905, no contest having been held last year.

The Salemi challenge cup, for the team of three cars which completes the race in the shortest time, was won by the Benz Company. In each of the first six rounds the fastest time was made by Minoia; he was delayed, however, about four minutes in the last two, in which the honours went to Hemery. Of the cars which started, twenty-three were of Italian construction, seven German, and four French, the number of those of each country which finished being respectively six, four, and four. Thus, although they failed to win the race, all the French cars which competed succeeded in covering the eight rounds.

In connection with the oft-discussed question of transmission, we note that of the thirty-four cars which started twenty had live axles while fourteen were provided with side-chains. Of the former only six finished the race, as against eight chain-driven cars, the proportions being:—Live axles, 30 per cent.; and chains, 58 per cent.

The second of the races—the Coppa della Velocita—was held over the same course and distance, on Monday, the event being open to all types of petrol cars, irrespective of weight or power, and run on a petrol allowance basis, viz., 30 litres per 100 kilometres. Seventeen entries were received, but only the following fourteen started, being despatched at minute intervals:—

No.	Car.	Driver.	No.	Car.	Driver.
1.	Lorraine-Dietrich	Duray.	8.	Itala	Fabry.
2.	Diatto-Clement	Buzio.	9.	Bayard-Clement	Alezy.
3.	Itala	Cagno.	10.	S.P.A.	Raggio.
4.	Bayard-Clement	Garcet.	11.	Lorraine-Dietrich	Rougier.
5.	Darracq	Demogeot.	12.	Itala	Fournier.
6.	S.P.A.	M. Ceirano.	13.	Bayard-Clement	Shepard.
7.	Lorraine-Dietrich	Gabriel.	14.	S.P.A.	E. Ceirano.

All the fourteen vehicles finished two laps, at the end of which Fabry (Itala) was leading, with Shepard (Bayard-Clement) second, and Duray (Lorraine-Dietrich) third. In the third round M. Ceirano and Raggio, both driving S.P.A. vehicles, retired, the former owing to hot bearings and the latter to a damaged cylinder. Fabry still held the lead, followed by Duray and Shepard in the order named. Cagno (Itala) was, however,

travelling at a rapid pace, and in three circuits had improved his position from eleventh to seventh, his time for the third lap, 31 m. 31 sec., being the fastest of the day. Fabry fell back to third place in the final round, Duray taking up the running, with Shepard close on his heels. Halfway through the race rain fell heavily, and most of the competitors stopped and fitted non-skids to the wheels of their vehicles. The fifth circuit saw the disappearance of Buzio (Diatto-Clement), Fournier (Itala), E. Ceirano on the third S.P.A., and Shepard (Bayard-Clement). The latter is stated to have skidded and run off the road down a steep bank. The car was smashed, and Shepard sustained a broken collar-bone and severe injuries to his back. The chauffeur got off with slight wounds. Although Duray was still first, Cagno was now second, being only five minutes behind, and Demogeot (Darracq) third. Duray skidded in the sixth lap near the bridge at Lonato, and is said to have deranged his steering-gear. His luck was out, however, for although he struggled on his car burst into flames on the next round, forcing him to retire. Fabry also gave up owing to engine troubles. Cagno had now run into the first position, which he held to the end, the race being a battle royal between him and Demogeot. The former, however, held his own well, and finished the winner by just over three minutes.

Mr. J. Toulmin at the wheel of the Straker-Squire C.S.B. Car.

Mr. Toulmin has recently accepted the position of manager of Messrs. Straker-Squire, Ltd. Curiously enough Mr. Toulmin bought his car a few days previously to his being offered and accepting the position of manager of the car department.

The appended table shows the order and times of the six cars which completed the contest:—

RESULT OF COPPA DELLA VELOCITA RACE.

Order.	Driver.	Car.	Time.		
			H.	M.	S.
1.	Cagno ...	Itala ...	4	37	36
2.	Demogeot ...	Darracq ...	4	40	43
3.	Rougier ...	Lorraine-Dietrich ...	4	45	31
4.	Gabriel ...	Lorraine-Dietrich ...	4	50	35
5.	Alezy ...	Bayard-Clement ...	4	53	58
6.	Garcet ...	Bayard-Clement ...	4	59	22

Cagno, whose average speed works out at 65.7 miles per hour, practically the same as that of Minoia on the Isotta-Fraschini on the previous day, thus secures the first prize, which consists of the Coppa della Velocita, valued at £1,000.

As has already been mentioned, the race was run on a fuel limit basis, 145.8 litres being served out to each competitor. Rougier only used 114.75 litres, Garcet 118.7 litres, while Cagno consumed 137.86 litres, and Demogeot 139.47 litres. The gold medal offered by the French Automobile Club for the lowest petrol consumption thus falls to the Lorraine-Dietrich Company. While victory remained with Italy, the record for reliability again went to our neighbours across the Channel, who had five cars finish out of seven entered, while of the seven Italian vehicles only one—the winner—finished.

CONTINENTAL NOTES.

A Strike of Parisian Motor-Cab Drivers.

The number of motor-cabs in Paris has been increasing by leaps and bounds during the past few months, and there are stated to be now over a thousand plying for hire, against only 300 a year ago. Whether this increased number has reduced the daily takings of the drivers is not known, but the discontent which has been prevailing resulted in a strike on Friday last week, when 450 cabs belonging to the Compagnie Francaise des Automobiles de Place did not leave the garage, the chauffeurs refusing to take them out unless the company restored the old rate of 15 per cent. on the takings, which had been reduced to 12 per cent. The strikers claim that their demands are justified by the rise in the price of petrol, which falls on them, as they have to provide their own fuel. This increased price, they say, means a daily loss of 2s. to them. Another grievance is the rule enforced by the company whereby a driver who runs over a pedestrian has to pay a fine of 60 fr. if it is his first accident, and double that amount if the misfortune befall him a second time, while a third offence results in dismissal. The directors of the company decline to do away with these fines, which they

conditions as this year's race, it is reported that manufacturers are to be encouraged to use alcohol as fuel in place of petrol.

A Private Road for Motor-car Racing.

The latest proposal of the Marquis de Dion, which has been taken up by the Competitions Committee of the A.C.F., is that a private circuit, at least twenty-five miles round, should be secured, on which to hold trials of cars. The projected course will not take the form of a special racing track, but will be an ordinary road, preferably in a hilly district.

Belgian Motor-car Imports and Exports.

To the end of July last the imports of foreign motor-cars and parts into Belgium this year had attained a value of £113,584, as contrasted with only £97,484 in the first seven months of 1906. During the same period the exports of motor-cars and parts from Belgium increased from £235,464 to £260,188.

Some of the Motor Vehicles being despatched by train from Paris for use in connection with the French Military Manœuvres in the Bordeaux district.

consider a wholesome safeguard, while they attribute the drivers' diminished receipts to the general slackness of this time of the year.

The Pekin-Paris Run.

The remaining three vehicles—the Spyker and two De Dions—which took part in the Pekin-Paris run safely arrived in the French capital on Friday of last week. The travellers were met by a large party of motorists at Enghien, from whence the journey was continued in a sort of triumphal procession, the route being thickly lined by interested spectators. The party met with a further ovation at the offices of the “Matin,” while in the evening a banquet was held at the A.C.F.

Motor Vehicle Trials in France in 1908.

At the meeting of the Competitions Committee of the French Automobile Club last week, it was decided to recommend that a reliability trial of industrial vehicles should be held by the A.C.F. at the end of April next, and that the contest known as the Coupe de la Presse should again take place. While the last-named event will probably be run under the same con-

Miscellaneous Items.

An Automobile Club has just been formed at Trieste, Austria.—A new dust-laying preparation, known as Apokonin, and introduced by the C. F. Weber Gesellschaft, of Plagwitz, near Leipzig, is being experimentally tried in various parts of Germany.—The Fiat Company have lately taken out a patent in respect of a petrol motor, the direction of running of which can be reversed at will.—The Automobile Club du Rhone, of Lyons, is organising a hill-climbing competition for the 22nd inst. It is to be held on a five-mile course, from the village of Valla to the Croix de Chaubouret.—A series of one and five-kilometre speed trials is to be held on the Salon-Arles road on Sunday next, by the Automobile Club du Provence.—Reports from various centres show that the number of motorists, especially Americans, who have this year been touring on the Continent is unprecedented.—A motor-cab service is being started in Prague, Bohemia. The vehicles are of the Laurin-Klement 12-14-h.p. two-cylinder type.—A 24-h.p. Lorraine Dietrich has just successfully climbed Mount Prarion (Switzerland). The mountain, which is 1,860 metres high and is opposite Mont Blanc, has hitherto been considered impossible for automobiles.

Under Cader Idris and Snowdon to Chester.

BY JOHN LL. WARDEN PAGE.

(Continued from page 575.)

THERE is plenty to see in Carnarvon, which is quite a large town for North Wales. There are the well-preserved ruins of a castle, the finest south of the Border, and, for all I know, north of it, there are bits of the Roman walls of an older Carnarvon that called itself Segontium, and a good deal of the later ones built by Edward the First, who commenced the castle. A pleasant after-dinner stroll may be enjoyed by the Menai Straits or in the semi-wild public gardens. Last, but not least, there are good hotels.

You will be told in Carnarvon that the Eagle Tower (the one with the three turrets) was the birthplace of the first Prince of Wales. Don't believe it. He was born in the town and actually built the tower. The Castle has had a chequered history. That famous Welsh rebel Owen Glendwr attacked it, as he did most other castles in these parts, but failed. In the Wars of the Roses it was in the hands of both Yorkist and Lancastrian. The Roundhead took it from the Royalist and the Royalist from the Roundhead. Ultimately the latter prevailed, and an order went forth for its demolition. Luckily the order was not carried out and the magnificent ruin still towers over the little harbour.

From Carnarvon we turn eastward and follow the Menai Straits past Port Dinorwic, near which the Romans are said to have crossed into Anglesey, where they pretty well exterminated the Druids who lined the opposite shore. Beyond Port Dinorwic the road passes away from the straits, and Vaynol Park shuts out Stephenson's great tubular bridge that carries the railway. The road goes on to Bangor, but we may get back to the straits, and at their prettiest spot, by turning to the left and dipping down to the Holyhead road at Menai Bridge.

This Menai Bridge, over which the famous old Holyhead road is carried into Anglesey, is, as all the world knows, a suspension, and spans the rushing tide at a height of a hundred feet. An old writer tells one or two amusing stories about its construction. After the first chain had been carried across it appears that three workmen had the temerity to traverse the same, which, as the curve was one of nearly 600 ft., was sufficiently foolish. However, even this did not satisfy one of the trio, who, seating himself upon the chain, made and finished a pair of shoes. Over this very risky job he took two hours, and sold his work for a sovereign, "being led to suppose," finishes our author, "that the shoes were purchased for public exhibition in the British Museum!"

The scenery about the bridge is beautiful. On the one hand the wooded hillsides of Carnarvonshire drop steep to the water's edge; on the other rise the more gentle slopes of Anglesey, with the long village of Menai Bridge trailing away along the Beaumaris road. The narrow channel is gay with yachts and pleasure craft and a tramp steamer struggles slowly against the tide westward. Beyond her we see the stern lines of the tubular bridge, which to a great extent has nowadays deprived the suspension bridge of its occupation. For, before the railway

came, all travellers for Ireland *via* Holyhead had to cross by the latter.

Bangor lies in a deep valley at the back of the hill, and sees little enough of the straits except from its suburb of Port Penrhyn, where the slates are shipped that come down from the great quarries of Bethesda. There is nothing much to see there—Bangor I mean—except the cathedral, and this is little more than a large parish church. Wherefore, away once more, steering carefully down the narrow, winding street, for there is a good deal of traffic, and out again into the fine open country past the modern Norman castle of Lord Penrhyn and his pretty model village of Llandegai. Here the good Holyhead road swings sharp to the right for Shrewsbury and London town. We have had but a few miles of it, worse luck! for it is one of the best

highroads in the kingdom. But beware of it on a Bank Holiday. I once emerged upon it on a Whit Monday evening, coming from Festiniog way. I had quite lost sight of this popular festival: Bank Holidays do not greatly disturb the mountain recesses of Cambria, but I soon had cause to remember. Car after car rushed by, and as there had been no rain for about two months, for many miles I breathed dust by the bushel.

That Whit Monday, by the way, was a bad day for motorists. I dined that evening with three men who were held up for putting on speed to escape the very storm that had delivered me from the dust nuisance. As I surveyed the world from the hotel steps another motorist was being handed over to the police by an irate driver whose signal to stop he had disregarded, while earlier in the day a car drove into the Workhouse milk van with the result that in about two minutes

the streets of the little town were flowing with milk—though whether the speech of the man in charge flowed with honey is another matter.

From Llandegai onwards our course lies over the Chester road, and a good road it is. As far as Conway, fifteen miles from Bangor, it runs gloriously between the mountains and the sea. On it or near it there is a good deal to interest anyone but a record breaker. Near Aber village, for instance, are Aber Falls, though the upper part of the glen is not to be negotiated by motor-car. Still the fine sheets of falling water are worth a little walking. Just beyond is Llanfairfechan, a seaside resort with a lovely country at the back, and good quarters at the Castle Hotel. Then comes Penmaenmawr, another watering-place, which is reached by a sudden and sharp rise over the great sea slope of the mountain from which it takes its name. We look right down upon the waves, two hundred feet below, and have a splendid view of the bay stretching from the Great Orme's Head to Anglesey. At Penmaenmawr the Fairy Glen and Sychnant Pass are both worth a visit, and both can be reached by car. The remaining four miles into Conway, at the very feet of the mountains and on the very edge of the sea, are delightful, but there are more cliff cuttings and one or two gradients are rather sharp.

At the Gates of Conway Castle.

Who shall describe Conway? The old place sits upon a sunny eastern slope surrounded by its mediæval walls, while the tide flows to and fro beneath the towers of a castle that for beauty has no equal in Wales. Like Carnarvon, Conway Castle was built by Edward I.: unlike Carnarvon, Conway began by bringing the King bad luck. For while he was himself in it the Welsh lay siege to the place and, only just in time, did a fleet sail up the estuary to save him from starvation or surrender. In fact, the Royal family of that period seem to have had a bad time hereabouts. For at Deganwy Castle, across the river (of which only fragments remain) Edward's father, Henry, was also beleaguered and even in worse case than his son. "We faste for want of meate," writes one of the garrison, "for a halfpennie loaf is worth three pence: we starve for colde, wanting our winter garments, having no more thanne a thin linen cloath betwixte us and the winde." So quotes the "Gossip Guide," and a better gossip you cannot have.

MOTOR VEHICLES IN THE FRENCH MILITARY MANŒUVRES.

SOME important trials in the way of employing motor-wagons in the commissariat department of the 18th Army Corps are being made in connection with the French military manœuvres in the Bordeaux, Angoulême and Limoges districts, which commenced on the 4th inst., and will extend to the 14th inst. It was estimated that forty lorries capable of carrying a load of three tons would be required, and manufacturers of such vehicles were invited to submit suitable vehicles on certain terms, the principal item of which is an allowance of 86 centimes per horse-power per day, the War Department supplying the fuel, lubricating oil and grease. Two men were to be supplied with each wagon; they are being paid two and a half francs per day, and the time they

Motoring in Wales.—A Six-Cylinder Hotchkiss Car at the Bridge of Aberglaslyn.

We cross the river by the Suspension Bridge and hie us to Llandudno, which, being only a few minutes off the main road, of course no motorist will pass by on the other side. And Llandudno is, believe me, a very good place at which to put in a night. There are first-rate hotels and always something in the way of entertainment. The run round the Great Orme, too, is one of the finest marine drives in the Kingdom. It is private property, but the toll is not excessive.

(To be concluded.)

MESSRS. S. F. EDGE, LTD., have just issued a neat illustrated catalogue of the motor-car accessories they recommend for use in connection with Napier vehicles. The list includes lamps and headlights, electric motor horns, lubricating oil, the Jones speedometer, spare tyre cases, tyre inflators, jacks, Castle induction coils, the Napier combined footstool and tool box, &c.

are on duty is being reckoned as part of their military service. In response to the invitation no less than thirty-two vehicles were placed at the disposal of the authorities, viz.:—Three De Dion-Bouton, one Auto-Commerciales, one Empress, one Mors, one Panhard, two Darracq-Serpollet, one Turgan, one Peugeot, three Cohendet, two Brillié, two Lorraine-Diétrich, one Aries, one U.D.P.X., six Berliet, one Delaugere-Clayette, one Pantz, and four Purrey. Eight other vehicles belonging to the War authorities—two each Darracq Serpollet and Gillet-Forest, and one each De Dion, Mors, Delahaye and Turgan—are also being employed—so that no less than forty motor lorries are being used in connection with transport work in the manœuvres. In order to obviate the long journey by road from Paris to Bordeaux, the vehicles, noteworthy among which are two six-wheel wagons—a Brillié, and a De Dietrich, were by order of the War Office conveyed to the scene of operations by a special train from Ivry on Sunday last.

THE MORS 15-20-H.P. LIVE AXLE CAR.

ONE of the Mors Company's productions of the current year, which has attracted considerable attention, is the new 15-20-h.p. model, owing to it being the first live axle vehicle this old-established concern has turned out. We are this week able to present some illustrations of the new machine,

by high-tension magneto located on the same side of the motor as the valves; it is gear driven and arranged so that it can, by unscrewing a single nut, be readily removed. The sparking plugs are located directly over the inlet valves. The water circulation is maintained by a novel design of pump driven by a

Fig. 1.—View of Valve Side of Mors 15-20-h.p. Engine.

an examination of which will reveal that great care has been taken in its design.

The frame is of pressed steel, and is curved upwards at the rear so as to allow of free movement of the back axle. It is narrowed in two places—at the front seat, and again just forward of the dashboard so as to permit of a large lock—rendering the car suitable for town use. A feature of the engine (Fig. 1) is that all four cylinders are in one casting; the bore is 90 mm. and the stroke 100 mm.; 15-h.p. is developed at a speed of 1,000 revs. per minute. The valves, which are interchangeable, are all mechanically operated off a single cam shaft. Two large inspection plates are fitted to the under side of the crank case, so that the working parts of the motor can be easily examined and, if necessary, adjusted, without dismantling being necessary. A special feature of the car is the carburettor, which is provided with two separate jets and mixing chambers. The small jet is

Fig. 2.—View of rear portion of chassis of Mors 15-20-h.p. car, showing the three-quarter Elliptic Springs, the strong back axle casing, and the system of bolting the springs to the axle.

only used when starting up the engine or when the latter is running light—that is, with the throttle nearly closed. On opening the throttle for more power the small jet is cut off and the larger one brought into operation, the reverse operation taking place when the speed of the engine is cut down. The ignition is

Fig. 3.—The Contracting Band of the Mors metal-to-metal Clutch.

cross-shaft set in front of the crank case, a coupling being provided to admit of easy detachment. The radiator, behind which an air-inducing fan is provided, is of the ribbed tube type; a supplementary water tank is placed inside the bonnet on the dashboard. The throttle is controlled by both hand and foot levers, while, in addition, the clutch is so connected up with it

Fig. 4.—Bird's-eye view of chassis of Mors 15-20-h.p. car from rear.

that as the latter is disengaged the motor is automatically slowed down. With a view of allowing the burnt gases to steadily expand, the exhaust pipe increases in diameter as it approaches the silencer. The lubrication is effected by means of a pump driven off the cam shaft and located below a sump in the base

chamber. The pump draws the oil from the latter and delivers it to the sight feed lubricator on the dash, when it is distributed to the various bearings.

The clutch (Fig. 3), which is very simple in design, is of the metal-to-metal type. Under the action of a clutch spring, a steel cone is pushed forward between two ball-pointed bolts A, carried on levers, which tighten two steel bands, lined with cast iron segments, on to a steel drum bolted to the flywheel. No end

Fig. 5.—Sectional View in plan through one of the Rear Wheel Hubs of Mors 15-20-h.p. Car.

thrust is imposed on the crank-shaft, and provision for instant adjustment is provided. A short universally-jointed shaft connects the clutch with the gear-box. The latter, which is suspended at three points, is adapted to give three speeds forward and a reverse, controlled by a single lever working in a "gate." The pinions are extra wide, and the sliding members for the first, second, and reverse speeds are of the multi-feather type, and cut from the solid. The final transmission is by a cardan shaft and bevel gear to a rear live axle. The cardan shaft is provided with universal joints at both ends, that at the rear being also free to slide in the sleeve bearing of the short bevel driving shaft. A torque rod of  pattern is used, the double end being coupled to the top and bottom of the differential casing. The fore end is fixed to the transverse member, supporting the rear of the gear-box through a special thrust bracket. The live axle has only the driving effort to withstand, the weight of the car being carried by the axle casing.

As regards the brakes, a hand lever controls metal-to-metal expanding brakes working within drums connected to the hubs of the rear wheels, the clutch being automatically taken out when the hand brakes are applied. A pedal on the right-hand side of the steering pillar actuates a contracting brake on the forward end of the cardan shaft, where a ratchet sprag is also provided. Ball bearings are fitted to all parts of the transmission, as well as to the steering pivots. The front axle is of H-section steel, and the steering gear is of the worm-and-sector type arranged to give a large lock. The springs, which are very long, to give easy riding, are, at the front, of the semi-elliptic type, while, as will be seen from Fig. 2, three-quarter elliptics are fitted at the rear. The chassis is adapted to receive any type of open or closed side-entrance body.

At the London Guildhall on Monday a case was reported of an alleged lunatic chauffeur who was detained in an infirmary too ill to make an appearance.

A CONFERENCE of local authorities in New Zealand has passed a resolution calling upon the Government of the colony to revise the present regulations with regard to motor-cars.

SOME USEFUL NOTES.

THERE are always a great many things to be gone over in putting a car into commission for another season's use after it has been laid up for some time. If it is possible to give all of them the proper attention, so much the better, but there are some that should never be overlooked on such an occasion, and among these an overhauling of the lubricating system easily heads the list. This is more particularly the case where it is characterised by the use of a number of small bore tubes constituting the separate feeds. It is almost impossible to so place the latter that they will not have some part of their length horizontal, and any tendency of the oil to gum in the tubes or any sediment deposited will be concentrated at such points. Even though the tube be otherwise free, the film of oil that coats its interior surface when the feed stops may have hardened, thus reducing its bore considerably. The leads should be dismantled and, if possible, live steam blown through them. Where not available, plugging one end of the tube and filling it with petrol which is allowed to stand in it some time, will serve as an excellent cleanser. It should be supplemented in either case by pushing a piece of wire through the tubes to make certain that they are clear throughout their length. Similar attention should be paid to the interior of the lubricator and the sight feeds, while the crank-case should be drained and flushed with paraffin to clear out all traces of the old oil, the same process being applied to the cylinders, thus insuring a start at the beginning of the season with an absolutely clean lubricating system throughout.

WIRE cables operating the brakes and the driving belts of the radiator fan and lubricator on a new car stretch rapidly at first, and may require an adjustment after a short period of use. When this has been done a long period of service may elapse before another tightening is required.

Fig. 6.—A Mors 15-20-h.p. car with landaulet body.

THE motoring beginner will do well to start his driving by selecting for his place of practice an unfrequented and wide road, so that he has plenty of room, should he make a mistake, to correct any error without damage. With plenty of space in which to navigate, one can readily learn the exact effect of applying the levers and pedals and of manipulating the steering wheel.

THE George and Railway Mews, Ltd., of Winchester, have motor-cars for hire, and at the George Hotel garage, stock petrol, tyres, &c.

At the Manchester County Police Court the chairman of the Bench told a motorist on Monday that he and his fellow-magistrates had always held that twelve miles an hour was fast enough for motor-cars in Manchester and the suburbs.

MOTORISTS calling at the offices of the M.C.J. in Charing Cross Road, W.C., with their cars are informed that one side of the road is "up" for the wood-paving relaying.

ALTHOUGH the Motor Car Act has been in operation since 1903, it was not until last week that the first charge against a motorist for furious driving in Spalding was heard at the local Petty Sessions.

MOTORISTS passing through Lichfield will find Messrs. Jones' garage a first-class up-to-date establishment, where experienced men are kept on the premises night and day. Accessories of every description are carried in stock.

MESSRS. EYRE, of St. Leonards-on-Sea, have lately supplied a set of their Eyre anti-skids to Mr. J. H. Exshaw, of Arcachon, France, for his 40-h.p. Berliet. The firm are shortly placing on the market an improved type of loop made from tarred wire-bound hemp cable.

HERE AND THERE.

At Durban, South Africa, Mr. M. Webster, who has been in the Scottish motor trade, has opened a motor garage. It is located in Field Street.

THE Rajah of Mudhol has ordered, through the Bombay Motor Company, a 35-h.p. Daimler car with a wheel base of 10½ ft.; it is to be fitted with a seven-seated phaeton body.

SIR MAURICE LEVY, Mr. T. R. Ferens, Mr. J. E. Sears, Mr. Vincent Kennedy, and Sir H. Kimber are among the legislators making motor-car tours during the Parliamentary recess.

MOTOR UNION signs notifying concealed turnings are being erected at Shirburn, Blankney, and Battle, and others indicating the need for special caution at Great Alfriston, Uxbridge, Highhurstwood, Welwyn, Great Missenden, and Holywood, co. Down.

Two garages in turnings from the Byars Road, Glasgow, add to the facilities possessed by the Scottish city for the convenience of motorists. One belonging to the Kelvinside Motor Company, Ltd., is in the Ashton Lane, the other is in Vinicombe Street, in the possession of the Botanic Gardens Motor Garage.

MR. ERIC BARTON, late of Messrs. Sir W. G. Armstrong, Whitworth and Co., is opening a motor works and garage in Shepperton. The premises are opposite the station, and close to the main London road. All kinds of vulcanising work will be undertaken and a large stock of motor accessories kept on hand.

Elevation of chassis of Mors 15-20-h.p. live axle car. (See page 595).

SEVERAL Irish motorists have registered their cars in English counties—in order, it is said, to possibly avoid the payment of the £2 2s. carriage duty, which might be required if an Irish number revealed the country of registration. Such a tax is not imposed in the Emerald Isle.

THE Sirdar Rubber Company are organising a competition for users of their tyres, commencing as from the 21st ult., and terminating January 31st, 1908. Six prizes are offered, including ten free outer covers and twelve free inner tubes, for the best records compiled by users of these increasingly popular tyres.

MESSRS. C. ALLEN AND SONS, of Taunton, send a card of motor routes from their town, which will be of value to motorists spending a few days within easy distance of that pleasant place. The firm gives free garage to members of automobile clubs, and have a breakdown gang with a car always ready for emergencies.

IN response to the numerous enquiries for the "Continental" Handbook for Automobilists, 1906, we are asked to announce that the entire edition of this popular Guide Book has been completely exhausted. The Continental Tyre Company, however, with their customary enterprise, are preparing a fresh edition for the coming year, which will embrace an even wider field of useful and necessary information for the tourist than the last book contained.

REFERRING to the paragraph in our last issue re machine tools in the United States, Messrs. Webster and Bennett, Ltd., Coventry, inform us that the machine mentioned for milling motor cam shafts is one supplied to the company in question by them. Messrs. Webster and Bennett have also recently shipped another of these machines and one of their automobile cam-shaft grinding machines to the Lozier Motor Company, Plattsburg, New York. In addition, they have supplied numbers of both types to the leading French, German, and Italian motor-car builders.

No doubt as a result of the opening of the Brooklands Track in this country, a large number of men have recently been engaged in rendering the Morris Park racecourse, near New York, suitable for motor track racing. The track is being cut down to a total of a mile and a quarter and is being banked, so that fast times may be expected. The surface is also being treated with a dust-laying preparation. The new track has been established by a concern known as the Morris Park Motordrome Club, of which Mr. J. G. Robbin, head of the Riverside Bank, is the president, while Mr. Walter Allen, of the De Dietrich Import Company, is the secretary. The racing details will be in charge of a committee composed of well-known automobilists, having as its chairman Mr. Alfred Reeves, manager of the American Motor-car Manufacturers' Association. The first meeting has been fixed for Friday, the 6th inst., when a 24-hour race is to be held.

THE City Garage in Worcester Street, Gloucester, is open by night as well as day.

A new depot is to be established in Northgate, Chester, by the Chester Motor Garage Company.

A new showroom and garage for the sale of all makes of motor-cars has been opened at 19-21, York Street, Belfast, under the title of William Lea (Belfast), Ltd.

THE other day we had an opportunity of inspecting a somewhat novel design of two-seated vehicle which has lately been completed by Messrs. R. Reynold Jackson and Co. The chassis has a wheel base of 8 ft. 6 in., and, being low built, with a long engine bonnet, sharply-raked steering, the two seats located well to the rear, and a circular petrol tank at the back,

the vehicle has all the appearance of a racer. The long bonnet is to some extent deceptive, for it is employed not merely to give access to the engine as usual, but also to the clutch and gear-box. The power, in the car we inspected, is furnished by one of the latest 8-h.p. De Dion single-cylinder engines with mechanically-actuated inlet valve, but the chassis is, however, so designed that it can readily be fitted with a two or four-cylinder motor. The transmission is through a leather cone clutch, three speed and reverse gear-box, cardan shaft and bevel gear to a strongly-designed live axle. Painted in a silver-grey colour, the little car has quite a racy look, and, notwithstanding its relatively low power, should be capable of attaining a very satisfactory turn of speed. We understand that Messrs. Jackson have already secured orders for several of the new vehicles from New Zealand.

THE New Engine (Motor) Co., Ltd., of Acton, W., recently delivered to Sir Thomas Brooke-Hitching one of their N.E.C. 30-h.p. cars, fitted with Alexandra body. He has been using this for touring purposes in various parts of the country, and is so satisfied with the vehicle that he has now ordered an N.E.C. 40-h.p. limousine.

AN inquest has been held at Carnforth on Samuel Everard, chauffeur to Mr. Charles Garnett, of Silverdale, who died from internal injuries caused by a collision with a landau. A verdict of accidental death was returned, the jury adding a rider requesting the owner of the land where the accident occurred to remove the hedges obstructing the road.

UNDER the Motor Car Act, 1903, the County Council of Hertford have made application to the Local Government Board for a regulation to be made to limit the speed of motor-cars to ten miles an hour on several roads and parts of roads within the urban district of Watford. Objections to the making of any such regulation may be sent in writing to the L.G.B. at their office at Whitehall, London, on or before September 12th.

It has been known for some time past that Messrs. S. Smith and Sons, Ltd., were at work on the production of a reliable taximeter of British construction for use on motor and other cabs. The instrument, which has been named the "Perfect," is now ready for the market, and we understand that already several large contracts have been secured. The device, which weighs only about 20 lbs., works on the horo-metric system, i.e., actuated by time or distance; the dial is provided with two indicators, one showing the fare to be paid in shillings and pence, and the other the extras. The operating mechanism is of simple construction, so reducing the chance of failure to a minimum, while the workmanship is of the same high grade quality as has rendered the firm's motor clocks and speed indicators so popular.

SUGGESTED new names for some English villages are Prattley Parva and Shelton-on-the-Vacuum.

AN examination of military candidates will shortly be held at the Ordnance College, Woolwich, by the R.A.C.

IT is easier for a camel to go through the eye of a needle than for a motorist to enter Brighton without being trapped.

LADY STANLEY of Alderley has placed an order with Messrs. S. F. Edge, Ltd., for a Napier 40-h.p. six-cylinder limousine.

THE Prince of Wales' little motor-car breakdown at Bolton Abbey recently reminds us that both his Royal Highness and the Princess are now enthusiastic motorists, whose only regret is that they did not take to the sport until 1902, when motoring had long been an established fashion. In the following year he had a powerful petrol automobile built to his special requirements, and from the moment of its acquisition he became a motor enthusiast. The Prince became Vice-president of the Automobile Club in 1904, and he had with him in India a complete stud of motor-cars, while the Princess took her Daimler, thus setting an example to Anglo and other Indians to patronise home products. The Prince, unlike the King, has his cars numbered. He had his 22-h.p. Daimler, with which he has carried out many tours in England, registered with the London County Council, believing that it would be less conspicuous with a number plate than if he claimed the exemption to which he is entitled.

MR. W. R. McTAGGART, of Argylls Ireland, Ltd., has just established a new motor record on an end-to-end Ireland run. He started on his 14-16-h.p. Argyll car at Mizen Head and finished at Ballycastle, doing the journey of 388 miles in 15 h. 21 min. The engine was never stopped during the whole journey. Mr. L. B. Oswald Sealy acted as observer and time-

Mr. W. R. McTaggart at the wheel of the Argyll Car on which he last week made a new End to End of Ireland Record.

keeper. The previous record made recently was 19 h. 2 min., so that Mr. McTaggart's run is a distinct improvement on earlier efforts. The roads throughout the entire journey were exceedingly rough and bad, with many culverts to negotiate. The car, as well as making this record, completed a 1,000 miles non-stop run, and the accompanying photograph was taken when the 1,000 miles were finished.

PRICE'S Patent Candle Company, Ltd., supply Motorine B, which is almost the thickest oil sold for water-cooled petrol motor-engines. This was used throughout one of the recent 15,000 miles trials. Although the lubrication was most adequate, special attention is drawn to the fact that the carbonaceous deposit was practically nil, a proof of the excellent lubricating property combined with freedom from deposit.

A MOTORIST'S CAUSERIE.

To obviate accidents from backfiring when starting a petrol engine a French writer recommends that the starting handle should be taken hold of in a special way. He places the thumb against the index finger and takes the handle between the four fingers and the palm of the hand. Should a back kick occur the hand opens readily and no injuries are received by the motorist.

In the course of a conversation with the manager of a large motor-car factory in the Midlands recently, he expressed the opinion that the majority of motor-car accidents take place at cross roads, and that if motorists generally would only exercise more care in driving there would be considerably fewer disasters to record. Only last week what might have proved a fatal accident occurred at the meeting of the four roads at the foot of the bridge at Arundel, Sussex, where two cars dashed into each other. Fortunately no one was seriously injured, although one

is supplying benzol suitable for use on motor-cars is the South Metropolitan Gas Company, of East Greenwich. If any motorists in the metropolitan district have given this a trial, perhaps they will follow Mr. Pearce's example and make known the results of their experiments.

Now that the days are perceptibly shortening the condition of the lamps, if one does much driving at night, becomes a matter of paramount importance. Apart from the tail light, which is frequently a source of worry from the fear of it jolting out, and a consequent endorsement on one's licence, paraffin lamps usually give one little trouble, and require attention only in the way of replenishment with oil and an occasional cleaning of the burner or renewal of the wick. On the other hand, acetylene lamps are frequently a source of worry as well as of illumination. It is often found that some solid particles will pass with the gas to the burner, resulting in clogging it. To obviate this, a small piece of sponge placed at the outlet of the reservoir where the gas emerges will be found useful; this soaks

Motoring in Sumatra.—Crossing the Betimees River.

[De Auto.

lady was thrown out and much shaken. In view of the large number of cars now in use, and the fact that they are met in the most unexpected places, motorists should beware of driving rapidly at cross roads, but should slow down, and have their vehicles well in hand, so as to be ready for a quick pull-up in case of emergency. There is one district I have particularly in mind where cross roads are numerous, and where extreme caution is necessary. It is that which lies between Twickenham and Staines; and, although so far no serious accident has been reported, there have been many close shaves.

THE letter from Mr. G. H. Pearce in the *M.C.J.* of the 24th ult., with regard to the use of benzol in place of petrol, was very interesting to me, as no doubt it must have been to other motorists who find their fuel bill increased almost double to what it was a few years ago. Perhaps Mr. Pearce would kindly say in what quantities he obtains his new spirit, whether it is being stored by any motor-car agents, and also, if he has it direct from the makers, what the railway charges are. Another concern which

up the moisture and likewise acts as a purifier, with most beneficial results, as only dry gas can then pass to the burner. The latter should be carefully cleared with a pricker kept for the purpose, or a piece of the finest brass wire, and then be given a good scavenging by means of a tyre pump. If much night riding is indulged in, acetylene head-lights become a necessity, and to get good results from them they must be kept clean and regularly attended to after each time of use.

THE old saying that troubles never come singly applies, I find, as a result of recent experiences, equally as well to motoring as to other things. After a series of delays due to tyre punctures and bursts the tail lamp of my car has recommenced its old tendency to go out on the slightest provocation. So troublesome has it been that I feel inclined to "scrap" my present lamp and invest in a new one, but before doing so should like to have the advice of those motorists who have experienced the same annoyance and found a successful solution of the difficulty.

ARCANUM.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE EFFECT OF WIND RESISTANCE AND WEIGHT ON SPEED.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In continuation of the recent wind resistance tests at Brooklands on a six-cylinder Napier, I had some further tests made on Wednesday last week, the car being gradually loaded to the extent of 1,036 lbs., but in this case the wind resistance was constant, the only variation being additional weight. The timing was undertaken by Messrs. F. Straight and H. H. Griffin, official timekeepers of the R.A.C. The car was designed so that the minimum of wind resistance was introduced into the tests, weights being added to the extent of 148 lbs. for each individual test.

Three tests were first made with the car stripped of all weights. The times for a flying quarter mile were as follows:—

1	...	11 1.5	seconds, equal to	80.35	miles per hour.
2	...	10 3.5	" " "	84.90	" " "
3	...	10 4.5	" " "	83.33	" " "

Loading the Napier Car for the Trial.

The full extra weight was then added, 1,036 lbs., and three more tests for a flying quarter mile were undertaken as follows:—

1	...	11	seconds, equal to	81.81	miles per hour.
2	...	10 4.5	" " "	83.33	" " "
3	...	11 1.5	" " "	80.35	" " "

The three tests with the car unladen gave an average speed of 82.865 miles per hour; the three tests with the car laden gave an average speed of 81.836 miles per hour; thus only showing a difference in speed of a little over one mile per hour, although carrying nearly half a ton more weight. The next tests over the same distance were to see the effect of weight in starting from rest, and here the addition of weight very clearly proves what a handicap it is for hill-climbing, stopping, or starting, in fact, anywhere where weight has to be set in motion or stopped.

No.	Weight of Car.	Time. Sec.	
1	...	3,084 lb.	20 4.5 sec. equal to 43.28 m.p.h.
2	...	3,232 lb.	21 4.5 sec. " " 41.28 "
3	...	3,380 lb.	23 1.5 sec. " " 38.79 "
4	...	3,528 lb.	24 sec. " " 37.5 "
5	...	3,676 lb.	24 1.5 sec. " " 37.19 "
6	...	3,824 lb.	25 2.5 sec. " " 35.43 "
7	...	3,972 lb.	26 2.5 sec. " " 34.09 "
8	...	4,120 lb.	26 2.5 sec. " " 34.09 "

The net results of the separate tests of wind resistance and effect of weight on motor-cars seems to me as follows:—For a fairly high rate of speed on the level wind resistance is the all-important factor, and the question of a few cwt. more or less makes practically no difference to

the speed of the car. For hill-climbing wind resistance is unimportant, but weight is of great importance, and every pound not only a very serious handicap to the speed of the car but represents an increased consumption of petrol.—Yours truly,

S. F. EDGE.

ANDOVER POLICE ACTIVITY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—All motorists are well advised to give the little town of Andover as wide a berth as possible, as was suggested in a letter in last week's *M.C.J.* The county police are on the war-path once more, and having high jinks, the county magistrates enjoying themselves almost to satiation. On Friday last there was quite a field day, and several unfortunates went as cheerfully as possible to their inevitable doom. The principal case was that against Mr. F. R. Davis, of Shawford, Winchester, who was charged by the police with having driven a car at a speed dangerous to the public. The defendant was driving to Andover from Shawford, and when within a few miles from Andover was unfortunate enough to come into collision with a light four-wheeled pony trap which was driven out rapidly from a right-angled bye road. The right fork of the right hand lamp bracket struck the rear wheel of the vehicle, which was overturned, the groom coming in for somewhat severe injuries. Mr. Davis and the occupants of the car did all they could for the man, and took him to the doctor at Stockbridge. Much of the evidence for the prosecution was very contradictory, and no notice taken of the fact that the car was only doing five miles an hour at the time of the accident. One valuable witness was a labourer who "worked hard for his living," and who said that at the time he was in front of his cottage smoking his pipe at 4.30 in the afternoon! The usual plea of not hearing the horn was, of course, trotted out, although sufficient evidence was forthcoming that the hooter was extensively used. Even the hardy son of the soil was so deeply engrossed in contemplation of the iniquitous new-fangled methods of locomotion as not to hear the warning note. Mr. St. Gerrans appeared for the defence, but his persuasive forensic eloquence produced no impression on the local Bumbles, and a fine of £10 and £3 10s. 6d. costs was inflicted. Notice of appeal was given, and I shall watch with interest the result.—Yours truly,

A HAMPSHIRE MOTORIST.

FINDING OWNERS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your valued paper of August 31st that a correspondent, Dr. Samways, complains somewhat bitterly of a regulation of the County Council which does not allow of the whole army of prejudiced persons interfering with motorists by supplying names and addresses of owners. He must be aware that with the large percentage of the police actively engaged in trapping motorists instead of attending to their ordinary duties, there is little chance of a driver piloting a car in an irresponsible manner for very long. He does not say whether he was personally endangered or even inconvenienced by the circumstances to which he calls attention, but I have not the slightest doubt that he could have brought this "dangerous criminal" to justice, and surely, if it costs him a shilling, it would have been worth his while.

It would be a preposterous thing if anyone was able to go indiscriminately to the authorities and get the names and addresses without any questions being asked. If this were the case we should not only be harassed by any interfering pedestrians who fancied a motorist was driving to the possible danger of anything on the road, but I can imagine our letter-boxes crammed with circulars and advertisements from firms able to make use of the motor-car registry.—Yours truly,

TOURIST.

[On this question we would point out that the County Council has no right to supply anyone with entries from its register of motor-cars without payment. The regulation of the Local Government Board on this point is as follows:—The Council shall also supply to any other person applying for a copy of the entries relating to any specified motor-car, a copy of those entries on payment of a fee of one shilling, if he shows that he has a reasonable cause for requiring such a copy.]

INCOMPETENT REPAIRERS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Recently I had an experience of repair work which, for the welfare of the motoring community, should be shown up, and an attempt made to rectify in the near future. Having occasion to have a petrol tank brazed owing to a small leakage, I took it to a firm of so-called motor and cycle engineers, in a small town in the West Country. Upon my calling for the tank in two hours' time, I found no brazing done, but a large quantity of spelter left untidily, and three inches from

the place it required brazing. Asking what it meant, I was told it had been spilt. On examining it, I found a hole two inches wide had been burnt through the end of the tank, and that I was able to push a piece of wire through in three places. This untidy spelter was meant to cover the hole that had been burnt by them, thinking I should not detect it.

The result is that an entire new end has had to be fitted to the tank, causing a lot of unnecessary expense and delay. I find that no member of the firm has had any experience of motor or cycle engineering. Is it not time that some examination was made compulsory to prevent this class of repairers from setting perfect death traps to motorists upon the road?—Yours truly,

A VICTIM.

WHEELS FOR MOTOR-CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the last issue of your interesting journal a letter appears from the K.T. Syndicate. My reply is, where there is an air cushion on the edge of the wheel, there must be a tendency to roll, which is an important factor in sideslips, besides the ever-present danger of rupturing the inner tube. For many years manufacturers, backed with unlimited capital, have been trying to produce an unpuncturable tyre, but to-day it is as uncertain and more costly than it was fifteen years ago. What is wanted is a new sort of tyre, which will combine as many of the following advantages as possible:—Reasonable cost; non-skid—without being destructive to our roads; not so fragile as to necessitate carrying a lot of spares. When such a tyre is adopted, the motor industry will go forward by leaps and bounds, for without a doubt the tyre question is, as J. Bryant says, the greatest drawback to the general adoption of motor-cars. Even the fuel question is involved, because the more generally motors are used the sooner chemists and the Government will settle the alcohol question, which would go a long way towards remedying the agricultural depression and give us a never-failing supply of fuel instead of being at the mercy of a few monopolists. Solid tyres do not solve the question; we must accept the pneumatic as the standard of resiliency. Anything that will beat it as well as eliminate the troubles I have mentioned should command attention.—Yours truly,

O. COOK.

CRAWLEY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the A.A. are doing such good work on either side of Crawley, scouring the roads and preventing motorists falling into the hands of the police, they (the police) are doing their utmost towards trapping them in Crawley High Street, through which they have two measured quarter of a mile traps and one of a furlong, and as the local people here are agitating for a speed limit through the town, motorists will do well to be on the alert, otherwise they may fall into their hands, as they hide in people's yards or doorways wherever they can secrete themselves.

Trusting this may be a little help towards preventing motorists getting caught both at Crawley and the Handcross to Crawley district, where the noteworthy Wagborne has been during the last few days.—Yours truly,

FAIR PLAY.

A ROVER CAR QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you would advise me over the following difficulty. I have an 8-h.p. Rover; the big end fell to pieces when I was bringing it home and did a certain amount of damage. I have been very careful since, as I have not had it thoroughly overhauled by the makers, they being so far away. One day I noticed a squeak and could not locate it. The motor was running badly, when hot it at times lost compression. When out on one occasion, finding it had lost compression, I put in a new exhaust valve, as I had been over all other possible causes. On starting the engine up it kept on exploding through inlet pipe—it was on half compression—the valve was adjusted all right. The trouble suddenly stopped but came back in a day or so. I came to the conclusion that the cam was in some way opening at the same time as the exhaust. On taking out the cam I found it worn like a blister on extreme corner; the exhaust part, too, had not been wearing on the centre. Would this account for the trouble? The rod that carries the arm which actuates the varying compression seems in its place and free; the arm is just flush with the inner edge of the hole for the exhaust tappet in engine casing. Do you think a new cam will put it right, and was the damage caused by the smashing up of the big end; the rod was bent and the bolts twisted up?—Yours truly,

W. D. BLANCHARD.

[Such an accident to a motor as the smashing up of the big end, involving the bending of the connecting rod and the twisting of the bolts, is almost sure to cause other trouble, and we think our correspondent would have been wise to have packed the engine and sent it straight away to the makers, for the carriage by goods train would not be much, and the firm who made the motor are the best people to tackle

such a job. From what we can gather we think it is probable that something is strained in connection with the cam-shaft, perhaps even the cam-shaft itself has got bent, or the fork that controls the sliding of the taper cams. It is not quite clear what the querist means by "wearing like a blister," but in any case a new cam will be advisable if the contour is in any way worn, or raised at the corner or elsewhere. It will be best to have the engine overhauled carefully and the cam-gear examined to see whether any part is bent, as we believe must be the case. The original cause of the trouble was undoubtedly want of sufficient oil in the crank-chamber.]

WATER CIRCULATION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you would kindly tell me if it is wise to fill the radiator of my car with cold water when the engine is very hot? If my tank and engine are very hot after a forty miles run, I should otherwise find it necessary to wait a considerable time for the water to cool naturally. By adding cold water my engines, &c., become cool very quickly.—Yours truly,

NOVICE.

[In answer to our correspondent's query re putting cold water in the tank when the engine is hot, there is no danger whatever in doing this, providing the water is constantly above the cylinder head. If the water be allowed to get below, and the cylinder became over-heated, there would be the danger of cracking the cylinder, but if care be taken to give a plentiful supply, there is no danger of this, as by putting in cold water the heat gradually diminishes.]

The 30-40-h.p. Peugeot Landaulet recently supplied to Mr. C. E. B. Long, Down End, Fareham, by Messrs. Wadham Bros., of Waterloo, Hants.

SELF-STARTING DEVICES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of August 10th there is an enquiry re "self starting devices" for motor-cars, and in reply to same I venture to give a few particulars which may be useful to your correspondent. In December, 1905, the Automobile Club of France (A.C.F.) held a competition of above-named devices, details of which were duly published in the *M.C.J.* on December 30th of that year. Briefly, there were seventeen entries, of which eleven actually competed, and these were all of foreign make, the idea having apparently been left seriously alone by English inventors. Various methods were adopted to bring about the desired results, and so far the most successful devices were as follows:—M. Isnard's Cinogene and the Mors Co.'s apparatus, these sharing the first prize of £120; next (or third place) came the device of M. Lemale; while honourable mention was accorded that of M. A. Saurer and M. Pellorce.

It is, of course, impossible to describe in detail the principles of the self-starting devices referred to, but no doubt particulars can either be obtained from the manufacturers direct, or from representatives on this side of the Channel. I may mention that Messrs. W. Lecoq McBride and Co., of 67A, Shaftesbury Avenue, London, W.C., hold the British agency for the Cinogene apparatus. Fiat Motors, Ltd., of Long Acre, London, W.C., fit a self-starter to their cars, but whether it is a device of their own, or one of those already referred to, I am unable to state.

Regarding self-starters, I believe most of them are fitted to high-powered cars, but "Montacute's" letter throws no light upon what type of car he uses, or contemplates using. There are some good small cars on the market that hardly require a self-starter, and if your correspondent in-

spects the Swift, Starling, Rover, Clyde, and a few others, I feel sure he will obtain a car which will require very little exertion to start, unless it is absolutely necessary for him that a self-starter be fitted irrespective of horse-power.—Yours truly,

FRANK STONE.

OVERHEATING TROUBLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps some of your readers can help me to overcome the overheating troubles I have lately experienced. The pump throws a stream of water over 10 ft., but, nevertheless, after travelling about three miles at fast speed the engine invariably stops from overheating, though the water in the tank never boils. I have tried the following unsuccessfully:—(1) Complete repairs to pump; (2) new coil; (3) new piston-rings; (4) new joints throughout the circulation. I begin to think that the defect must be due to "furring" of the cylinder jacket, though only a thin coating of rust is visible.—Yours truly,

L. THOMPSON.

[Our correspondent's trouble from overheating is most probably due to the "furring" of the water jacket, or, failing this, a stoppage in the return pipe from the radiator to the tank. This would cause steam to generate in the head of the jacket, and so in turn cause enough pressure to prevent the pump from keeping up the water supply. We should advise our correspondent, in the first place, to take off the cylinder, remove all the plugs, and scrape away all possible signs of furring, more especially around the valve chamber. In the event of this failing, the inside of the water tank may be found "furred" or choked around the return pipe from the radiator.]

The 30-h.p. Siddlelev 24-seated Sightseeing Vehicle which is being run in London by the Motor Jobmasters, Ltd., in conjunction with the Great Western Railway. (See page 570 last issue.)

THE CONTROL OF THE ROADS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "A.A." is evidently not a motorist. Motorists have been for years past, and are now living under the benefits secured for them by the work of the Motor Union. That body, in conjunction with the "R.A.C.," has secured against strong opposing forces the limited liberties and tolerance motorists now enjoyed. The "A.A." is a young organisation and has attempted something beyond its powers. Its system of road control is inefficient, as witness the recent unsuccessful attempt to patrol even the Brighton road on the occasion of the "A.A." run. In whatever way the "A.A." may be intending to improve there is no sufficient reason for the Motor Union to lie upon its oars and leave its own membership unprotected. As a member of all three bodies I welcome the work of the Motor Union in extending the system of road scouts, or agents, or whatever they may be termed. So long as the Motor Union increases the facilities for a motorist when using the highways, we as motorists have only to be thankful.—Yours truly,

JOHN WALLACE.

AN ENGINE QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am at present boring out a pair of water-cooled cylinders and fitting new pistons, and it is desired to bring the compression up to approximately modern practice. The bore is 3 3/16 in. and the stroke 3 in.; therefore the volume swept by piston is 23.94 cubic in. I should like to arrive at the cubic space of the combustion chamber. Of course various makers have their own ideas as to this, but I should like to strike an average. Perhaps some of your readers would give their idea as to the correct ratio between the cubic contents swept by the piston

and the corresponding cubic space of combustion chamber to suit any given volume swept by the piston.—Yours truly,

CYCLE MECHANIC.

[The average compression used in petrol motors is about 75 lbs. to the square inch, although, as our correspondent remarks, it varies according to the ideas of the makers. The tendency in modern design is to increase the pressure as much as one dare, without the risk of pre-ignition, as, of course, high compression is conducive to efficiency. The maximum limit is over 90 lbs. to the square inch, although this depends largely on the design of the engine, especially as regards the careful jacketing of the combustion head to ensure proper cooling, whilst other considerations are the piston speed, proportions of flywheel, and number of cylinders. The constant torque of a six-cylinder engine, for example, will allow of a very high compression being employed, if the water cooling is nicely proportioned. As it is difficult, owing to the shape of the crown and the pockets in a combustion head, to calculate the exact capacity of them without considerable trouble, a good way of arriving at the same is to fill up with water, and measure the quantity of this up to a certain height, when the cylinder is inverted. When this is known, and the desired compression settled on, it is an easy matter to find out how high the piston must travel to obtain it. As a gas at atmospheric pressure equals about 15 lbs. to square inch, if compressed to half its bulk will register 30 lbs., if to a quarter 60 lbs., and so on. But an allowance must be made for heat, which augments the pressure. If the engine is an old one, "Cycle Mechanic" will do well not to exceed 70 lbs.]

COIL TROUBLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—My Bassée-Michel trembler coil on a two-cylinder Panhard car Centaure engine, has been giving a lot of trouble owing to the points pitting, and hence frequent adjustments, and, as this is the second coil of the same make which has gone wrong, I intend to try another maker. Will you kindly tell me which coil you recommend? I have heard Carpentier's well spoken of. Where can I get these in London, or what other make should I try? Also can I fit, without altering ignition, a coil which does not have tremblers, so as to save the frequent adjustments? Any suggestions you or your readers can make will be appreciated.—Yours truly,

T. BEVERLEY.

[Excellent coils of English manufacture can be obtained from any of the leading accessory dealers and coil makers. Our correspondent cannot use a non-trembler coil without altering the contact breaker, substituting a trembler blade contact breaker in its place, but we should advise him to obtain a good trembler coil of English make, and no doubt he will find that he obtains satisfactory result. The name Carpentier refers to the definite type of trembler, which is fitted to many types of coils, both British and foreign. If an engine is run at a very high speed it would enable the trembler to be dispensed with, but this is not practicable for our correspondent's purpose. A new coil can be fitted without altering any of the existing arrangements on the ignition circuit.]

SOME SUGGESTED SMALL IMPROVEMENTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the general lines of motor-cars have reached a point when any radical alteration is unlikely, the time seems *apropos* to mention a few small details to the improvement of which the attention of manufacturers may usefully be directed. For a long time—practically since the establishment of the industry—it has been possible for a cyclist to purchase a machine suited to his stature. In the case of motor-cars, however, this period has not yet been reached, the vehicles nearly all being turned out, as regards the steering and controlling mechanism, to one standard, as if drivers were all of the same build.

Apart from the fact that no two persons are naturally inclined to do the same thing in exactly the same fashion, many cars are so contrived as to make the operation of driving inconvenient, if not dangerous at times, to some motorists. The length of leg, the length of arm, the height of the shoulders above the seat, and even the size of hand, all are more or less involved in the ease with which a driver may accustom himself to a certain car, not to mention habitual posture when sitting. Indeed, it is quite likely that the slouching attitude which many drivers frequently affect is due more to circumstances than to any lack of self-respect, or to laziness.

In regard to the possibilities of adjustment of the steering and controlling mechanism to suit individual requirements there are, I venture to assert, certain possibilities which have not as yet been thoroughly exhausted. For instance, numerous arrangements have been made for adjusting the position of the steering wheel longitudinally of the car, while a vehicle is made in America in which it is possible to adjust the height of the wheel above the footboard. This latter appears to be a step in the right direction and evidently can be accomplished with less risk to the mechanism than the older method of swinging the entire steering column, besides furnishing a means of adjustment in another and more necessary way.

As regards the clutch and brake pedals, these too might be made adjustable, at least as to height above the floor. I further consider that

none of the controlling devices which are requisite to ordinary running operations should be mounted on the dashboard. There are, no doubt, many other motorists who have suffered inconvenience owing to this inability to alter the position of the steering wheel, pedals, &c., who, now that the question has been raised, might express their views on the subject.—Yours truly,

T. R. HARRISON.

CORROSION OF ACCUMULATOR TERMINALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For some time past I have had a great deal of trouble in keeping the positive terminal of the ignition accumulator on my car free from corrosion; it very rapidly assumes a green colour, and on the inside a crystal formation is seen. I should be obliged if you could give me any hints how to prevent the corrosion.—Yours truly,

R. H. FLOOD.

[Corrosion of the terminals is caused by one of two actions. It may be the result of the action of acid upon the metal of the terminal, or it may be caused by electrolytic action from the passage of a very small current of electricity between the two terminals. If caused by the first action, it can be prevented by carefully cleaning the terminal with a weak solution of ammonia and water, and then with pure water. When quite clean cover the terminal with vaseline. If the corrosion arises from the second action, it requires more care to entirely remove the trouble, and as our correspondent says that his positive terminal is the one giving trouble, electrolytic action is probably the cause. To prevent this, first clean the terminal in the same manner with ammonia and water, and cover it with vaseline. Also make a groove round the stem of the lead pillar on which the terminal is mounted, and fill this groove with vaseline. Then make certain that no passage of electric current is allowed to cross from one terminal to another by thoroughly drying the space between the two, and when quite dry put a dressing of vaseline on the surface between the terminals. To ensure success the old corrosive deposit should be entirely removed, clean very thoroughly with water after the ammonia, and anoint every part that is exposed with vaseline except the surface on which the wires make contact.]

A SLOW CAR ON HILLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a Germain 8-h.p. chain driven car which is rather slow up hills. When going up the last portion of a rise I have to drop on to the low gear. The wheels are 910 by 99 mm. Do you think this the cause of the vehicle being so slow? The engine holds compression well and the timing is all right. I should be pleased if you or your readers could explain the trouble.—Yours truly,

J. H. T.

[If our correspondent had given some particulars of his gearing ratio, it would have been easier to form an opinion as to the cause of his car being slow on hills. Wheels 910 mm. (36 in.) are certainly large in diameter for an 8-10-h.p. car, but it does not follow that the car is over-gear. J. H. T. says nothing as to the speed on the level, which is most important data, as, if the engine pulls well and fast on the top gear on flat roads, he will only be "robbing Peter to pay Paul" if he puts smaller sprockets on to lower the gear for hills. He must therefore judge if he can afford to sacrifice lowering his top speed. Of course if the engine never reaches its maximum number of revolutions on the high gear, it will be advantageous to try a pair of sprockets with, say, one tooth less than at present. Anyway, it is not an expensive experiment. To alter the ratio of the bottom gear only would be very costly. As he seems to think the engine is in proper order, it is hardly any good suggesting anything in that direction; although, as probably the extra power required to make the car take hills better is only slight, it is quite likely that a good engine tester could tune it up to give the extra amount wanted.]

A LUBRICATING OIL QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall feel obliged if you can tell me the best lubricant for a 24-h.p. Fiat car. I have tried several but cannot get an oil that gives entire satisfaction.—Yours truly,

S. C. STILES.

[The Fiat Company have an oil which is specially made for them, and which has been in use by owners of Fiat cars for the past four years with entire satisfaction. It can be supplied from stock in one gallon tins.]

MISFIRING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be greatly obliged if you or any of your many readers will assist me in the following trouble. I am having difficulty with the rear cylinder of my four-cylinder car, which is fitted with the usual high-tension accumulator ignition. When the engine is running slowly this cylinder fires just when it thinks it will, which is very seldom, yet

it will repeatedly start up on it, but when this is accomplished it then remains inactive for many revolutions. When the throttle is opened, and the ignition lever in any position, it fires regularly; but as the car is very sluggish and will not climb on its top speed anything like it used to do, and also gets very hot, I attribute the loss of power to this cylinder.—Yours truly,

R. SINCLAIR.

[Our correspondent's trouble seems to point very strongly to a faulty coil; probably the condenser has broken down, or there is a bad contact on the primary. Trouble of this kind is sometimes caused by the burnt oil getting foul of the point of sparking plug, and although when tried out of the cylinder proves all right, short circuits inside when replaced. This appears to be the only suggestion, if the coil, sparking plug, &c., are correct.]

A TEST FOR WATER IN PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I hope you will find space for the following, as one who is always ready to assist his fellow-motorists in difficulties. I was stopped by a driver near Seacroft, late on a recent Sunday; he had run out of petrol and had purchased a bottle of whisky, believing it to be all right, as alcohol is advocated as a substitute for spirit. I beg to warn motorists, however, not to repeat the same unless it has been tested by a densimeter, spg. 700. In connection with this, may I mention a simple test which I used on this occasion in place of the densimeter, by putting a few drops of the whisky or petrol on a coin; if it evaporates and leaves the coin dry, it is all right. If any water has been added to it, it will remain on the coin. For a long time the engine refused to start; I tried the usual methods of testing accumulators, sparking plugs and carburettor, and pulled at the starting handle till I was tired and weary, but all in vain. The car was stopped on an incline about 1 in 14; we ran off all the petrol and secured a tin of fresh petrol, wiped out the carburettor, put a little spirit in each cylinder, and the engine started, enabling us to get the car on the level and then to a descent, when the motor again stopped and all the usual methods as before failed. I applied my rule, and it revealed the fact that there was water in the petrol. It struck me, when the car was on the incline, that when we ran the petrol off there would be some liquid left in the rear of the tank owing to the inclined position of the car. When the vehicle was on the level this mixture of whisky, water and petrol came to the front of the tank; on the next descent, which was about half a mile long, the rear wheels were at a higher level than the front ones and by the law of gravity the denser bodies were at the bottom of the tank. I disconnected the petrol feed pipe from the carburettor, raised the needle valve and made sure that all was run off, then connected up and flooded the carburettor; the motor started straight away and my fellow-motorist went on his way more than pleased.—Yours truly,

S. PICKLES.

CATALOGUE WANTED.—Mr. A. C. Clark, 4 and 5, George Street, Ryde, I. W., writes:—"Will any reader of the *M.C.J.* oblige with a list of the Leader 8-10-h.p. four-cylinder, two-seated car? It is, I find, impossible to obtain the same from makers, and the owner's car is delayed on the Russian frontier, admission being refused unless such printed maker's specification be produced."

THE MOTOR UNION AND THE AUTOMOBILE ASSOCIATION.

IMPORTANT negotiations have recently taken place between a sub-committee of the Motor Union and representatives of the Automobile Association for the purpose of discovering a scheme which would enable the two bodies to work together in close co-operation for the benefit of the automobile movement. In spite of all efforts, however, no mutually satisfactory scheme of co-operation has been devised.

The history of the negotiations is recorded in a lengthy correspondence, copies of which have been sent us by both parties. Representatives of the Motor Union have twice met the Automobile Association in conference. At the meeting of July 9th the representatives of the Association asked the Motor Union to submit a proposal for a working arrangement. The outlines of a proposal were accordingly laid before them, and the offer finally rejected on the 8th ult.

Mr. Walter Gibbons, referring to the letter from Mr. C. D. Rose, M.P., Chairman of the Motor Union, in which he states that the road agents of the Motor Union are stationed entirely in towns and villages wherein, so far as his knowledge extends, no police traps exist, asks how can he, Mr. Rose, account for the fact that these road agents or scouts are supplied with a code of signals enabling them to signal, 1, to stop; 2, to proceed cautiously; 3, all is clear. "Upon which only one construction can, Mr. Gibbons adds, be placed, that of warning motorists against police traps. If, therefore, it is not the intention of these scouts to discover police traps and give warning of their locality, why are they empowered to signal 'all is clear'?" Is it to aid motorists to dash through villages at fifty miles an hour?"

We have received from Mr. Walter Gibbons a copy of a letter he has addressed to the R.A.C. resigning his membership from the Club as a protest against the "unnecessary interference" of the Motor Union with the work of the Automobile Association.

THE MISTRAL OF PROvence.

"IT was September, and it was Provence," are the opening words of Daudet's "Port Tarascon"; but not every writer was so kind to the wonderful country, and Madame de Sevigne's exaggerated pictures of the "perfumed idleness of the Provençaux" and of the "mistral," that dread north wind of the Rhone Valley, are answered by Mr. Miltoun, who thus brings meteorology up to date in his "Rambles in Provence":—

The "terrible mistral" is not always so terrible as it has been pictured. It does not always blow, nor, when it does come, does it blow for a long period, not even for the proverbial three, six, or nine days, but it is, nevertheless, pretty general along the whole south coast of France. It is the complete reverse of the sirocco of the African coast, the wind which blows hot from the African desert and makes the coast cities of Oran, Alger, and Constantine, and even Biskra, farther inland, the delightful winter resorts that they are. In summer the "mistral," when it blows, makes the coast towns and cities of the mouth of the Rhone, and even farther to the east and west, cool and delightful even in the hottest summer months, and it always has a great purifying and healthful influence. Ordinarily the "mistral" is faithful to tradition, but for long months in the winter of 1905-06 it only appeared at Marseilles, and then only to disappear again immediately. The Provençal used to pray to be preserved from Æolus, son of Jupiter, but this particular season the god had forsaken all Provence. From August 31st to September 4th it blew with all its wonted vigour, with a violence which lifted roof tiles and blew all before it, but until the first of the following March it made only fitful attempts, many of which expired before they were born. There were occasions when it rose from its torpor and ruffled the waves of the blue Mediterranean into

One of the latest Star Six-Cylinder Cars fitted up as a special Shooting Car to carry ten people.

The vehicle is fitted with a six-cylinder engine, 4½ in. bore by 5 in. stroke, with magneto ignition and also synchronised high-tension coil and accumulator. The car illustrated has just been despatched by the Star Engineering Company to South Africa.

the white horses of the poets, but it immediately retired as if shorn of its former strength. "C'est humiliant," said the observer at the meteorological bureau at Marseilles, as he shut up shop and went out for his Apéritif. All Provence was marvelling at the strange anomaly, and really seemed to regret the absence of the "mistral," though they always cursed it loudly when it was present—all but the fisherfolk of the Etang de Berre and the old men who sheltered themselves on the sunny side of a wall and made the best use possible of the "cheminée du Roi René," as the old pipe smokers call the glorious sun of the south, which never seems so bright and never gives out so much warmth as when the "mistral" blows its hardest. A Martignaux or a Marseillais would rather have the "mistral" than the damp, humid winds from the east or north-east, which, curiously enough, brought fog with them on this abnormal occasion. The café gossips predicted that Marseilles, their beloved Marseilles, with its Cannebiere and its Prado, was degenerating into a fog-bound city like London, Paris and Lyons. At Martignes the old sailors, those who had been toilers on the deep sea in their earlier years, told weird tales of the "pea soup" fogs of London—only they called them *purées*. One thing, however, all were certain. The "mistral" was sure to drive all this moisture-laden atmosphere away. In the words of the song they chanted, "On n'sait quand y' r'viendra." "Va-t-il prendre enfin?" "Je ne sais pas," and so the fishermen of Martignes, and elsewhere on the Mediterranean coast, pulled their boats up on the shore and huddled around the café stoves and talked of the *mauvais temps* which was always with them. What was the use of combating against the elements? The fish would not rise in what is thought elsewhere to be fishermen's weather. They required the "mistral," and plenty of it.

MR. W. RODDAM DRINKWATER, recently with the technical department of the R.A.C., has been appointed sales manager to the British Motobloc Syndicate, Ltd., 12, Regent Street, London, S.W.

A 50-MILE RUN FROM BRIGHTON.

MR. HENRY MOORE, of Brighton, continues his suggestions for lane wanderings in Sussex. His latest advice is for the motorist to turn up from the sea at the Grand Avenue, and get to the Upper Shoreham Road, keeping on to Old Shoreham—six miles. The journey is continued round the serpentine turn at the Rising Sun Inn. Then through Beeding, Bramber, and Steyning care should be taken when rounding the sharp corner at the bottom of the hill in the latter village. The way should then be continued till the sign-post pointing to Thakeham is reached and the main Worthing and London road is crossed. Mounting the rising ground straight ahead, turn to the left at the first fork roads, and in a few yards there is a road cut through a fir forest. At the next fork road turn to the right, and again to the right half a mile further on. The road direct to Pulborough is to the left within a few yards. Straight on towards Thakeham is through one of the most fascinating little pieces of scenery anywhere, for the steep winding road has been cut through a ridge of rock, and rugged, verdure-clad, rocky sides stand twenty feet above the road, and are surmounted by trees, which, meeting, form an avenue of great beauty. At the bottom of the short hill beyond a glimpse of water adds still further charm. About a mile from this, at the fork roads, go to the left, and again sharp to the left at the next turn, which is another mile on, for West Chiltington, which, after a mile and a half of narrow winding lane, is approached by ascending a corkscrew bend up a very steep rise, which should be driven with care, in case a reckless driver is coming in the opposite direction. Then bend to the left on leaving the village, and keep straight on to Storrington, say four miles, where, turning to the left, the Worthing and London road is struck at Washington; at the pond go straight on to Worthing, and to Brighton along the coast.

ROAD REPORTS.

MINEHEAD.—The Urban District Council this year tarred the principal roads in the town to prevent dust, and the experiment has been so successful that it has been decided to considerably extend the system next year.

BRENTFORD.—The text of the petition which is to be presented to the King, begging for a widening of Brentford High Street, has now been finally approved, and is being sent round for the signatures of those regularly using the road.

FARNHAM.—The Farnham Rural District Council has considered a letter from Mr. P. J. Henriques, of Normandy Park, Guildford, asking for motor danger-signals to be erected in the vicinity of a cross-road near his lodge. Mr. Bryan Hook stated that he was a motorist, and he never took the slightest notice of danger signals. The signals were put up very recklessly, and were not erected where they were really wanted. They should be taken down and redistributed. It was decided to reply that in their opinion the signals were not required.

KINGSTON BRIDGE.—At an inquest concerning the death of a cyclist who slipped under a wagon on Kingston Bridge, the opinion was expressed in evidence that the wooden paved tramway track at the foot of the bridge was a danger to motorists when watered, and had caused many accidents. The jury added a rider to their verdict that the Kingston Town Council should be requested to clear the tramway track of mud at the spot before watering it.

KENT.—The Chairman of the Dartford Petty Sessions regards the corner of the road leading from Crockenhill as one of the most dangerous corners in the county.

ANSTRUTHER.—The Clerk to the West Anstruther Town Council has been instructed to write the Scottish A.C. to provide warning boards to place at the Buckie House corner, at which there has been some serious motor-car accidents.

SUTTON COLDFIELD.—The Borough Surveyor of Sutton Coldfield says that specially made roads of a dustless character would cost £1,200 per mile, a figure which he has arrived at in connection with the recent reconstruction of the Manor Road in that district. In the experiment under notice, a 2 in. layer of ashes was spread upon the scarified and lightly-rolled road surface. Next a layer of fine asphalt 1 in. in thickness was placed on the ashes, the asphalt being then covered with 3 in. of best hard granite. For two days the new metal was rolled, till finally the asphalt could be observed working up through the granite. The whole surface was then dressed with tarred chippings and well rolled.

FOLKESTONE.—The road from London to Folkestone is reported in capital order.

THE RULE OF THE ROAD.

A CORRESPONDENT recalls Lord Erskine's lines on this much-discussed subject:—

"The rule of the road is a paradox quite,
In riding or driving along,
If you keep to the left you're sure to be right,
If you keep to the right you'll be wrong.

"But in walking a different custom applies,
And just the reverse is the rule,
If you keep to the right you'll be safe, right, and wise,
If you keep to the left you're a fool."

CLUBS AND ASSOCIATIONS.

NORTH BERKSHIRE AUTOMOBILE CLUB.

By invitation of Captain and Mrs. Loder Symonds, the North Berkshire A.C. carried out a most successful meet on Saturday, the 31st ult. at Hinton Manor. The programme commenced with a hill climb on Duxford Hill. The results were decided on the formula which was used at the Aston Hill Climb.

Place.	Car.	Owner.	Marks.
1	12-16-h.p. Peugeot...	Mrs. Viner Ellis ...	302
2	40-h.p. Mercedes ...	Mr. Ivor Truman ...	352
3	10-h.p. Peugeot ...	Captain Loder Symonds	402
	15-h.p. Humber ...	Mr. H. Barrett ...	408
	9-h.p. Jackson ...	Mr. Darwin Hey ...	413
	9-h.p. De Dion ...	Mr. H. Woodward ...	439
	8-h.p. Cadillac ...	Mr. Hayward ...	501
	28-h.p. Ariel ...	Mr. E. Bond ...	522
	8-h.p. Cadillac ...	Mr. W. O. Rooper ...	648

After enjoying the hospitality of Captain and Mrs. Loder Symonds, a concours d'adresse was held in the charming grounds. This event was highly popular, as it enabled everyone to take part. It provided a driving test whilst carrying three lady passengers, whose separate duties were to carry a glass of water without spilling it, throw potatoes into baskets, and tilt at the ring. This as well as the hill climb was voted a huge success, and was won by Mr. H. Woodward with Lady Betty Bertie, Miss May Loder Symonds and Miss Hippisley.

Amongst those present were the Countess of Abingdon, Lady Betty Bertie, the Hon. Ethel Dormer, hon. treas., Mr. and Mrs. Barrett, Mr. and Mrs. Bond, Mr. and Mrs. Darwin Hey, Mr. Ivor Truman, Captain Loder Symonds, Mr. P. Fletcher, and Miss Constance Fletcher, hon. secretary.

NORTH-EASTERN AUTOMOBILE ASSOCIATION.

On Saturday, the 31st ult., the members of the above association and their friends were invited by Lord and Lady Barnard to an "At Home" at Raby Castle. This historic seat is one of the "show" places in the North of England, and about 600 acceptances of the invitation were received. The weather proved propitious. During the afternoon about 100 motor-cars, besides a large number of motor-bicycles, arrived in the park, and were arranged in rows, forming a very imposing spectacle. The whole of the castle, the gardens, and the park were thrown open to the visitors, and Lord Barnard had engaged the band of the 1st V.B.D.L.I., which played during the afternoon in the gardens.

Afternoon tea was served in the Baron's Hall, after which the prizes in connection with the Ragpath Side Hill Climbing Competition on June 15th last were presented by Lady Barnard. These included the following:—The "Barnard" challenge cup, presented by Lord Barnard for annual competition. The committee had decided this year to award it to the winner of the handicap for members' cars, and it was won by Mr. Edw. W. Leather on his 40-h.p. Berliet. A second cup was presented by the association for the fastest time made on the hill by any standard touring car, the property of the member. This was won by Mr. W. E. Galloway on his 25-h.p. Stanley steam car. Other prizes included silver medals to Mr. E. W. Leather, who won the "closed" handicap, Mr. S. F. Edge, who won the "open" handicap, Mr. E. J. Tiffen, who won the Motor-Cycle "closed" handicap, and Mr. A. Stewart, who won the Newcastle-Edinburgh reliability run on June 27th last, this competition being organised by the Newcastle Motor Club.

After the ceremony Capt. H. S. Streatfeild, chairman of the association, tendered the thanks of the association to Lord Barnard for his hospitality. To this Lord Barnard replied, stating that he himself used his car for business and pleasure rather than for sport. Mr. J. E. Hodgkin, hon. sec. of the association, then thanked Lady Barnard on behalf of the members for presenting the prizes, and the proceedings terminated.

Mr. W. Rees Jeffreys, secretary of the Motor Union, was present during the afternoon, but was unfortunately delayed in his arrival owing to some slight trouble with his car, and was therefore not able to be there in time for any conference with the members of the committee on questions affecting motorists in the north of England.

This is the first social event of this nature which has been organised by the North-Eastern Automobile Association, and, in view of the great satisfaction given to the members, it is hoped that it may be repeated in future years. The arrangements at Raby Castle, which were very complete and well organised, were in the hands of Mr. C. Fogg-Elliott, Lord Barnard's estate agent, to whom the thanks of the association are specially due.

THE AUTO-CYCLE CLUB.

THE Auto-Cycle Club have issued the marks lost on running time for the six days' trial, which was held from August 19th to 24th. The following lost no marks:—W. H. Wells, 5-h.p. Vindec; T. Woodman, 3½-h.p. Vindec; M. Gieger, 6-h.p. N.S.U.; J. H. Slaughter, 3½-h.p. Triumph; E. S. Myers, 3½-h.p. Triumph; J. Marshall, 3½-h.p. Triumph; R. M. White, 3½-h.p. Hazel; R. Moore, 3½-h.p. Phelon-Moore; T. K. Hastings, 4-h.p. Indian; W. G. Pople, 3½-h.p. Triumph; J. D. Hamilton, 3½-h.p. N.S.U.; S. W. Carter, 3½-h.p. N.S.U.; F. C. Mustard, 3½-h.p.

Triumph; D. G. Gilmour, 9-h.p. Bat; and A. J. Sprosten, 5-h.p. Vindec.

Marks were lost by W. G. McMinnies, 5-h.p. Vindec, 11; F. C. Dee, 5-h.p. Vindec, 17; J. B. Hart-Davies, 3½-h.p. Triumph, 32; F. Cozens, 10-h.p. Lagonda tri-car, 53; W. Smith, 1½-h.p. Motosacoche, 67; and A. Stanley Phillips, 5-h.p. Vindec, 112.

The following retired:—R. M. Brice, 5-h.p. Brown; J. C. Lingenfelder, 4-h.p. N.S.U.; O. C. Godfrey, 5-h.p. Rex; Eli Clark, 3½-h.p. Rex; F. W. Applebee, 3½-h.p. Rex; T. H. Tessier, 6-h.p. Bat; E. Nelson, 5-h.p. Rex; C. A. Potts, 6-h.p. Bat; W. Milnes, 3½-h.p. Phelon-Moore; W. Riddle, 6-h.p. N.S.U.; H. G. Potts, 3½-h.p. Minerva; F. Applebee, jun., 6-h.p. Rex Litette tri-car; J. V. Evans, 6-h.p. Addison tri-car; Mrs. Hewlett, 10-h.p. Lagonda tri-car; and M. W. Randle, 10-h.p. Lagonda tri-car.

SOUTHERN MOTOR CLUB.

THE Club's 100 miles Reliability Trial for Motor-cycles took place on Saturday, 31st ult., on a circular course starting from Godstone to Purley Corner, Red Hill and back to Godstone, four times round, eighteen entries being received. Six faced the starter at Godstone, viz., C. H. Pugh (4½-h.p. Stevens), T. E. Goodley (3½-h.p. Triumph), G. M. Beecroft (5-6-h.p. Vindec Special), C. Jones (6-h.p. Antoine), W. Pratt (3½-h.p. Griffon), and G. Aldington (5-h.p. Twin Kerry). The winner proved to be Mr. C. Jones, who had only two minutes' difference in comparative running on each circuit, and he took the gold medal and certificate. Mr. G. M. Beecroft was second and was awarded a certificate.

The Churchill Char-a-banc as it appeared on the occasion of the Outing given to the children of the Bradford Poor Children's Mission. The vehicle was kindly lent by Messrs. Durham, Churchill and Co.'s Bradford Agent, Mr. Walter Jackson.

WEST ESSEX.

THE result of the non-stop competition for the Gamage cup has been decided by the committee as follows:—1, V. Baldwin (3½-h.p. Brown); 2, J. C. Brown (3½-h.p. Brown); 3, C. D. Makepeace (7-h.p. Phoenix Quadcar). The next competition will be held on the 8th inst., and will take the form of a 100 Miles Petrol Consumption and Reliability Trial, from the Cock Hotel, Epping, through Harlow, Sawbridgeworth, Ugley, and Newport to the fortieth milestone on the Cambridge Road and back, a distance of fifty miles, this course to be covered twice. Minimum time two and a half hours, maximum three hours for each section of fifty miles. The start will take place at 10 a.m.

CRYSTAL PALACE.

MR. HENRY HOLLANDS has found himself compelled, through ill-health, to give up the hon. secretaryship of the Crystal Palace A.C., and Mr. F. W. Baily has been elected to the post.

The committee of the club, whilst accepting with regret Mr. Hollands' resignation as secretary, have co-opted him to be a member of that body.

SOMERSET.

At the invitation of some dozen Weston-super-Mare motorists the members of the Somerset Automobile Club have been entertained at a gymkhana and garden party given in the Recreation Grounds at that resort. There was a representative attendance, including Dr. C. J. Talbot, Messrs. H. and T. Blake, H. Spiers Houston (12-14-h.p. Achilles), Captain W. Vaughan-Jenkins, Colonel Stuart, Colonel Sherston, Messrs. C. F. Haywood (8-h.p. Rover), F. Bailey, M. B. Castle

(9-11-h.p. Clement-Talbot), S. Austin, W. Yatman, F. B. Beauchamp (30-40-h.p. Daimler), S. B. Alway (14-16-h.p. Argyll), A. W. Metcalfe, F. Clark (10-12-h.p. Clement-Talbot), H. Hipplesey, A. Armitage, F. Wills, A. E. Johnson (14-16-h.p. Argyll), F. J. Tucker (28-h.p. Daimler), H. J. Blackmore, Rev. W. R. Pearson Strange, Messrs. W. P. Paddon, R. B. Graves-Knyfton, hon. secretary of the association (14-16 h.p. Argyll), F. Blackmore (9-10-h.p. Swift).

COVENTRY.

ON Saturday last twenty-one machines participated in the Reliability Trial organised by the Coventry Motor Club for the private owners of motor-bicycles. The test included a hundred miles run with a surprise hill-climbing test. The course of the trial was from Daventry to Towcester, Brackley, Chipping Warden, Badby, and Daventry, which was covered twice. The start was made from the garage of Mr. H. Reynolds, and the run was remarkable for the even behaviour of the machines. In the end Mr. C. S. Burney (3½-h.p. De Havilland) won the Schulte cup, Mr. J. S. Harwood (3½-h.p. Triumph) the Rex gold medal, and Mr. A. B. Jenson (3½-h.p. Triumph) the club silver medal.

DERBY AND DISTRICT.

THE committee of the Derby and District A.C. have decided to hold a hill-climbing competition at Rangemore next year, when we understand an active policy with regard to competitions for members will be inaugurated.

Mr. Robert Knowles has withdrawn his recent resignation and

The above illustration depicts the change-speed gear pinions which were taken from the six-cylinder Hotchkiss Car after the recent trial of 21,250 miles. It will be seen that the wheels and shafts, which bear the seal of the Royal Automobile Club, show little, if any, signs of wear.

expresses the hope that the club will do more to look after the proper repair of the highways by the local authorities.

THE South Devon Automobile club is holding a meet at Ashburton on Saturday, the 14th inst., the headquarters being at the Golden Lion Hotel.

A MOTOR-CYCLE club for Crewe is being formed with Mr. A. R. Tatham, 39, Derrington Avenue, as hon. sec.

THE Hull Auto-cycle Club has appointed Captain J. A. Foster as chairman and Mr. T. H. Straker, 12, Percy Street, Hull, as hon. sec.

THE Daimler Company have made arrangements with Messrs. Dalgetty and Company, Ltd., Burke Street, Melbourne, who will shortly be opening garages at both Melbourne and Sydney for the sale of Daimler cars in Australia. Messrs. Dalgetty will have two demonstration cars, and also six stock vehicles, together with a large assortment of spare parts, for the convenience of the increasing number of Daimler owners in the colony.

FROM the Electric Ignition Company, Ltd., Birmingham, comes a copy of the new showcard and catalogue of E.I.C. ignitivities they have just issued. The former is of a novel and bold design and will be of interest to agents. The new list gives full particulars of the E.I.C. sparking plugs, coils, accumulators, switches, contact makers, high-tension distributors and other ignition accessories, among the new features being an improved double ignition switch.

CASES UNDER THE MOTOR CAR ACT.

A BROTHER OFFICER'S MOTOR-CAR.

At Bradford, Dr. S. Lodge was summoned for driving a motor-car without giving audible and sufficient warning of the approach of his car. The Chief Constable stated that on August 6th Dr. Lodge was driving a car near Manningham Park Gates. Colonel Sichel, who was standing near the causeway, complained that sufficient warning was not given of the approach of the car. The informant, however, was now desirous of withdrawing from the case. Colonel Sichel explained that when he laid the information he was unaware that Dr. Lodge (who is surgeon-lieutenant in the Bradford Rifles) was a friend and brother officer. The summons was withdrawn on payment of costs.

HEAVY HAULS.

At Highgate, on the 28th ult., four motorists caught in a trap at Whetstone were fined £17 and costs. A batch of six motorists have since been fined sums of £1, 18s., £4, and 4s. 10d. for passing too quickly over a police trap. The Basingstoke bench imposed fines of £24 and costs on motorists at a recent sitting. At Kingston, on the 29th ult., five motorists were fined £3 each for exceeding the ten-mile limit in Richmond Park. Six motor-car drivers have been fined in Kilnarnock court. Fines of £3 each have been inflicted on eight motorists by the Alton bench.

EXCEEDING LEGAL LIMIT.

Robert Moore, of Harrogate, was fined 40s. and costs, at Bangor, for driving his motor-bicycle during the recent motor-bicycle reliability trials in North Wales at the rate of thirty to forty miles an hour. He was reported by the local secretary of the trials.

At Stirling the authorities have obtained authority for the imposition of a ten mile limit, and the sheriff has decided that heavier fines shall be inflicted on victims in future.

A fine of £5 and costs was inflicted on the 30th ult. by the Southampton county magistrates on Mr. S. F. Edge, for driving a motor-car at a speed of slightly over thirty miles an hour at Bassett. The police evidence was not disputed, but the defendant's counsel said the road was clear at the time, and with the car in such experienced hands there was practically no danger.

Five motorists have been fined at Greenwich sums ranging from £2 2s. to £4 2s. for exceeding the speed limit. Mr. Hutton said that if these cases increased the penalties must be more severe.

OBSCURE IDENTIFICATION MARK.

Herbert B. Fitzherbert, of London, was, at Rowley, Staffordshire, fined £10 and costs for a breach of the Motor Car Act, by travelling from London to Tividale in a motor-car the identity mark and figures of which were obscured. Defendant pleaded that he left London hurriedly and a workman carelessly attached a card to the vehicle.

DANGEROUS DRIVING.

At Horsham Petty Sessions on Saturday, Percy George Gibbs, of 3, Clarendon Mews, St. Alban's Road, Kensington, was fined £5, costs £2 13s., for driving to the danger of the public at Crawley on July 28th. P.C. Scott, of Bow Street, proved a like conviction last February, and also a conviction at Kingston-on-Thames last month.

At the Llandrindod Wells (Radnorshire) Police Court, Thomas Hampson, Madley Manor, Staffordshire, was fined £3, including costs, for driving a motor-car in a manner dangerous to the public at Llandrindod on August 4th. Defendant is the chauffeur to the Earl of Huntingdon, and stated that he was driving at not more than twelve miles an hour. The statement was confirmed by the Hon. Reginald Coventry, who was in the car in company with the Countess of Huntingdon and the Earl.

Mr. Archibald Rosling, motor-car manufacturer, was charged at Thorpe (Essex) with having driven a motor-car to the public danger. Mr. Ogle, barrister, said the defendant was going at only sixteen miles an hour, but by a majority of five to four the Bench fined the defendant £2.

At Norman Cross, on Tuesday, H. B. Cresswell, of Arlington Street, London, W., pleaded guilty to driving a motor-car to the common danger at Stilton on August 3rd. He admitted two previous convictions and was fined £25 and costs. His present licence was suspended until its expiration, and he was declared disqualified from obtaining another licence for two years.

WHAT IS A SIGNAL?

What is an intelligible signal to a chauffeur was the point which the Newcastle magistrates have been called upon to decide in a case in which Walter Sanderson, the driver of a car, was charged under the Motor Car Act. Robert Ord, a farmer, was riding a hunter along the Ponteland road, when he saw the car rounding a curve a hundred yards away. He waved his hat as a signal to Sanderson to stop, but he did not. The horse began to rear and plunge, and finally bumped itself against the fence. The driver slowed down, and passed at about ten miles an hour. It was contested for the defence that the waving of a hat was a signal that no chauffeur would understand, and that Ord ought to have held up his hand, but the magistrates thought otherwise, and imposed a fine of 40s. and costs.

LACK OF KNOWLEDGE.

Paul Webb, a visitor to Malvern, who was summoned at the Petty Sessions for neglecting to stop a motor-car when requested at Malvern Wells, was ordered to pay the costs, as he was an American citizen and ignorant of English regulations.

A QUARTETTE OF SUMMONSES.

Fines to a total of £12 and costs have been imposed, at Manchester, upon Alec Stewart Fraser, manager for the Darracq Motor-car Company, 241, Deansgate, Manchester. He appeared in answer to four summonses, which charged him with driving to the danger of the public, refusing to give name or address, failing to produce a driver's licence when requested to do so, and for using a motor-car without being registered. A constable gave evidence that on July 31st, at Urmston, Fraser was driving the car, which contained three persons, at a speed of twenty or twenty-five miles an hour. When called on to stop he took no notice; he would not give his address nor show his licence. The defendant explained that he resented the manner in which the plain clothes officer demanded his name. Mr. Armitage, the presiding magistrate, ordered Fraser's licence to be endorsed, and told him it would be forfeited if he were again convicted.

NO LIGHTS.

W. H. Bolton was charged with driving a motor-car at 12.45 a.m., on July 10th, without proper lights, in Marlow. At the previous petty sessions he failed to appear in answer to his summons, to take any notice, and a warrant was issued. On his promise to attend, the London police did not arrest him. On the case being called on at the present court, defendant was not present, and the chairman said he thought he ought to have been arrested under the warrant. Later on defendant arrived, and was censured for his conduct. P.C. Young repeated the evidence given at the previous hearing, and P.C. Pheasant corroborated the same. The Bench fined him £2 and 14s. 6d. costs, and endorsed his licence. Defendant challenged the right to endorse his licence for the offence, but was promptly informed differently. Defendant said he had not the money to pay. The Chairman said he would be detained until it was paid.

AUTOMOBILE ACCIDENTS.

As the outcome of a motoring mishap, Mr. J. A. Pyne, who was mayor of Deptford last year, is lying in a critical condition at the Cottage Hospital at Colwyn Bay. Mr. Pyne, who was on a visit to the Welsh watering place, and a friend, who was driving, were riding in a motor-car along the main road of the town at a moderate speed, when a lady cyclist, who had lost control of her machine and was on the wrong side of the road, approached. To avert a collision the car was turned sharply round a hedge. Mr. Pyne was thrown forward, and his forehead came into violent contact with an angle of the wooden post, his frontal bone being smashed. He was at once conveyed to the hospital, where an operation was performed.

On Saturday afternoon an Eastbourne motor char-a-banc, owned by Mr. Ray, was being driven towards Willingdon village, three miles distant, when, at a narrow part of the road, a motor-car came down the incline. By some mischance a collision occurred, with the result that the motor char-a-banc was driven up the bank and overturned. Two lady passengers were thrown across the road and severely shaken.

An inquest was held at Croydon on Saturday concerning the death of John Osborn, of Gosport, who, while cycling on August 6th, near Purley, was thrown from his machine by colliding with a motor-car. The car was being tried for the Queen. On the chauffeur's behalf Mr. Parkes appeared, at the instance of Sir Henry White, private solicitor to the King. The jury returned a verdict of accidental death.

The Birmingham coroner has held an inquiry touching the death of Howard Millington, who sustained fatal injuries as the result of a collision with a motor-car. He was cycling behind a motor-car travelling towards Birmingham, and when it slowed down at a curve he turned into the road and collided with a car coming in the opposite direction. The owner of the car took him to a hospital, but he died on the way. A verdict of accidental death was returned, and the coroner was requested to ask the Automobile Club to erect a danger board at the curve where the accident happened.

The East Sussex police are engaged in trying to trace a motor-car which on Monday was the cause of a general smash-up on the road between Newhaven and Lewes. The motor-car, containing a lady and gentleman, encountered a wagonette and a market trap, being driven one behind the other. It passed the wagonette, but collided with the trap, knocking it over. The horse bolted, smashing the trap and cutting itself severely. One of the wagonette horses bolted and narrowly escaped a collision with some cyclists. The car continued its journey.

A MOST successful motor-cycle competitor attributes his wins very largely to the constant use of the puncture-proof band made by the Peter Union Tyre Company. This is an endless band of red rubber of fine quality, feather-edged, so that it can be inserted and remain snugly between the tube and cover, in tyres of any manufacture.

News has just been received from Natal that at the competitions held by the Natal Automobile Club at Durban recently two first prizes were won by the Napier car belonging to Mr. W. R. Poynton, one of the first motorists in Natal.

The Hotchkiss car which has lately completed a reliability run of over 21,000 miles was fitted with D.W.M. ball bearings, for which Messrs. Ludw. Loewe and Company are sole agents for the British Empire. During the long trial the bearings required no adjustment whatever.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

NORTON MANUFACTURING COMPANY.—This company has just been registered with a capital of £2,000, to take over the business carried on at Deritend Bridge, Floodgate Street, Birmingham, as the Norton Manufacturing Company, to enter into an agreement with Mr. J. L. Norton, and to carry on the business of makers of motor-cars, components and accessories.

IMPERIAL MOTOR INDUSTRIES.—£3,000. Agreement with Messrs. H. K. Nathanson and H. Petty. No initial public issue. 15, Castle Street East, W.

OPTIMA TYRES.—£1,000. To acquire English letters patent held by Messrs. Fortier, Beaulieu Jeune, of Roannes, to manufacture and sell in the United Kingdom and British Colonies articles made under such letters patent, to acquire the agency for the United Kingdom and British colonies and dependencies for the sale of motor tyres, bands, and covers. First directors: Messrs. W. H. Ellis and H. R. Wilding, both permanent, 119, Regent Street, W.

YARMOUTH MOTORS.—£2,000. No initial public issue. First directors: T. S. Robinson and E. Lewis.

QUICK CAB COMPANY.—£14,000. To acquire the sole agency for the United Kingdom and British colonies and dependencies for the sale and hire of cars built by the Societe Automobile "Ours." No initial public issue. First directors: Le Comte de Bellissen, Messrs. A. C. Dunlop, H. Michael, and W. L. McBride. 67A, Shaftesbury Avenue, W.

As will be remembered, the Heavy Touring Car race this year was won by a Humber Car. We reproduce above the certificate which has been awarded by the Royal Automobile Club to Mr. T. C. Pullinger, who entered the vehicle.

THE COMMERCIAL VEHICLE TRIALS.

ON Thursday, the 5th inst., the vehicles competing in the R.A.C. Trials were due at Church Wharf, Chiswick. That day was mainly spent in getting them sorted into their respective classes, and weighing at the North and South Western Junction Railway will begin on the Friday. While the vehicles are in this depot the judges will make an examination in order to award marks for the following points:—Accessibility, adequacy of platform area and convenience for loading, ease of manipulation, finish and workmanship, general appearance, and manoeuvring.

In order to encourage punctuality in starting, each morning of the trials, which commence on Monday next, the Club has decided to offer £5 in money and a silver medal in each class to be given to the drivers for punctuality. The judges will also take punctuality (both as regards starting in the morning and running to schedule time) into consideration in making the awards.

The Club has not been notified of any further withdrawals, so that it is expected and hoped that the full number of vehicles, namely sixty, will be presented for trial.

MAJOR A. LESLIE RENTON, M.P., who served with distinction in the South African war and was present at the relief of Ladysmith, has placed an order for a 35-h.p. Iris seven-seated limousine.

FORTHCOMING EVENTS.

SEPTEMBER.

- 7th (S.).—Motor Cycling Club 200 miles reliability trial.
Bristol and Gloucester A.C. meet at Lyppatt Park, Stroud.
East Surrey A.C. run to Paddock Wood.
Southend M.C. run to Gloucester.
Herts County A.C. hill climb at Aldbury Hill.
Scottish A.C. motor-car driving competition at Hamilton Palace.
Southern M.C.'s gymkhana at Battersea Rise House, Clapham Common.
Dinner in connection with the R.A.C. Commercial Vehicle Trials, at the Trocadero, London.
- 9th (M.).—Auto Cycle Club's hill climb at Birdlip.
Industrial Vehicle Trials—first day's run to Reading.
- 11th (W.).—Cardiff M.C. open hill climb at Caerphilly.
- 13th (F.).—Exhibition in connection with Commercial Vehicle Trials at Bristol.
- 14th (S.).—Motor Union Meet at Leicester.
Brooklands A.R.C. meet.
East Surrey A.C. run to Cranleigh.
Essex M.C. 200 miles non-stop run.
Harrogate M.C.C. hill climb.
- 15th.—"The Industrial Motor Review" for September will contain a pictorial and descriptive report of the Commercial Vehicle Trials of the R.A.C.
- 21st (S.).—Nottinghamshire A.C. hill climb.
Southern M.C. closing run at Ewell.
Auto Cycle Club meeting at Lincoln.
Derby A.C. run to Dovedale.
Blackheath A.C. run to Westerham.
- 28th (S.).—Ipswich and East Suffolk A.C. petrol consumption trial.

OCTOBER.

- 12th.—Close of the Commercial Vehicle Trials. Final run from Baldock to Dalston, London, N.
Auto-Cycle Club's quarterly trial.

MARCH, 1908.

- 21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

LIGHTING-UP TIMES—LONDON.

Sept. 7th—7.34	...	9th—7.30	...	11th—7.25	...	13th—7.20
" 8th—7.32	...	10th—7.27	...	12th—7.22	...	14th—7.18

To ascertain the approximate times in Glasgow an addition of 20 min. should be made to the above figures; in Manchester an addition of about 7 min. is necessary.

OBSTRUCTING A MOTORIST.

AT Bedford Divisional Sessions, a local carman was summoned for unlawfully preventing George Tompkins from passing on the highway at Bromham on August 2nd, and pleaded not guilty. Complainant stated that he was driving a motor-car on August 2nd, at Bromham, and was travelling towards Bedford. When nearing Bromham he saw the defendant driving a van in front of him, with three other men. The van was on the wrong side of the road, and when about fifty yards away witness sounded his hooter several times, but they did not take the slightest notice. He continually sounded his hooter, and the van completely obstructed him from passing by pulling close in. Defendant said the obstruction was done accidentally and not intentionally. He was fined 5s. and costs 10s. 6d.

PUBLIC MOTOR SERVICES.

WORTHING.—Excursions by motor-bus or char-a-banc now extend from Worthing to Brighton, Newhaven, and Seaford on the east, Littlehampton, Arundel and Bognor on the west, and to Storrington and Pulborough on the north.

THE Town Council of Eastbourne have been memorialised against the running of motor-omnibuses on the sea-front.

THE Pateley Bridge Rural District Council are up in arms against the motor char-a-bancs running on the country roads to Brimham Rocks.

POLICE TRAPS.

NEAR the Castle Howard (York) reformatory, a measured quarter of a mile has been set by the police.

JUST outside Alton, on the Winchester road, is a police trap. Another will generally be found at Lymington Bottom, Medstead.

OWING to confusion with other establishments with a similar name, the directors of the Motor Academy, Boundary Road, Notting Hill, W., have determined to change their name to that of the National Motor Academy, under which title it will in future be known.

BUSINESS NEWS.

THE New Zealand Farmers' Motor Company, Ltd., have been appointed sole agents for New Zealand for Weigel cars. Mr. Ernest Short, the managing director of the company, who has been on a visit to this country, fixed up the agency through Messrs. Tozer, Kemsley and Fisher, Ltd.

INCLUDED in the recent Godiva Procession in Coventry was the Humber Company's Silver Prize Band, the twenty-seven performers of which were accommodated on a single 15-h.p. Coventry-Humber car. They were, in fact, paraded through the streets on a platform mounted on a chassis, similar in every respect to that which the company supply for their touring cars.

A COMPANY has just been formed with the title Nilmeliol (England), Ltd., for the purpose of selling the products of La Société d'Electricité Nilmeliol, lately known as Messrs. Basée-Michel and Company, in this country. Premises have been secured at 36 and 37, Alfred Place, Tottenham Court Road, London, W., where a complete stock of Nilmeliol coils, magnetos, &c., will be carried.

THE ELECTRIC IGNITION COMPANY, LTD., have received a letter from a motorist who has been using the E.I.C. plugs in connection with a high tension magneto. The plugs are of the firm's 4 B type, and, although they are not intended for magneto work, have run the car for 4,000 miles, and the cost of fitting new points, thoroughly overhauling the plugs, and making them capable for at least a further 5,000 miles, only amounts to a few shillings.

MESSRS. HENRY ROYSTON AND COMPANY, St. James's Street, Manchester, have sent us a sample of the cloth they sell largely, made up into covers for motor-cars to protect them from dust when they are in the stable or on exhibition. The covers are usually made 160 in. wide by 200 in. in length, but any size can be supplied.

THE largest motor yet shipped to China has recently left the works of the Ailsa Craig Motor Co., at Chiswick. The engine, which is destined for a boat built at Hong-Kong, is rated at 100-h.p.; it is of the diagonal type with twelve cylinders. Magneto as well as coil and accumulator ignition is fitted; all the cylinders exhaust into a long iron tube 6 in. in diameter placed between the two rows of cylinders, and from this the gases pass into two funnels containing silencers. Along the centre of the iron tube runs a perforated pipe spraying fine jets of water, which are instantly converted into steam, thus effectively cooling and silencing the exhaust.

IN connection with the question of motor vehicles being able to turn in ordinary thoroughfares, Messrs. Mors (England), Limited, claim that their 10-14-h.p. or 15-20-h.p. vehicles (both four-cylinder and live axle) can turn round in their own length and describe the figure 8 in a roadway of usual width without approaching the kerb. Both these types can have a carriage fitted to carry four persons comfortably.

AFTER a lengthy test with Elastex-filled tyres fitted to an 18-h.p. Siddeley, the Bickford Motor Company, of Camborne, Cornwall, report that there appears to be nothing to choose between Elastex and pneumatic tyres for resiliency, and only a trivial loss in fuel consumption and speed, whilst the total absence of punctures greatly increases the general reliability of the car. "As to economy generally, we are not yet prepared to speak definitely, as this will depend on the number of covers which one filling will wear out, liability to accidental damage, &c. Even should there be no actual money saving, however, the increased reliability and total absence of tyre worry render this substance very well worthy of attention."

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, SEPTEMBER 14, 1907.

[No. 445.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

“THE INDUSTRIAL MOTOR REVIEW.”

“THE INDUSTRIAL MOTOR REVIEW,” which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

“The Industrial Motor Review” is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

THE horse has not yet disappeared from the streets of London, and had he had the advantage of an elementary school education would probably take comfort in the speech of Sir John Pount to the shareholders of the London General Omnibus Company, Ltd., the other day. The company has been put to enormous expense in complying with the stringent requirements of the Commissioner of Police with regard to motor vehicles. The competition of the various companies had resulted

in the reduction of the omnibus-miles, with serious loss to the revenue of most of the concerns. According to Sir John it is a matter of calculation with regard to certain motor-omnibus companies now running at a loss how long their financial arrangements would permit their continuing as going concerns. Some horse-omnibus companies and proprietors had already withdrawn their motor vehicles. The stud of horses belonging to the London General Omnibus Company is maintained at 14,000, the average lives of the animals being five years and four months. The concern has no more motor-buses on the road than was the case a year ago; and having regard to the serious aspect of things with regard to traffic in London it would appear that the horse has not yet entirely lost his position.

The Effect of Dust on Health.

IN his annual report to the County Council Dr. F. E. Fremantle, the Medical Officer of Health for Hertfordshire, refers to the development of motor traffic bringing a new problem to the front. He says that the effect of ground dust upon health was first discovered in the South African war, and experiments have shown that infection may and does take place through this channel. The effect of a dusty atmosphere on the respiratory organs has long been known and guarded against in factories and mines, where “miners’ consumption,” as a result of the rock-drill, is still a common danger, despite modern inventions to avoid it. Road-dust is a danger which must similarly be avoided. It is an especial danger in the Home Counties, where the quality of roads and scenery, its situation as regards through traffic, and the number of residents who work in London, are considerable factors in swelling an already exceptional motor traffic. To abate this danger to health less dust must be made, and such as is made must be less disturbed and

scattered. For this purpose new methods may be introduced for road-paving, as has been done at Rickmansworth, where dust-laying compositions appear to have been effectual, and the New Road, tarred once last summer, still shows an improvement over others. This problem is of greater importance on urban than on rural roads; and experiments in road-surface for towns may well be encouraged by medical officers on health.

Scenes in Surrey.

THE wayside Rambler rarely writes books nowadays; hence Mr. John Murray’s re-issue of “Field Paths and Green Lanes in Surrey and Sussex,” by Mr. L. J. Jennings, comes as a refreshing reminder of the pleasures that are no longer generally enjoyed. Mr. Jennings journeyed by train and on foot, chatting with wayfarers, sextons, beggars, and others who crossed his path. All these get out of the way of the motor-car; and the old time conversations have been curtailed. Still the book is of interest to those who travel through the two counties, telling them of much they have missed by keeping to the high road and leaving the bye paths to be overgrown with grass. The author’s feeling when he first saw Hindhead is worth quotation. “It is with surprise,” he says, “that in this lonely waste one sees between the Devil’s Punch Bowl and the top of the hill a fine, broad, and well-kept road; nor is that surprise diminished when you come upon it and find that it is as hard and smooth as any road in a private park could possibly be. There are very few marks of wheels to be found upon it, but abundant traces of sheep.” He looked upon the scene and wondered, “Will the tide of English summer travel ever again turn toward England itself.” We fancy the residents of that part of Surrey would answer in the affirmative.

Round Town.

MR. C. G. HARPER has obtained considerable reputation in connection with his books on various roads of the country, and his latest, entitled “Rural Nooks Round London” (chiefly in Middlesex and Surrey), is a good example of the historical phase of much of his work. Here we have a compendious history of many of the suburbs to the south-west of the city. From personal recollections Mr. Harper is able to demonstrate that London has been going westward during the last quarter of a century, and how districts like Acton were almost silent villages back in the centuries, whereas now they have become great roads of bricks and mortar. Until 1863 Londoners possessed no means of being carried from one distant

point to another across the great city other than those afforded by cabs. The cost was 9d. from Notting Hill to Charing Cross, and the pace was not exhilarating. What the tube railway has done in that direction, the motor-bus is now doing in many others. Mr. Harper's book is illustrated with a plentitude of photographs, is published by Messrs. Chapman and Hall, Ltd., and will be of interest to many of our readers.

Sunday Motoring.

ONE of the most strange suggestions we have lately heard with regard to the restriction of motorists is that they should be prohibited from travelling during church hours on Sundays. "In some places," says a Whitby journal, "quiet worship is impossible by reason of the noise of motor-cars, and the sooner the Government puts a stop to the practice, except in the case of doctors, the better." This is about as silly as the trapping of drivers on unfrequented country roads. In many places notices are now shown indicating the proximity of a church, and the motorists going by are generally careful to avoid the blowing of their horns. This is surely all that can be expected, and the only effect of such a suggestion will be to raise a smile.

Touring in Spain and France.—Two Daimler Cars near San Sebastian. The front vehicle is in Spain and the rear one in France, a post on the left side of the bridge indicating the frontier boundary.

Proposals for Speed Limits.

APPLICATIONS for speed limits are coming along, and from Kendal in the north to Egham and Chertsey in the south local authorities are considering applications to the Local Government Board. The places named have gone further; they have decided to request their County Councils to take the necessary steps to secure the official restrictions. If this sort of thing is successful some of the anti-motorists may be emboldened into a plea for prohibition. These pin-pricks from various parts of the country are not only harassing the amateur, they are thwarting the activity of the trade.

Accuracy in Taximeters.

Now that the taximeter is being recognised as an essential part of the equipment of the motor-cab, we would lay stress on the necessity of perfect accuracy being ensured in its use, otherwise it will become a snare for the unwary and a dishonest harvest for the cabby who has acquired anything of the nature of the old-time driver of the horsed vehicle. Several cases have been before the courts where doubts arose which were not dispelled even by expert evidence. Our own experience has confirmed the uncertainty that is felt by frequent use of the taximeter-cab, and altogether there is, at

present, a dubious feeling with regard to the device that calls for the serious attention of all concerned in the development of the new form of traffic. Electric meters have to undergo official test, gas-meters are similarly subject to authoritative survey, and the cash registers are equally well overhauled and officially attested as correct. To tamper with any of these things is a criminal offence leading to the police court and branding the offender as one of the wicked. We would urge that the same stringent methods should be applied to the taximeter; that they should be subject to official examination and verification, and that anyone found robbing the public by tampering with the mechanism should be liable to all the pains and penalties visited upon those who prefer gas or electricity. Otherwise the last stage of those who patronise the London cabby will be worse than the first.

Carriage Builders and Motor Cars.

AT the twentieth autumnal meeting of British Carriage Manufacturers, which opened at Chester on Tuesday, Lieut.-Colonel Mulliner, of Northampton, in his presidential address, referred to the immense growth of the motor industry. He said there was a diminution in the number of bodies purchased either in the raw or finished state from the Continent, British manufacturers of motor chassis having evidently recognised the fact that the carriage-building done in this country for automobiles was as good, if not better, in design and finish as the best Continental work. Sir William Angus, who followed, said he firmly believed there would be a revival in the coach-building trade, as he thought the motor-car was not at present fulfilling its real mission. Ladies did not live for the sole purpose of rushing through the air at fifty miles an hour. That novelty would soon wear off. There was not a more beautiful object in the world than a well-dressed woman in a carriage. Ladies would not go about for ever disguised as ghosts. Even a respectable horse that was not afraid of a motor-car was frightened by the goggles which looked out of it! This phase would pass away, for while the automobile would remain the most convenient carriage for getting into the town or for covering long distances, it could not equal the pleasure carriage for taking the air and meeting friends.

A Dubious Point.

IN our issue of the 31st ult. we referred to an interesting point that had arisen at Dunbar, where a prosecution arose in connection with a trap laid, it was alleged, over a portion of a road where a ten-mile speed limit was in operation. The Scottish A.C. have had under consideration the decision of the sheriff of Haddingtonshire in convicting the driver of a member of the Club for exceeding a speed limit of ten miles an hour in Westbarns over a portion of road which is partly within the county and partly within the burgh of Dunbar. The objection was urged at the hearing that the application upon which the speed limit was fixed was made by the County Council of Haddington, who have no jurisdiction over the roads within the burgh, that the notice boards have been improperly erected, and that consequently the speed limit cannot be applied to that portion of the road under the burgh's control. It has been agreed that, if an appeal be taken to the High Court, the Club will lend support to the same.

Educating Councillors.

AT a meeting of the Lower Ward District Committee of the Lanarkshire County Council, held in Glasgow recently, a recommendation of the District Highways Committee was submitted to the effect that application should be made to the Secretary for Scotland for the imposition of a ten mile speed limit in the villages and populous places throughout the lower ward of the county. On the motion of Mr. John Adam, of Larchgrove, it was agreed to delay consideration of the matter

for a month, and Mr. Adam undertook that during that time he would arrange that motor-cars should be placed at the disposal of the members of the Council in order that they might be driven over the roads in question and be in a better position, after the experience thus gained, to discuss the matter at a future meeting. A number of the members of the Scottish Automobile Club are lending their cars fitted with speedometers for this purpose—a means of practical education that recalls the strenuous work of the English Club in the old days of Whitehall Court.

Water on the Road.

THROUGHOUT the country experiments have been, and are, in progress with regard to the alleviation of the dust nuisance. That is not the only inconvenience to which motorists, in common with other users of the road, are subjected. High hedges, twisty corners, and other peculiarities of

Motor-car Imports and Exports.

THAT the 1907 season is rapidly drawing to a close is indicated in the returns relating to the importation of foreign motor-cars and parts into the United Kingdom during August. The number of complete vehicles which reached this country last month was 342, their value being given as £166,863. Parts were responsible for an additional £231,884, which gives a total of £398,747, as against £398,110 in the corresponding month of last year. For the first eight months of the current year the figures are:—Number of cars imported, 3,552; value of same, £1,531,389; imports of motor parts, £1,802,046; total, £3,333,435. For the similar period of 1906 they were:—4,413 cars of a value of £1,823,087; parts, £1,301,918; total, £3,125,005. Turning to the exports of British motor-cars and parts, these continue to show a steady expansion. The number of vehicles shipped during the eight months ending with August last was 1,259, of a value of £476,205; to this have to be added

Touring in Italy.—Crossing the famous Col di Tenda, which is at an altitude of 8,140 ft. above sea level.

[Allgemeine Automobil Zeitung.]

our English highways, are now being considered, and the motor-car is revealing the necessity for many improvements that were previously not very urgent. The experience of Mid-Sussex may be regarded as typical of many another place. At Pookbourne Lane, Hurst, increased traffic is showing the necessity to bridge a stream which crosses the road. In the days of long ago a stream across a road was a rural feature of not much importance if it could be comfortably forded by the pedestrian, but when motors or modern carriages have to encounter a stream, sometimes three feet deep, there arises a demand for improvement. The Pookbourne Lane improvement has been deferred in the hope that some of the motoring community may contribute to the cost. This is not the only water splash in the home counties, and the matter is important enough to warrant serious consideration on the part of some of the organisations that are endeavouring to make the roads passable to motorists.

parts estimated at £323,071, which gives a combined total of £799,276, as contrasted with only £420,760 in the corresponding period of 1906.

A YOKOHAMA correspondent writes that the number of motor-cars at present in use in Japan is very small, there being probably not more than twelve, owned, with one or two exceptions, by foreigners in the vicinity of that city and Tokyo, where one would expect to find them numerous. Few are up to date, and several could be classed "freaks."

CARBURATION, LTD., of Byron House, Fleet Street, London, E.C., who, a few months ago, brought out a patent carburettor controller and fuel economiser, which has attracted much notice, are now introducing a new design of carburettor in which the Gillett-Lehmann system is incorporated, together with other novel features, to which we hope to refer in a subsequent issue.

OXYGEN AND ITS USE IN PETROL MOTORS.

WHATEVER may be the opinion regarding the use of oxygen in the races at Brooklands, there can be no dispute as to the universal desire to promote the general efficiency of the internal combustion motor itself. Experiments are constantly in progress with fuels of various kinds, which almost invariably have for their composition a hydro-carbon base. It may not be out of place to refer here to the chemical action which occurs in the engine, by which mechanical energy is produced from the heat energy, obtained by the combustion of the mixed gases. Briefly, it is this: The gases themselves, produced in the well-known process of carburation, are first compressed, and then, by the electric spark or otherwise, ignited, with the evolution of tremendous heat and pressure. The heat naturally arises from the chemical union of the mechanically mixed gases, and the rise in temperature which accompanies the combination during oxidation increases the pressure by tending to expand the volume of the gases.

heat. In other words, the thermal efficiency of the latter combination is far higher than that of the former. Further, when an oxy-hydrogen mixture is exploded and water is produced, and water only, as the product of combustion, the general efficiency of the engine is necessarily higher. The water which is produced tends to lower the excessive temperature to which the cylinder walls otherwise rise. This, while theoretically a loss of thermal efficiency, is a gain in mechanical efficiency, as an undue rise in the temperature of the cylinder walls neutralises its tendency to conserve the ultimate thermal efficiency by limiting, by immediate rarefaction of the gases, the supply necessary to maintain it. From this it follows that the most perfect form of fuel possible would be an oxy-hydrogen mixture, as this would eliminate the inert nitrogen entirely from the equation, and would substitute throughout a complete combustion of fuel with the highest heat value, for the partial combustion of one of lower efficiency.

This perfect fuel, however, has not yet arrived, but with the rapid march of progress in chemical science it may not be long before it does. In the meanwhile we are confronted with the

The Hertfordshire Club's Hill Climb at Aston Hill.—Mr. H. S. Adey's 14-h p. Germain Car making the Ascent.

When a hydrocarbon, like petrol, paraffin, or benzene, is used, the chemical process is essentially the oxidation of the carbon with a portion of the oxygen of the air to form carbon dioxide; another portion of the oxygen also uniting with a volume of the hydrogen to produce water. Now, in addition to this change, there is a mechanical process going on which is actually and entirely a loss of energy. The air, from which the vital element oxygen is obtained, contains three parts or thereabouts by volume of nitrogen, an inert gas which acts merely as a diluent, being swept into and out of the cylinder without taking any active part in the chemical processes. It forms (the nitrogen) a considerable part of the exhaust gases, the balance of which are the uncombined or unconsumed hydrocarbon mixture—evident by its characteristic odour—and the carbon dioxide of the combustive process, to which must also be added the partly vapourised heavy hydrocarbon lubricant.

When oxygen unites with carbon to form carbon dioxide there is an evolution of much heat; but when oxygen unites with hydrogen to form water, there is a far greater evolution of

problem of getting the best results from the fuel we use ordinarily. Here, in the use of additional oxygen, we see the endeavour to increase the thermal efficiency by supplying in sufficiently great volume the necessary oxygen to ensure as nearly as possible complete combustion of the fuel used. Given an inexpensive method of producing liquid oxygen and liquid hydrogen, with a convenient means of storing them on the car, together with a simple apparatus for permitting their re-vaporisation and mixture, we shall have made a distinct advance towards the perfecting of an already excellent mechanical invention. The increased thermal efficiency would have a distinct bearing upon the experimental side of the science of aeronautics, in which, even in these days of extremely high efficiencies per pound weight of engine, there must be greater reductions to assist in the production of the mechanical bird. J. W. F.

MR. S. J. BULL has retired from the management of the Waterloo Motor Works, which will be carried on under the supervision of the Hon. Lyndhurst Bruce.

Under Cader Idris and Snowdon to Chester.

BY JOHN LL. WARDEN PAGE.

(Concluded from page 595.)

THE way out of Llandudno takes us along the wide esplanade and over the neck of the Little Orme, and the road is steep and winding. On the other side lies the watering place of Colwyn Bay—in fact, along this coast there is a procession of watering places. However, we do not see much of them, for ere long we turn inland for St. Asaph. Climbing out of Colwyn Bay we run downhill through the pretty village of Llandulas and past Gwrych Castle, where Lord Dundonald lives, a place beautifully situated at the base of wooded crags, and turn through the little town of Abergele towards the Cathedral city. The best of the scenery is now behind. The mountains are things of the past. Still the country is anything but tame, especially about the Vale of Clwyd, where St. Asaph nods drowsily. As we approach it we pass Bodelwyddan church, the spire of which has been a prominent object for miles. This, one of the most costly village churches in

The River Dee at Chester.

Bodfari and thence to Mold, over the slopes of the bold range that bounds the Vale of Clwyd on the east. The pyramidal mass on the summit of the loftiest, Moel Fammau, represents the ruins of a monument set up to mark the Jubilee of King George the third of pious memory. Mold has a fine church which was once steeple-less—a fact commemorated in the old rhyme:—

Pretty Mold, proud people,
Handsome church without a
steeple,
though what cause the inhabitants
had for pride we know not.
Close to the town, marked by an
obelisk, is the field of Maes-y-

Garmon, the traditional site of the great battle of Alleluia, where in A.D. 448 an army of Christians, led by Germanus (hence Garmon) and Lupus utterly routed an immense host of Picts and Scots, and in the other direction is Tower, an old mansion which takes its name from an embattled tower, centuries older than the house. This place has a grim history. In the Wars of

Castle Street, Conway.

the country, is well worth seeing. It cost £60,000 and is (as it well may be) a marvel of costly stone, sculpture and carving. St. Asaph is hardly more than a village, and the Cathedral, the smallest in England or Wales, has little of interest about it.

The last thirty miles, from St. Asaph to Chester, are soon disposed of. The road turning south crosses the Clwyd and ascends gradually through a picturesque country to the village of

the Roses the tower was the abode of one Reinallt ap Gryffydd ap Bleddyn, a Welsh chieftain always at feud with the citizens of Chester. Matters culminated in his seizing the mayor, carrying him to Tower and there hanging him. This could not be tolerated. The citizens attacked the keep in such force that Master Reinallt, thinking discretion the better part of valour, retired and hid himself close by. The infuriated citizens rushed

headlong into the house. Then Reinallt emerged from concealment, turned the key in the door, and set the place on fire! Few, if any, returned to Chester, for those who escaped the fire this truculent Taffy put to the sword. Those were pleasant times.

The country about Mold is not improved by the presence of collieries and other blots of commerce. Neither are the roads, which in places are loose. Still there is not much to grumble at. At the village of Broughton many motorists will diverge a mile or two to visit Hawarden Castle, where Mr. Gladstone lived and died. There are really two castles at Hawarden—an ancient and a modern. Of the former little but an ivy-mantled keep remains. It came into the hands of the Glynnnes (Mrs. Gladstone was of this family) in the time of the Civil Wars, when Sergeant Glynnne, a friend of Cromwell, bought it after its assault and capture by General Mytton—the same amiable gentleman who threw the Irish defenders of Conway into the river tied back to back.

Hawarden Castle is the last place of interest in Wales. At Saltney we cross the boundary of Flintshire and are in England. And the beginnings of England are not good. The road is bumpy and there are tramlines which accompany us the last two miles into Chester. But if the approach thereto is indifferent, Chester,

SOME USEFUL NOTES.

THE fact that a sparking plug will spark outside the cylinder is no guarantee that it will discharge properly when under compression in the cylinder, as the added resistance of the air gap between the spark points, caused by the gas pressure when the engine is compressing, is often enough to cause the discharge to pass by preference, through defects in the insulation, which are, however, not serious enough to manifest themselves when the spark has an easy path between the points.

THERE is a curious belief, which is very widely current, in regard to cleaning sparking plugs when they have become fouled. One often sees the most minute care being exercised to carefully brighten the metal of the points, while, at the same time, the condition of the insulating surface between the central electrode and the shell of the plug is ignored. As a matter of fact the presence of soot or carbon on the points is of no account whatever, unless there be enough to form a conducting bridge between the live and the earthed electrode. The matter that really demands attention is whether there is a layer of carbon on the surfaces of the insulation over which the current

The above illustration depicts the two Motor Road Trains with which some Trials have recently been carried out by the Austrian Military Authorities. *[Allgemeine Automobil Zeitung.]*

it must be admitted, makes a good *finale* to our tour, and I am sorry that an account of its "rows," its walls, its Cathedral can find no place here. As the bricklayer said when he finished his day's work, "That is another story."

THE latest addition to the ranks of British motor-car builders is Messrs. H. Coltman and Sons, of the Midland Iron-works, Loughborough, an old-established firm of engineers. We have been aware for some time that Messrs. Coltman have been at work on the production of a car, to the designs, and under the supervision of Mr. Wm. Wilson, and we are now able to announce that the first car is on the road undergoing its initial trials. The vehicle is fitted with a 20-h.p. four-cylinder engine, in which a number of special features are incorporated, notably in regard to the ease of accessibility of the valves and the cam shafts, and also the dual ignition, which is effected through one switch and a single set of plugs. The transmission is through a cardan shaft and bevel gear, the latter being so arranged that the large bevel wheel and the differential can readily be taken out without removing the road wheels. We understand that, with a test body, the new car—with which we hope to deal more fully in a subsequent issue—has already been driven close on 2,000 miles, and has fully answered the expectations of the makers.

can find a path and along which it can short circuit. It is the insulation that needs cleaning rather than the points, and the plug may have to be taken apart to allow this to be properly done.

If a good spark is obtained at the plugs, it can safely be presumed that the electrical system is working correctly. If a good spark is not obtained, the following may locate the trouble:—First, the accumulators may be run down. Test them with a voltmeter—they should show at least four volts. Second, a loose connection at some point in the electrical system. Go over all connections, and make sure that all the terminals are perfectly tight. Third, broken wire, either in the wiring or in the coil. If the trembler of the coil works properly, the trouble is not in the latter. Fourth, a loose connection or a short circuit in the contact maker caused by dampness, weak springs, or the plugs being loose or worn. An examination at each of these should show where the difficulty lies.

A LARGE excess of oil in a certain cylinder is likely to cause a more extensive and rapid deposit of carbon on its piston head than will accumulate upon the others. Sooner or later, especially when doing hard work, this cylinder is almost sure to develop pre-ignition, and bad "knocking" will be the result. The scraping off of the offending carbon crust is the obvious remedy.

SOME HINTS REGARDING LOW-TENSION MAGNETO IGNITION.

AT different times various accounts have been given of troubles in connection with magneto ignition; as this form is increasing in popularity, a few hints on the adjustment and operation of the rotary type of low-tension magneto may be of interest and utility to many motorists. In the first place reference may be made to the accompanying sketches, Figs. 1 and 2, of the make and break mechanism which forms a necessary adjunct to the low-tension system, and which we have prepared with the view of enabling the following remarks to be readily comprehended. A is the ignition cam; B the cam lever; C the adjustable spindle for timing; D the striking lever; E, the ignition plug lever; F the contact lever; G the tension spring for the contact lever; H the tension spring for the cam lever; and P the ignition plug.

On several occasions we have seen motorists on the road, owing to their engine, from one cause or another, refusing to run, taking these parts of the ignition system down, whereas they should never require touching except in a workshop. The part which goes wrong in nine cases out of ten is either the contact lever F or the ignition plug P, which wears slightly owing to the continual tapping and the excessive heat at the point of contact. When these contact points have worn so as to reduce the space X to a minimum, a short circuit is formed, the result of which is that it is impossible to get a spark in any of the cylinders. Therefore, when a petrol motor misses fire and stops

FIGS. 1 AND 2.

owing to ignition troubles, all that is necessary is to first see that the conductor wire from the magneto is in order; secondly, to see that the springs G and H are all right; and thirdly, to turn the crankshaft round until the striking lever D rises to its highest point, in order to see that there is a space between the levers D and E. This space should be about one-sixteenth of an inch in width on most motors; it may vary a little on some makes, but the right position can soon be ascertained. The

adjustment is made by loosening the nut which secures the ignition plug lever E, setting the lever in the desired position and securing it in place by the nut. The crankshaft should next be turned further round until the striking lever D falls sharply on the ignition plug lever E, thus breaking the contact between the contact lever F and the ignition plug P, a spark occurring at the same moment between these two points.

In the case of a four-cylinder engine, the timing of which is considered to be wrong, all that is necessary is to turn the crankshaft round until one of the striking levers D falls sharply

FIG. 3.

on the ignition plug lever E, and at this point put a chalk mark on the flywheel rim; repeat this with all four cylinders, and note that the chalk mark falls precisely on the same centre for cylinders No. 1 and 3, and directly opposite on the flywheel and on the same centre for cylinders No. 2 and 4. From Fig. 2 it will be noticed that the cam A has a gradual rise to the top and then a quick fall; the tension spring H pulls the cam lever against the cam, and is of sufficient strength to overcome the tension of the spring G. Thus, when the highest point gets past the lever B, the lever D then strikes E and breaks the contact between F and P, and at this instant of breaking the contact the spark occurs. If the cams are of the slow type, as shown by the dotted line, the method for fixing the timing is the same, except only that the flywheels should not be marked until the lever D just touches the lever E.

With regard to the magneto and the magnets becoming demagnetised, there are those who imagine this happens at very short periods. This is, however, not the case; we have already had a magneto running for over six years, and it is in perfectly good condition to-day, and has not yet been re-magnetised. The principal point about the magneto is to see that it is set correctly for the timing. Fig. 3 shows the armature in the correct position for firing when the ignition lever is set in its retarded position, and the line A indicates approximately the position of the armature when the ignition lever is fully advanced. When once the magneto has been set correctly (and this is usually done on the test bench) it should not be disturbed again, as it is then fixed to give the best possible working results. If, however, one has the idea that the full power is not being obtained from the magneto, all that is necessary is to detach the wire from the conductor rod or sparking plug and turn the motor, at the same time touching the base work of the magneto with the wire to see if a spark is obtained. If there is no current passing, the most likely thing to have happened is that some dirt has found its way between the spring contact points at the end of the armature spindle. It is a very good plan to wipe this occasionally with a piece of rag, and thus remove any grit that may get between these points.

The spring contacts on the end of the armature spindle

on some magnetos are quite unfit for use on motors, and they have been the cause of considerable trouble in the past. The contacts are too small and also too lightly made; and it might be well if manufacturers of these machines would look into this point and improve the design for conveying the current from the armature. A good piece of insulated wire should always be used between the magneto and the ignition plug or the conductor rod, and care should be taken that there are no loose strands which might cause a short circuit. By keeping these points in mind, more especially the contact at the end of the armature spindle on the magneto, and the space between the levers D and E, no serious trouble need be experienced with the low tension rotary-type magneto ignition system. One great feature about it is that very accurate firing is assured, which enable the very best possible results from the motor in regard to power to be obtained.

A SAFETY STARTING HANDLE.

A NEW safety starting handle for use in connection with petrol and heavy oil engines has lately been introduced by the Gas Motorenfabrik of Deutz, Cologne, Germany. The arrangement is such that, once the engine is in operation, or when it gives a back kick owing to too early ignition, the handle

is automatically thrown out of engagement ere it can inflict any injury to the operator's hands. Referring to the illustrations, it will be seen that the handle *a* is fixed by the nut *b* on the conical surface *c* of the spindle *d*. The rear end of the latter is so formed that it can, by pushing in the starting handle, be engaged with the pin *f* which passes through the prolongation of the engine crank shaft. *G* is a bracket from the motor in which the starting handle is supported. As soon as the engine starts up and its speed exceeds that at which the handle is being turned the pin *f* slides on the rear faces of the connection *e* and tends to automatically push it away out of engagement with the crank shaft.

Passing now to the means adopted to prevent a back kick of the engine—owing to the ignition being too far advanced—injuring the operator, it will be seen that the spindle *d* is surrounded by a bush *i*, which is free to slide in the hole *g* of the bracket *G*. In the rear end of the bush is mounted a free-wheel clutch, shown separately at 3, somewhat similar to those now used in bicycles. While the bush is normally quite free of the spindle *d*, it is rendered, by means of the clutch, solid therewith the moment the engine shows any tendency to give a back kick. When this occurs the pin *l*, which is fixed in the bush, and which, when the starting handle is placed in position, becomes engaged with a hook *m* (shown in the plan view No. 2) formed on the top of the bracket, slides on the inclined face of the hook, and so pushes the handle out of engagement.

MOTOR AUCTION SALES

THE motor-car has not only altered the aspect of the streets; it has transformed the outlook of the shops that line the same, and scarcely an important thoroughfare in the west end of London fails to bear witness to the progressive development of the automobile industry. Long Acre's transformation has become a hackneyed suggestion of the change; Piccadilly and the more aristocratic roads and streets going westward tell the same tale. A little to the north, in the region of which Euston Road is the centre, has no variant in the general confirmation of the strength of the motor-car trade. It has ousted older businesses to the rear, and now asserts itself as a regular and recognised business of the country. This is true of London; it is also equally certain with regard to the provinces, where, emulating the Metropolitan example, auction sales are now regarded as mutually helpful in the way of business.

But with regard to Euston Road, the Motor House, or rather the two Motor Houses, of which Grand Maison d'Automobile, Ltd., are the proprietors, occupies an unique position. To visit the establishment nearest the Tottenham Court Road is an education in the art of liberal decoration, for the showrooms seem to typify the high-class range of the stock, including not only the utilitarian touring car for the professional man, whose enjoyment of the pastime is limited to the week-end, but the lordly vehicle for a duke or the speedy car for the Brooklands racing track. Here, as a matter of fact, is a permanent exhibition of cars for all classes of private owners.

Then there are the auction sales, that take place every Thursday, attracting buyers from the provinces—both private and trade—as well as regular visitors from the London area. The auction sales have developed well, and many an owner who realises the limitations of his small car sends it to the Motor House, where it is generally disposed of at a price that is reasonable—to those who buy and those who sell. Hence there are always gentlemen on the look-out for reliable vehicles of a type not too antiquated, and who go to Euston Road in the confidence of being able to supply their wants. It follows, therefore, that the auction sales of the Motor House are always full of interest—of a really practical kind.

The other day we looked in at one of these non-reserve sales. Cars of every type were among the lots catalogued for sale—Lanchesters, Darracqs, Panhards, Wolseleys, M.M.C.'s, Gladiators, Peugeots, Napiers, and, in fact, all the best-known cars of British or foreign origin, find their way to the Motor House. The auctioneer asks for a bid, just by way of a start, and a timorous call of £50 or £60 comes from the tonneau of one of the cars, in which the prospective purchasers sit while the miscellaneous assortment of parts, spares and accessories is being offered. Then by easy stages the biddings advance; the auctioneer dwells on the advantage of the canopy in wet weather, the detachable body in dry, and the general features of the particular car that distinguish it beyond all others. Meanwhile the busy buyers assiduously watch for opportunities, and thus the afternoon passes away, scores of cars changing hands, and many men coming from the sale-room actual motorists who previously did not own a car.

To assist users and drivers of Napier six-cylinder vehicles, Messrs. S. F. Edge, Ltd., have drawn up a diagram which enables the driver to make quite certain that he is not missing any point when lubricating his car. As every detail which requires attention before a day's run is numbered, he can walk round his car and count each grease cup as he turns it, and so be quite certain that he has not missed one; and the same applies to the points which require oiling. A copy of the diagram is being given to every owner of a Napier, mounted on stiff cardboard, and arranged to hang up in the garage, so that it should be of great assistance in helping the chauffeurs to keep their cars in perfect running order.

THE British Motor Body Company, Ltd., have large premises at Bannermill Works, Aberdeen, where they are doing much in motor-carriage work.

MOTORING has been taken up with great enthusiasm by the people of Argentina, and it is predicted that in the near future Buenos Ayres will be one of the leading cities of the world in the number of its automobiles.

The London and North-Western Railway Company have recently built a large slope at the Camden Town Goods Station to enable them to deal promptly with the motor-cars they carry to London. The photo reproduced above shows a group of Argylls just arrived for Argylls London, Ltd.

A MOTOR gymkhana will be held in aid of the Ross-on-Wye Golf Club on Tuesday, the 17th inst. Mr. T. W. Coombes, of Ashfield, Ross, is the hon. sec. of the event.

A CORRESPONDENT writes that there are at present about seventy pleasure cars and some twenty to twenty-five motor-lorries in use in Singapore. These latter are used owing to their ability to negotiate the hills with fairly large loads.

A CORRESPONDENT of one of the daily journals suggests that those owners of motor-cars who lack passengers when travelling should take strangers aboard, "and so help to bridge over the gulf between motorists and the public, and also help to make country life a little more social."

A NEW cradle for carrying spare tyres on the car is being put on the market by Messrs. Wm. Cole and Sons, Ltd., of High Street, Kensington, W. The device, which can be detached from the car by undoing a single screw, is very simple, and is adapted to take any size of spare wheel, rim, or tyre.

UNDER the guidance of Mr. W. Shave, the works manager, we recently had an opportunity of going over the works of the Albany Manufacturing Company at Cumberland Park, Willesden Junction. The exterior of the premises gives but a faint idea of what must be one of the largest and most important works devoted to motor-car repairs in the country. At the time of our visit there were close upon 300 hands engaged in the different departments, prominent among which is that devoted to the manufacture and repair of radiators, where we saw many familiar patterns being dealt with. The buildings also include a foundry for the production of repair castings in iron and aluminium, a plating and polishing shop, wheelwright and body painting and repair works, machine tool department and a tool-making section. Perhaps the most striking of all was the dismantling and erecting shop, where there appeared to be collected the cars of every make and pattern. With an establishment of this description, with facilities for making any part of a motor vehicle, the Albany Manufacturing Company are able to carry out any class of repairs without having to wait an indefinite period for replacements from the maker, a feature of great advantage, especially in the summer months, when the loss of one's car for a few weeks is a consideration.

HERE AND THERE.

MR. W. BLAND, who has a garage in the Poulton Road, Southport, has been injured in a fire which broke out on a motor-car in that establishment.

IN connection with a bazaar in the Cambridge Hall, Southport, to-day (Saturday) a 14-h.p. Vulcan motor-car, now on view at the garage of Mr. Harold Bell in Tulketh Street, Southport, will be offered for sale by auction.

WE regret to learn that Mr. Rees Jeffreys, secretary of the Motor Union, has been ordered to take a month's rest and to undergo a course of treatment at Harrogate. He hopes, however, to be present at the Leicester meet to-day (Saturday.)

THE new bridge which has been constructed over the river Witham at Langrick will prove a boon to local users of the road. Hitherto the nearest bridge on the south was at Boston, five miles away, and on the north at Kirkstead, nine miles away.

MRS. PIERPONT MORGAN has just completed a successful tour through the north of England and Scotland on a 30-h.p. touring car, placed at her disposal by the Motor Supply Co., Ltd., of 111, Piccadilly, W. She was accompanied on the tour by Miss St. Clair, the daughter of Archdeacon St. Clair, and Miss Gregory.

THE United States exports of motor-cars have at last overtaken and passed the imports, which were so long in the lead. This is revealed by the figures just issued by the U.S. Bureau of Statistics of the Department of Commerce and Labour, for the fiscal year ending June, 1907, which show that the exports totalled £1,100,000, and the imports £900,000.

THE new list of the Stepney Wheel Company gives illustrations of the various patterns made for use in conjunction with artillery or cycle type motor-wheels, together with full instructions as to the fitting of the same. A new departure is seen in a new spare wheel specially adapted for cars having unequal size road wheels, and another pattern designed for use in connection with cars the wheels of which are shod with Collier mechanically-attached tyres. Several pages of testimonials from satisfied users of the Stepney form a fitting conclusion to the list.

WE illustrate herewith the special single landaulet body which has recently been completed by Mr. John C. Beadle,

carriage builder, Dartford, for a 24-h.p. De la Buire chassis to the order of Messrs. Rimmer and Co., of Great Portland Street, W. As will be seen, the feature of the body lies in its suspension on Cee springs, which renders it exceedingly comfortable riding and well adapted for town use. On completion the vehicle was subjected to a very severe test of 250 miles before being delivered, carrying five adults, and it was eminently satisfactory, scarcely any vibration at all being felt. We may add that the car in question has been acquired by Mr. Hugh Andrews, of Winchcombe, Gloucestershire.

MOTOR-CARS are let for hire by Messrs. J. W. Greenwood, Ltd., of Portland Place, Halifax.

A CHAIR of motoring will be established at the opening of the next term in Washington University, St. Louis, U.S.A.

MESSRS. FARR AND SON, proprietors of the Auckland Motor and Carriage Works, Bishop Auckland, are making a speciality of motor-car bodies.

MOTORISTS will be interested in hearing that it has been practically decided to engineer a new road between Lynmouth and Minehead, obviating the necessity of going up and down Countisbury and Porlock Hill.

A CORRESPONDENT writes and describes "a rocky-faced and jowl-cheeked individual," somewhere from "down-under," who was on the Brighton road last Saturday—car, a Daimler, cream-coloured, sign "L.N. 5865—blocking the road and preventing other cars passing. We regret we cannot publish further of the communication.

THE Slough Urban District Council have decided to ask the Bucks County Council to apply to the Local Government Board for a speed limit of ten miles an hour for motor-cars passing through Slough. They have further resolved to draw the attention of the County Council to the damage done to the roads by the steel-studded bands on motor-car wheels.

MESSRS. J. AND R. OLDFIELD, Warwick Street, Birmingham, are now fitting a driving mirror to their side lamps, both electric and paraffin, at a small extra cost, an arrangement which should prove very useful to motorists on the road, and especially

so in crowded thoroughfares. Mirrors are now looked upon by many automobilists as a necessary accessory to a car's equipment, and Messrs. Oldfield's device is, we understand, meeting with a rapid adoption.

DURING the Scottish Reliability Trials in June last, Mr. E. J. Mitchell, of the Palmer Tyres, Ltd., traversed the same route as the competing cars on his 18-h.p. Siddeley car, fitted with 6 in. Palmer tyres, which attracted considerable attention. These have now covered a distance of over 5,000 miles, and on examination the other day we found that beyond a slight wearing down of the rimmed corrugations the tyre was perfectly free from cuts and dentations.

DESPITE the deadness of the season, no fewer than 243 new members were elected at the fortnightly meeting of the Executive Committee of the Automobile Association on Tuesday last, among them being the Duchess of Beaufort, the Duke of Abercorn, the Earl of Dalketh, the Earl of Abingdon, the Earl of Macclesfield, Sir William Cooper, Lord Forester, Lady Gordon Lennox, Lord Gerald Grosvenor, Sir Henry Kimber, Lady Henrietta Guinness, and Sir Alfred Cooper.

OWING to the fact that cars are now being built of such large dimensions, difficulties have been caused in loading up on some lines when cars have been sent by rail. The Midland Railway Company has accordingly had some special covered trucks made, suitable for this traffic, and possessing the following dimensions:—Height at side, 7 ft. 1½ in.; height in centre (inside), 9 ft. These trucks will take a car measuring 7 ft. 5 in. in width, and in addition other trucks have been made measuring 31 ft. in length, and capable of carrying two cars. When these special trucks are required it is, of course, advisable to give notice to the company a day or two in advance.

WE understand that considerable improvement has recently been effected in the Elastes filling for pneumatic tyres.

DURING this month the Aldershot command will engage in military manoeuvres, and motor-cars will again be extensively used during the operations.

MR. R. NICHOLSON, of Morpeth, has written to the Local Government Board suggesting that local authorities should be encouraged to provide suitable housing accommodation for the men whose duty it is to keep rural roads in order.

IN connection with the note in our last issue with regard to troublesome tail lamps the "Signal" Motor Company, of 85, Sisters Avenue, Clapham Common, S.W., draws our attention to the "Signal" tell-tale, which operates by thermostatic action, and consists of an electrical contact opened by the heat of the lamp flame. Immediately the lamp becomes extinguished this contact closes and illuminates a small electric lamp fixed on the dashboard, and warns the driver that his tail lamp is out.

ON Tuesday last Mr. S. F. Edge entertained Mr. Charles J. Glidden to lunch at the Café Royal, London, W., in order to enable him to meet a number of prominent motorists, and to relate to them some of his experiences whilst twice encircling the globe by motor-car. In proposing the health of the guest, Mr. Edge said that it was five years since Mr. Glidden purchased a 24-h.p. Napier, on which he had now driven a distance of 42,367 miles in thirty-five countries in 337 days of running, having crossed the Arctic circle in Sweden, and created the record which he still holds for "farthest north" on a motor-car as well as reaching the most southerly road in the world in New Zealand. It seemed to him that the secret of successful touring had been found by Mr. Glidden in his system of never pushing a car overmuch. For instance, if he intended to run for ten hours during any day he was content to cover 150 miles in that time. Without question, going steadily was the whole secret of touring great distances at a minimum of expenditure. Mr. Glidden, in responding, said that he had found ample leisure during his travels to take over 2,000 photographs and to write over 200,000 words concerning his experiences. Since using his old British-built petrol car he had travelled through 11,000 cities, towns, and settlements. The rest of his tour, which he hoped to complete in 1911, would be chiefly among the countries around the Mediterranean and in the Southern American States.

THE preliminary open-air trials of the first military dirigible balloon to be built in England were carried out on Farnborough Common on Tuesday last with satisfactory results. It was towed out from its shed by a detachment of about fifty men of the Balloon Companies of the Royal Engineers, under the direction of Colonel J. E. Capper, R.E., superintendent of the balloon factory. The balloon is of the shape of a huge sausage; it is about 90 ft. long and is covered from end to end with a fine network of cordage, which meets about 10 ft. below, where it is fixed to a light steel framework. Below this again is a boat-shaped car of light steel framework covered with canvas. An eight-cylinder provides the motive power, it being connected to propellers fixed on either side. Mr. F. S. Cody, who has been attached to the Balloon Department for experimental purposes, was in charge of the engines; Colonel Capper steered, and Captain King, of the Balloon Department, completed the crew. The lifting power of the balloon was first tested, and this was found satisfactory. The engine was next tried, and the balloon, ballasted so that the keel was just a few feet off the ground, was propelled along at a good pace by means of the fan-like propellers. The surplus ballast was then removed, and the Sappers being ordered to let go the trail ropes, the balloon rose quickly up over the common to about a thousand feet, with its head to the wind. The engine was put in motion, and the airship started, and at once moved forward against the wind, rising and descending as the wings at the sides were altered. The steering apparatus was afterwards brought into play, and three parts of a circle was made, the arc described being about a mile and a half in extent. A defect in the engine water circulation necessitated a descent, but, this having been put right, the airship was again tested in the afternoon, completing a circle of about three miles, and again descended near Jersey Brow. It was then replaced in the shed to await further trials.

CONTINENTAL NOTES.

Motoring in the Paris District.

The Touring Committee of the French Automobile Club in a recent circular once more calls the attention of motorists to the fact that a special service exists on the club premises for the purpose of measuring-up petrol tanks on motor-cars, and that owners will save themselves considerable annoyance at the Octroi gates on entering and leaving Paris if they can present tanks measured in this way. It is not necessary to be a member of the A.C.F. to take advantage of these arrangements. Octroi officials everywhere now recognise the accuracy with which the measurement is carried out, and accept the certificate given by the club as to the capacity of any tank, no matter what the shape.

The French Rule of the Road and the Position of the Driver.

As is well known, the rule of the road in France is the reverse of that obtaining in Great Britain, vehicles being required to keep to the right and pass on the left. Notwithstanding this, the driver's seat and the steering wheel and control gear of motor-cars are arranged on the right, the same as on British

minute inquiry in each case, and as far as possible obtain the evidence of witnesses on this point. If it is finally proved that the majority of accidents are due to fast or reckless driving very severe measures will be taken, and in addition to heavy fines the licences of motorists will be withdrawn.

Taxation of Motor-Cars in Austria.

The Lower Austrian Diet is considering a proposal to impose an annual tax of 1,000 kronen (£40) on motor-cars, and of from 100 to 200 kronen (£4 to £8) on motor-cycles. Advocates of the measure argue that the tax is rather in the nature of compensation for the dust nuisance and the damage wrought to the roads by the passage of motor-cars travelling at a high speed. Manufacturers, on the other hand, declare that so heavy a tax will spell ruin to their industry, as it will deter many would-be motorists from purchasing cars.

A New Car for the Kaiser.

The Kaiser has just added a Fiat six-cylinder car to his stud of automobiles. The vehicle, which was supplied through

The Brescia Race Meeting.—Minoia, the winner of the Coppa Florio, at the wheel of his Isotta-Fraschini.

machines. The result is that the driver of an automobile wishing to pass another vehicle does so at great risk, inasmuch as he is unable to see in crowded traffic whether there is a clear road ahead, or whether another carriage is approaching in the opposite direction. Furthermore he is badly placed to make a safe turn in the road, which must be to the left. In view of this M. Charron, of the C.G.V. firm, is urging, with some reason, a change in the construction of motor-cars for use in France to the extent that the driver's seat and steering wheel should be located on the left side, with the change-speed and hand brake levers arranged in the centre of the floorboard between the driver and the passenger.

Motor-car Accidents in France.

In view of the continued frequency of motor-car accidents, the French Ministry of the Interior has notified the authorities of the different Departments that more stringent measures must be taken in the future. The Prefecture of the Seine has, as a result, issued an order that whenever an accident occurs a special report is to be made as to the speed at which the car was going at the time of the collision. The police agents are to make a

E. E. C. Mathis, of Strassburg, is fitted with a side entrance double phaeton body, a wind screen and hood being furnished in connection with the rear seats.

Miscellaneous Items.

Forty-six entries have so far been received for the reliability trial of industrial motor-vehicles which is to be held in Germany in October.—A 28-h.p. Mors car was last week driven to the summit of Mont Revard, near Aix les Bains. The feat has attracted considerable attention in the neighbourhood, as no horse-drawn vehicle has so far been able to make the climb.—Seven entries have so far been received for the competitive trial of two-cycle petrol engines which is to be held in October by the French Automobile Club.—The French Post and Telegraph Office are about to invite tenders for the transport of the mails between Draguignan and Castellane, Lower Alps, by motor-vehicles.—The Swiss Automobile Club has recently issued an exhaustive Road Book; it contains town plans, road maps, distance records, a list of hotels and motor-car repairers, and notes concerning places of historical interest or of exceptional picturesqueness.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

WHAT SHALL WE DO WITH OUR BOYS?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is really getting somewhat monotonous to hear the same reply vouchsafed from about 90 per cent. of the rising male generation when they are asked as to what they intend to be when they grow up. With a unanimity that makes one wonder what is going to become of all the other trades and professions, the youth of to-day plump for the motor industry. The reason is not far to seek; for, putting on one side the money getting side of the question, there is no doubt that a combination of fascinations is presented to the youthful mind by a life in the works where motors are manufactured.

With one huge factory after another being built, and one gigantic company after another being floated, the motor trade certainly looms large on the horizon, and it is no wonder that parents feel relieved at finding their sons choosing of their own accord a calling with such apparently rosy possibilities. But, whilst admitting to the full the enormous field that is opening up, and without any wish to proffer advice of the wet blanket description, I believe that parents will do well to study the question a little carefully before concluding that a royal road to fortune is offered to their progeny by the advent of the automobile.

Because there is always room at the top, and since it is a common falling with fathers and mothers to mistake mediocre intelligence in

Across Africa by Motor-Car.—Lieut. Graetz at Dar-es-Salaam, German East Africa, ready to start on his Gaggenuar Car.

their own offspring for transcendental genius, it is in many cases hard for them to think otherwise than that, however overcrowded the ranks may be, their Jock will inevitably squeeze through the ruck.

But what I feel called upon to point out is, that it is a pity that many a good business or profession, built up by years of unremitting toil by a father, and which he has fondly hoped will be continued by his son, should have to fall into strangers' hands or perhaps be buried altogether, simply because that young man is crazy to sit behind the steering wheel of a motor-car.

And again, unless one has influence, really good positions in the motor industry will soon be quite as hard to get by honest merit as in any other branch of engineering, perhaps more so. The days of crude experiments are over, and with settled designs and methods of working, a much larger field of labour supply is open for employers to choose from; in fact, were it not for this, half the factories would be short of competent hands. Companies once established replenish their staff as required with wondrous ease; all the officials, from the managing director down to the foremen, have friends and relations waiting for berths, and, therefore, it is only to be expected outsiders must take their turn.

With everybody rushing helter-skelter into the motor line there will be necessarily somewhat of a vacuum in those branches of industry which have or will become more or less neglected for it, and therefore it may be well for the more perspicacious to pause and look around for possible careers, whose future, for the reasons we have stated, promise a field with less competition and at least equal pecuniary advantages.—Yours truly,

WORKS MANAGER,

THE CONTROL OF THE ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With indescribable astonishment I read in your issue of September 7th the letter concerning control of the roads, signed by Mr. John Wallace, written, from the manner in which he has handled the matter, either in utter ignorance or ignorance feigned in order to better give currency to statements intended to be of detriment to the interests of the Automobile Association.

To commence with, your correspondent is entirely misinformed as to facts. The Automobile Association has taken part in no run this year, and the particular event referred to was that of the Motor Club, whose choice of roads brought them into close contact with Sergeant Wag-horne, the smartest man in the force, personally responsible for the vigilance exercised by the police on the Brighton road, who, owing to the run having been so extensively advertised, was very much on the *qui vive*, dividing his attention, by means of circuitous routes across fields, between his various measured stretches without our scouts being aware of the fact. Thus it was that that excellent sportsman, Mr. Cordingley, became the first and only victim; the other two cars which were stopped, a six-cylinder Napier (not driven by Mr. Edge, but a private owner), and a Fiat, preferring to continue their neck-and-neck race regardless of consequences, than to slacken speed at the warning which was given by the scouts.

The Automobile Association was instituted by a few sporting motorists with a view to making roads possible to all. But for its intervention, I dare not contemplate what the Brighton, Portsmouth and other main roads would be to-day, and, in my opinion, the highest tribute possible is paid to its organisation in the fact that out of 753 cars registered in the books of the scouts as using the Brighton road on the day in question, only one was trapped. Its popularity is widespread, and as an instance of this I would inform your correspondent that one noble lord recently forwarded a cheque for 10 gs. beyond his annual subscription, in recognition of the association's services in enabling him to now freely use one of the main roads leading from London, hitherto debarred him, without being pestered by the police.

—Yours truly,

WALTER GIBBONS.

THE 1908 A.C.F. GRAND PRIX RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. H. J. Chapman's letter in your issue of August 31st, I trust he will take no offence when I tell him that it has been a rarity with me to come across anyone who does not believe himself capable of driving a racing car with success in the classical races held on the Continent. He will probably be surprised to hear that when I first announced that I would make and enter Weigel cars in the Grand Prix and Ardennes races I had upwards of 200 letters from various people unknown to me, assuring me that they were without doubt the finest drivers in the world. If, however, I can be of any utility to your correspondent, and he is desirous of becoming famous as a racing man, I should advise him to get employment in a firm who build racing cars, and do his best to so obtain the appreciation of his employer as to get into the testing department, from which he will ultimately become an expert in all those branches which are required to make a good racing man.

If, however, he believes that he is the only capable driver, and that firms are losing by not employing him, he will never be successful. Most continental racing men have been recruited from the workshop, where they have proved their ability and reliability, and earned the confidence of the firm employing them. I trust your correspondent will take my letter in the spirit in which it is written, and I hope at some future date to welcome him as a successful racing debutant.—Yours truly,

D. M. WEIGEL.

FINDING OWNERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "Tourist," replying in your issue of the 7th inst. to my letter on the above subject, upholds the position of the County Councils and Local Government Board in refusing to give the name and address of a motor-car owner without reasonable cause assigned, and the payment of one shilling.

If "Tourist's" view be a correct one, it follows that it is not our business to trouble about inconsiderate and dangerous drivers whose exposure the authorities deliberately discourage. It is, moreover, absurd for County Councils to appeal to any motor union or association for assistance in checking, or for our journals to exhort their readers to expose the unknown and unknowable "motor-hog."

If it be the general desire of motorists that their names shall be a police and registration office secret, let us accept the consequence of our choice, and take gratefully the speed limits, traps and penalties

imposed upon us through the inconsiderateness of the few whom we are not supposed to be able to trace and influence!

"Tourist" prefers that the police should know him rather than that the public should, and seems to have less horror of summonses than of trade circulars and advertisements, and his view may or not be the popular one.

Personally I feel that, as road restrictions are multiplying so rapidly, it is time every facility and encouragement were given to motorists and the public generally to appeal directly, by letter or otherwise, to owners of cars who inadvertently, or through unscrupulous chauffeurs, are inviting the restrictions which we all deplore.—Yours truly,

D. W. SAMWAYS.

MOTORISTS AT KINGSTON.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Is it not now high time that motorists united together to boycott Kingston in the same way that Andover was boycotted some twelve months ago? Many motorists will remember how this latter town accumulated vast sums at its local police-court by trapping motorists. By uniting together and boycotting Andover completely, the tradesmen of this town soon raised such an outcry against their local police that at the present time motorists rarely appear at the Andover police-court, and then only when it is thoroughly deserved. Surely the action of the Kingston police has now reached such a pitch that the same treatment should be dealt out to Kingston by motorists as was dealt out in the case of Andover. Owing to the excellent work executed on the main roads south of London by the A.A. scouts the

not take chances, and she brings her car and its human freight home without damage. None of the accidents which the newspapers play up with inch long headlines occur when women are driving. Someone recalled this fact the other day when a number of experienced drivers were discussing the subject, and a veteran of the industry who was there remarked that not only was this true, but it had been his experience that the cars which he had sold for women to drive had been the subject of less repairing than those which were driven by men, particularly by professional chauffeurs. One reason for this, he thought, was that women did not try experiments with cars. When the cars were running well they usually let them alone. This, he thought, was an exceedingly desirable trait.—Yours truly,

J. W. HAYNES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The question exposes a point which does not receive due consideration; that point is individual natural adaptability. I have taught many people to drive, and I notice that while some can talk "motor" quite legibly for hours, others, who say little, can drive and manipulate their machines with a quiet, amateur determination showing excellent judgment and ability lying dormant and being called upon by the circumstances taking place during their tuition. Among those people, in my experience, the ladies are prominent; they take to it like ducks to the water, if they are naturally adapted to it, but if they are not then you cannot teach them.

I think a lady's delicate handling of a car is just as much envied by the men, as was their extremely graceful attitude of riding the cycle,

The Brescia Race Meeting.—The View at the Grand Stand.

police have been compelled, in order to secure a revenue for the Kingston borough, to direct their attention to several by-roads, where traffic is scarce. I, for one, have spent many hundred pounds in Kingston, but for the future shall spend my money elsewhere. If only all motorists who are in the habit of patronising Kingston for the week-ends and at other times would unite together and boycott this place completely, Inspector Marks and his confederates would soon be requested to direct their attentions elsewhere, or, at all events, to trap the dangerous and not the harmless motorist.

At the present time neither the police nor the magistrates of Kingston seem to make any distinction whatsoever between the careful and the inconsiderate driver. The Kingston police area covers Kingston, Surbiton, Walton, Esher, Cobham, and neighbourhood. A large number of motorists have already expressed their intention to join in this movement, but it is necessary that the boycott should be general in order to be successful.—Yours truly,

B. M. THORNTON.

SHOULD LADIES DRIVE MOTOR-CARS?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have observed that women who learn to drive cars are as a rule exceptionally capable after they have mastered the mechanical details of the work. It is true that they are not as daring as men in all emergencies. But this, to my mind, is rather a recommendation than a drawback. Most men take too many chances with cars. The desire to perpetrate the unusual seems to overcome them. Judgment may be good with them nine hundred and ninety-nine times, but the thousandth chance taken is apt to be their downfall. A woman does

when the machine for ladies came into vogue. I would much prefer, anyway, to be driven by a lady "artist" than by a man who "manages to get through."—Yours truly,

HERBERT J. CHAPMAN.

A CARBURETTOR TROUBLE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having purchased a new 14-16-h.p. car, I find there is a difficulty in the carburettor which the suppliers of the car cannot remedy, viz.—flooding after the vehicle has been stopped and wasting petrol through the air inlet pipe. If you can suggest a remedy I shall feel obliged. I may say that the suppliers of the car have fitted a piece of piping on to the air inlet and let the end up between the cylinders. This only receives the overflow and does not prevent the cause, as the end of the pipe joined to the inlet was not properly soldered, and of course allowed the petrol to escape.—Yours truly,

W. C.

[This trouble is in all probability caused by a badly adjusted level in the float chamber in relation to the amount of vacuum in the induction pipe when the engine is working. This results in the petrol in the float chamber rising to such a height to establish equilibrium that it is considerably higher than the top of the jet, and therefore each time the motor is stopped the surplus fluid runs out into the mixing chamber and so floods the inlet pipe. The difference in inertia between petrol and air is very great, and if the suction is too fierce round the jet nozzle in relation to the normal level, the stream of fluid will continue to spray out for an appreciable time after the throttle is shut. On the other hand, should the level be normally too low, there will be great trouble in starting.

If the carburettor is of the type with removable air cones it will be as well to try a larger one, provided that on careful testing the level of the petrol appear to be about 1 mm. lower than the top of the jet.

Carburettors with weighted needles are great offenders in flooding, as also are those with heavy floats.

The extra piece of inlet pipe that has been put on can only make matters worse, and if it had concealed the petrol, instead of, by bad soldering, allowing it to escape, it would have made it almost impossible to start the motor.

MOTERING FREEMASONRY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—An idea has occurred to me whereby the unhappy lot of a broken-down motorist might be considerably relieved. If an influential power such as yourselves would inaugurate a kind of Freemasonry and issue a neat sign that well-wishers to motorists would exhibit say in their gates or windows, such a sign would imply that the party would be willing to assist, in dire necessity, the person requesting help. How often has a motorist been prevented from continuing his journey for the want of a piece of wire, petrol, carbide, paraffin, accumulator or plug, which he is willing to pay for but cannot get? I have already dozens of people that would do it, and I should be glad to join. A list also could be published of those people who join.

I should be glad if you would publish this letter, and I trust such an union will be started, and thus forge another link in the chain of Freemasonry among motorists.—Yours truly,

FRED CATLING.

Mr. B. Johnson, of Messrs. S. F. Edge, Ltd., has just returned from Portugal, where an agency for Napier Cars has recently been arranged in the centre of Lisbon.

The photograph reproduced above shows the six-cylinder Napier he drove to the principal towns round Lisbon, at the castle which Mr. Hugo O'Neill built at Cascaes. Mr. O'Neill, who is a keen motorist, is aide-de-camp to H.M. the King of Portugal, and a direct descendant from the last King of Ireland.

LIGHTS ON HORSE DRAWN VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your note with regard to the necessity of lights being made compulsory on all vehicles is often demonstrated here in Cambridge. The other evening, while motoring just outside the town, I came upon a cart which was going in the same direction as myself. It had no light, either in front or at the rear, and had it not been for my powerful acetylene lamp I should most certainly have dashed into it. As it was I was as near it as I should ever want to be. Suddenly swerving I just managed to miss the cart, and had the road been at all greasy I should certainly have run into a ditch. We motorists are compelled to carry lamps. Why cannot the rule be universal?—Yours truly,

A NIGHT DRIVER.

TYRE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a heavy, high-powdered 9-h.p. tri-car, and have trouble with the back tyre bursting and throwing the machine over. Is there any kind of tyre or tube that would not go flat on puncturing or bursting? Elastes, I am afraid, would be too heavy. The tyre is 700 by 75 mm. and has a Grose non-skid fitted. I believe the studs of this get hot and cause the tyre to burst. Is there any way of filling the inner tube to prevent this happening?—Yours truly,

WILL BISHOP.

THE COMMERCIAL VEHICLE TRIALS.

THE Commercial Vehicle Trials promoted by the Royal Automobile Club are now in progress, the vehicles having started on their procession on Monday morning.

To inaugurate this important event a dinner was held at the Trocadero Restaurant on Saturday, at which Mr. C. D. Rose, M.P., presided. In the course of his speech Mr. Edward Manville, president of the Society of Motor Manufacturers and Traders, referred to this event as marking an epoch in the advance of the motor industry in this country. As a proof that all the competitors were serious in the matter, he mentioned that fifty-nine of the sixty machines entered had appeared for inspection, and that fifty-six of that number would actually start. Mr. W. Worby Beaumont said that the trials were the fruit of four years' planning, and Mr. J. D. Siddeley mentioned that manufacturers were looking to the trials to supply available data to designers or experience in the future. Other speakers made interesting comparisons with the trials of 1898 in Lancashire; 50 per cent. more vehicles were entered for those tests than for any others of like kind hitherto held, while half-a-dozen more makers were represented. Those trials cost £700, whereas the forthcoming trials will cost £4,000, towards which sum the Society of Motor Manufacturers and Traders have contributed 10 per cent.

Punctually at 7.30 on Monday morning the vehicles in Classes F and H got into line outside Messrs. Thornycroft's works, at Chiswick, for their journey to Reading. Of the ten entries, the two Fiat vehicles, which could not be got ready in time for the trials, did not start. An hour later the second class, D, was sent on its way; Class E was despatched in two batches at 9 and 10 o'clock respectively. The Siddeley brewers' dray had not put in an appearance at the depot owing to an accident whilst journeying to that place. The other non-starter was the Atkey-Gimson lorry, which had to retire owing to an accident to the gear-box, just as it was preparing to leave the depot. The last class to leave was A, the six vehicles in which had to traverse the longest route to Reading, namely seventy-one miles.

The run was uneventful, and absolute non-stop journeys were made by thirty-three of the competitors. Analysing the involuntary stops for mechanical troubles, we find that of six vehicles in Class A (10 cwt. loads) only two made non-stop runs; in Class B (20 cwt. loads) five out of six had a clean record; in Class C (30 cwt. loads) five out of seven; in Class D (two ton loads) three out of eight; in Class E (three ton loads) fourteen out of eighteen; in Class F (five ton loads) two out of eight, and the lorry with paraffin fuel only lost one minute; in Class H (five ton loads in trailers) two out of three. The vehicles making non-stop runs were, Class A, the 10-12-h.p. Darracq, the 10-12-h.p. Unic; Class B, the Straker-Squire (two), Lacro (two), and Palmer tyre Thames; Class C, Halley, Siddeley, Darracq-Serpollet, Dennis, Thornycroft; Class D, Straker-Squire, Milnes-Daimler, Churchill; Class E, Milnes-Daimler (two), Halford, Siddeley, Straker-Squire, Wolseley petrol-electric, De Dion-Bouton, Churchill, Maudslay, Dennis, Commercial Cars, Thames, Thornycroft, Ryknield; Class F, Milnes-Daimler, Dennis; Class H, Burrell, Foster.

On Tuesday the vehicles left Reading during the morning for Hungerford. Class A followed a route of seventy-two miles through Basingstoke, Winchester, Andover, and Bursage. Class B travelled through Stratley, Dorchester, Oxford, and Wantage, while classes F, G, and H went by the direct road through Purley, Thatcham, and Newbury, a distance of thirty miles. Chippenham was the stopping place on Wednesday and Bristol on Thursday, the cars being placed on exhibition on Friday at the Avonside Engine Works.

THE CANNING CUP.

AFTER providing sport for the members of the Motor Cycle Union of Ireland for a number of years, the Canning cup passed out of the possession of that body on Saturday last, when C. E. Murphy (3½-h.p. Triumph) made it his own by a second successive win. The contest took the form of a reliability trial from Dublin to Carlow and back, a distance of about 100 miles. Murphy was the only competitor who succeeded in covering the distance with a clean record within the limit of time fixed.

PUBLIC MOTOR SERVICES.

AT the last meeting of the Goring Parish Council, a debate took place on a question raised as to the danger caused by the speed at which motor-buses and charrs-a-banc travelled along the narrow roads through the village, and it was mentioned that at one point the highway was only fourteen feet wide. It was suggested that the route should be diverted to the main road, but it was pointed out in this connection that the motor-buses were a convenience to some of the Goring residents, and that a variation of the route would take the vehicles away from the village. It was eventually resolved to write to the District Council of East Preston, expressing the opinion that the speed of motor-buses and charrs-a-banc along Goring Lane should be limited to five miles an hour.

THE HERON MOTOR COMPANY, John Bright Street, Birmingham, are increasing their machine and repair department to cope with the increased number of orders received for their mechanical pump.

CLUBS AND ASSOCIATIONS.

THE MOTOR UNION.

IN order to encourage motor club meets the Motor Union presents a medal from the design of Professor Sir Hubert von Herkomer, R.A., on the application of any of its affiliated clubs, which is usually awarded by the Club to the competitor who makes the best all-round performance during the day. During the present season medals have been granted to the following:—Coventry, Essex County, South Wales and Mon., Notts., Bristol and Glos., West Surrey, Kent, Sussex County, Ipswich and East Suffolk, Naval, Wolverhampton and District, Sheffield, Manchester, Cheshire, North-East Lancashire, Northamptonshire, and Leicestershire.

AUTO-CYCLE CLUB.

THE awards in connection with the Auto-Cycle Club's six days' trial have been made as follows:—

First Class Certificates and Gold Medal.—J. H. Slaughter (3½-h.p. Triumph), E. S. Myers (3½-h.p. Triumph), J. Marshall (3½-h.p. Triumph), W. H. Wells (5-h.p. Vindec), R. Moore (3½-h.p. Phelon-Moore), F. C. Mustard (3½-h.p. Triumph), W. Smith (1½-h.p. Motosacoche). All the above, except the 1½-h.p. Motosacoche, scored the highest possible of 1,325 marks. The Motosacoche had 1,213 marks, but was specially mentioned by the judges.

First Class Certificates.—W. G. Pople (3½-h.p. Triumph), S. W. Carty (3½-h.p. N.S.U.), T. Woodman (3½-h.p. Vindec), R. M. White (3½-h.p. Hazel), T. K. Hastings (4-h.p. Indian), J. D. Hamilton (3½-h.p. N.S.U.), J. B. Hart-Davies (3½-h.p. Triumph), D. G. Gilmour (9-h.p. Bat), A. S. Phillips (5-h.p. Vindec), W. G. McMinnies (5-h.p. Vindec).

fastest time. The Musical Chairs event brought out nine cars, from a 30-h.p. Renault to a 6-h.p. Rover. The event proved exciting to both competitors and spectators, Miss Wilkins, after a keen struggle, securing the prize. Mr. Aldington won the Motor Bicycle Sea Saw Race, Miss Wedell and Mr. D. Evans the Tilting at the Ring car contest and Miss Ramsey and Mr. Aldington the similar trial for tri-cars. The most exciting event of the day was the Blindfold Driving Test, in which the cars had to be placed at one end of the course backwards to the winning post. The competitors were in turn blindfolded, and placed six yards from their car. At the word to go they had to grope for their machine, get in, and drive backwards towards the left, then drive forward. Six or seven competed; the first round resulting in a dead heat between Mr. D. Evans on a Napier and Mr. C. J. Webb on a M.M.C. Each had another try, and, to the surprise of all, a dead heat was again announced by the judge. A third opportunity was given to each of the two competitors, and on this occasion Mr. Webb succeeded in getting nearer the goal than this rival, and so carried off the well-fought-for prize. Mr. Catherhood was victorious in the Tri-car Blindfold Test. The final event was a Medley Race, in which the drivers had to run to their cars, drive partly round the track, pick up a lady passenger, who had first to tie a bow round the driver's neck, while the driver tied a sash round the lady's waist. Proceeding, a supply of potatoes had to be picked up, which the lady passenger had to drop into flower pots. Afterwards the lady had to carry an egg on a spoon and the driver to burst a toy balloon with one of his road wheels. The prize was won by Mrs. Wallington and Mr. Pattison on a Panhard. Although the weather was dull the rain held off and a very enjoyable

The members of the North Eastern Automobile Association and their friends were invited by Lord and Lady Barnard to an at home at Baby Castle. As will be seen from the photograph reproduced above, there was a large muster of cars. [J. G. Brigham.]

Second Class Certificates.—F. C. Dee (5-h.p. Vindec), F. Cozens (10-h.p. Lagonda tri-car).

Team Prize.—The Triumph Company, for the performance of Messrs. Slaughter, Myers, and Marshall, each of whom gained full marks.

Light-weight Prize, presented by Mr. A. J. Wilson.—Awarded to the 1½-h.p. Motosacoche.

Private Owner's Prize, presented by Mr. T. K. Hastings.—Awarded to F. C. Mustard, 3½-h.p. Triumph.

Prize for Best Performance on a Variable Gear Machine, presented by Captain L'Estrange.—Awarded to the Phelon-Moore machine.

Motor Cycle Medals for Best Performances of Private Owners.—Bicycle Class: F. C. Mustard. Passenger Class: F. Cozens.

Appearance Prize.—4-h.p. Indian of T. K. Hastings.

SOUTHERN.

THE Southern Motor Club held a very successful gymkhana on Saturday last in the grounds of the historical Battersea Rise House, Clapham Common, S.W. The first event was a Glass of Water Race, in which the driver had to hold a glass of water in one hand and start the engine and drive the car round the track with the other. A glass of water had also to be carried by the lady passenger, the winners being the pair who lost the least water between them. Several cars and tri-cars competed, the honours falling to Mr. and Mrs. S. W. Phillpott in the former section, on a 6-h.p. Wolseley, and to Miss Ramsey and Mr. Aldington in the three-wheelers. A Potato Race for Motor-bicycles followed, and was won by Mr. Davies, he succeeding in making two rounds of the track, placing the potatoes in flower pots and afterwards collecting the same, in the

afternoon was spent. Mr. Allen Vickers acted as judge, Messrs. F. C. Pattison and P. T. Worger were the clerks of the course, and Mr. S. W. Phillpott the secretary of the meeting.

AERO.

THE Aero Club of the United Kingdom is represented at the conference of the International Aeronautic Federation now taking place at Brussels.

The committee of the Club is urging that members in charge of balloons should take particular care only to trail in suitable country, and to at once rise when there is any likelihood of a rope doing any damage. They also hope that any member in charge will at once take steps to make compensation for any damage done by trailing, and to report to the club.

HERTFORDSHIRE COUNTY.

ON Saturday, the 7th inst., the Hertfordshire County A.C. held its annual members' hill-climbing handicap, the hill selected on this occasion being Aston Hill, near Tring.

There were twenty-one entries in the three classes into which the programme resolved, Class I., for motor-bicycles, having had to be cancelled on account of a sufficient number of entries not having been received. In Class II., for tri-cars and quad-cars, only one machine succeeded in climbing the hill, a 5-h.p. Riley, entered by Mr. Victor Riley, and was therefore adjudged the winner in its class.

Class III., for cars up to 20-h.p. by the Thornycroft formula, was also won by Mr. Victor Riley, who drove his 12-h.p. Riley and made a very fine performance, making third fastest time of the day. He also made the best handicap performance in all classes.

In Class IV., for cars of over 20-h.p. by formula, Mr. Edwards (24-h.p. Minerva) made fastest time for all classes and also secured the Jay Challenge Cup for the best performance in Classes III. and IV. by a private member of the club. The prize for best handicap performance in this class was won by Mr. Tom Thornycroft with his 14-h.p. Thornycroft Tourist Trophy car.

The full results of the handicap were as follows:—

CLASS II.					
Place.	Car.	Owner.	Driver.	Marks.	
1.	5-h.p. Riley	Mr. Victor Riley	Entrant	1-041	
CLASS III.					
1.	12-h.p. Riley	Mr. Victor Riley	Entrant	0-782	
2.	8-h.p. Phoenix	Mr. J. van Hooydonk	Entrant	0-905	
3.	8-h.p. De Dion	Mr. F. C. Fisher	Entrant	1-103	
4.	15-h.p. Ford	Mr. Rudyard	Entrant	2-400	
CLASS IV.					
1.	14-h.p. Thornycroft	Mr. T. Thornycroft	Entrant	0-883	
2.	24-h.p. Minerva	Mr. E. Edwards	Entrant	0-930	
3.	15-h.p. Humber	Mr. F. W. Sherland	Entrant	1-099	
4.	18-28-h.p. Gladiator	Mr. F. C. Baisley	Mr. J. Fenton	1-128	
5.	28-38-h.p. Gladiator	Mr. F. C. Baisley	Mr. W. Scarf	1-132	
6.	25-h.p. Austin	Mr. O. Thompson	Entrant	1-193	
7.	24-30-h.p. M.P.	Mr. J. Stanning	Mr. W. Monk	1-200	
8.	28-35-h.p. Pilain	Mr. E. Heinemann	Mr. E. Heinemann	1-204	
9.	14-h.p. Germain	Mr. H. S. Adey	Entrant	1-317	
10.	16-20-h.p. Rover	Mr. F. J. Jenkins	Entrant	1-420	

NORTH-EAST LANCASHIRE A.C.

A MOTOR trip for cripples at Preston on Saturday was given through the kindness of the North-East Lancashire Automobile Club. Two hundred children were taken to Lytham. The day was fine, and over forty cars were employed. The children were driven round the town before leaving for Lytham, via Wrea Green and Moss Side. The return journey was made via Freckleton Marsh.

THE result of the pace judging competition held by the Sheffield A.C. on Saturday last was that Mr. T. H. Firth was first and Mr. Beesley was second.

ROAD REPORTS.

HOLYHEAD.—The Holyhead road just outside Shrewsbury will be under repair for a month. The length between the borough boundary and Shelton Oak has long been in a shockingly bad state, giving motor-cars an extremely bumpy run there.

LONGTON.—The stipendiary magistrate at Longton, Staffordshire, has suggested that one of the associations acting in the interest of motorists should put up signals at Trentham warning motorists to drive slowly.

GLAMORGAN.—The Glamorgan County Council has received numerous claims for damages in respect of accidents upon the Mumbles road, which has been treated with tar to prevent the dust nuisance. Several horses had slipped, and people been thrown from vehicles on the tarred road. The County Council repudiate liability.

WIMBLEDON.—A notice board is to be placed on Wimbledon Hill, opposite "Droxmont," notifying drivers of motor-cars and other vehicles of the cross roads at the foot of the hill.

CHICHESTER.—The rain of last week rendered the surface of the main roads of Chichester quite soft, and as soon as a little traffic had passed over them, they were covered with thick black mud—in places several inches deep. The tar, with which the roads have been treated, was being trodden into private houses and shops, with results most exasperating to owners and occupiers.

SCOTLAND.—The Scottish A.C., after negotiation with the respective county councils, have had special caution signals erected at various places in Renfrewshire and Kinairdshire where very special warning to motorists was thought to be necessary. The signals are of enamelled iron, triangular in shape, and bear the crest of the club in the centre.

HAWICK.—The Secretary for Scotland has issued his determination in the matter of the application for a speed limit in the burgh of Hawick. A speed limit has been granted in the congested and narrow streets in the centre of the town, but otherwise the objections which were urged by the club to the application have been sustained.

THE repair shop of the National Motor Academy and Exchange, Ltd., in Boundary Road, Notting Hill, London, W., is being increased to nearly double its size. Practical instructions in motor repairs will now constitute a course of study at the Academy.

To cope with the demands of their trade in tube repairs, &c., the Defiant Non-Skid and Tyre Accessories Company have recently acquired the vulcanising works at 39, Farnival Street, Holborn, E.C., and with these extended facilities will be able to handle all descriptions of tube and tyre repairs, non-skid bands, &c., with the greatest despatch.

CASES UNDER THE MOTOR CAR ACT.

HEAVY HAULS.

The Ayrshire Constabulary are still keeping a sharp eye on motorists who drive at an excessive rate of speed in limited areas throughout the county. Half-a-dozen cases were brought before Sheriff Mackenzie at Kilmarnock Sheriff Court the other day. They were all fined £3 and costs.

A batch of motorists has been in the Mortlake Police Court, where they were informed by the Bench that a distinction was made between the driver of a motor-car and a motor-cycle.

At the Horsham Petty Sessions on Saturday five motorists were fined £16 and costs for exceeding the legal limit at Crawley and Slinfold.

Batches of motorists have appeared this week at Arundel and St. Neots. On Saturday thirteen motorists were fined at Newcastle-on-Tyne, four at Grantham and three at Alnwick.

EXCEEDING PARK REGULATIONS.

Captain the Hon. Henry Beresford attended before Mr. Denman at the Marylebone Police Court to answer a summons accusing him of having driven a motor-car in Regent's Park at a greater speed than ten miles an hour. Mr. Cohen, solicitor, defended. Park constable Petherick gave evidence that shortly before midnight on August 29 he timed Captain Beresford's car over a measured furlong in Regent's Park with the aid of a chronograph and another constable. The car covered the distance at a speed of 18 miles 1,320 yards an hour. Other evidence having been given by park constables, Captain Beresford stated that he was driving the car on this occasion and was accompanied by his wife (Miss Kitty Gordon), Mr. Rose and a chauffeur. Mr. Denham said he had no doubt that the defendant exceeded the speed limit, and fined him 40s., and 2s. costs.

VISIBLE VAPOUR.

James Patterson, 5, Friar-stile Place, Richmond, was summoned for allowing visible vapour to issue from a motor-car in Richmond Park. Park-keeper Bardens said the car was emitting a very dense cloud of vapour. Defendant said the vapour was due to a temporary cause, and he was much obliged to the keeper for telling him, as he was able to adjust the lubricator in about three seconds. He had driven through the park about 1,500 times and was careful to follow the regulations. The Bench imposed a nominal fine of 5s., this being the first prosecution of the kind from Richmond Park.

DANGEROUS DRIVING.

Mr. Oscar Lewisohn, of Ascot, husband of Miss Edna May, was summoned at Eastbourne, on the 6th inst., for driving a motor-car at a dangerous pace in Terminus Road, and with failing to stop when signalled by Police-constable Ashenden, on August 18th. Two previous convictions were proved, and the defendant was fined £25, including costs.

At Thornberry Petty Sessions, Mr. Wingfield Digby, of Sherbourne Castle, Dorset, has been summoned for dangerous driving. The case was dismissed.

The Carnarvon magistrates on Saturday imposed the heaviest fine, viz., £10, they have yet entered upon their books in a case of reckless motor driving.

The Abergele justices were occupied for some time on Saturday in hearing a charge of recklessly driving a motor-car against Mr. W. D. Coddington, 80, The Promenade, Southport. The police witnesses said that the speed of the defendant's car must have been twenty-five miles per hour. For the defence Mr. Connor contended that it was not reckless driving, and that it was a matter of impossibility for the car to have travelled around the corner at twenty-five miles an hour without danger to its occupants. The corner was a dangerous one, and was well known to every motorist on that account, and also on account of the fact that it was closely watched by the police. Again, he contended that so long as the road was clear there was neither a right nor a wrong side. The case was dismissed.

At Wetherby, F. W. Gilliard, of Bradford, has been fined £10 and costs for driving a motor-car to the danger of the public at Boston Spa on Sunday, August 8th. It was alleged that defendant tried to rush between the rear of another motor-car going in the same direction and a horse and trap coming in the opposite direction, with the consequence that a lady cyclist was forced into the gutter, while several other persons had narrow escapes. Defendant pleaded that there was no danger to anybody.

EXCEEDING LEGAL LIMIT.

At Chapel-en-le-Frith, Edward J. Oldenton, of Coventry, was charged by the police with driving at an excessive speed on the Sheffield road, near Bamford, on July 27th. The evidence of Sergeant McCulman and P.C. Walldron was to the effect that in consequence of complaints as to the excessive driving of motors on these roads they were watching in plain clothes. In the space of four hours eighteen motor-cars and very many char-a-bancs, cycles, &c., passed them at a point near Cutthroat Bridge, above Lady Bower, on the Moscar road. The Bench imposed a fine of £5 and costs, and said heavier penalties would be inflicted in future cases.

ANDOVER AGAIN.

Before the County Bench at Andover on Friday, the 6th inst., four cases were heard against motorists, who were fined as follows:—£3 and costs 14s., £3 and costs 12s., £5 and costs, £3 and costs 8s. The first three cases arose at Wallop, the last at Barton Stacey.

RACING AT BROOKLANDS.

A RACE meeting will be held at the Brooklands Motor Track at Weybridge to-day (Saturday), for which the following entries have been made:—

THE FIVE MILE HANDICAP SWEEPSTAKES OF 10 SOV. FOR ACCEPTORS.—(The entrant of the second to receive one-quarter of the stakes.) For motor-cars propelled by means of internal combustion engines only, of a cylinder dimension of 125 or under. Weight 2,700 lbs. Distance about five miles. 5 sov. will be returned to those declaring forfeit within 48 hours after publication of the handicap. S. F. Edge, 45-h.p. Napier; Lt.-Col. C. D. Carleton Smith, 40-h.p. Napier; Capt. G. Llewellyn Hinds Howell, 35-h.p. Iris; J. E. Hutton, 40-h.p. Berliet; J. E. Hutton, 60-h.p. Berliet; F. Guy Lewin, 30-h.p. Peugeot; Harvey du Cros, Jun., 60-h.p. Mercedes; R. Hennessy, 60-h.p. Berliet; Tom Thornycroft, 45-h.p. Thornycroft; E. G. Williams, 40-h.p. Martini; Walter Phillips, 20-h.p. Humber; G. F. Heath, 24-h.p. Minerva; A. Huntley Walker, 30-h.p. Darracq; Hon. H. L. Bruce, 40-h.p. Darracq; O. Cupper, 24-28-h.p. Metallurgique; O. Cupper, 50-60-h.p. Metallurgique; Hugh P. MacConnell, Targa Florio Rapid; L. Carle, 50-h.p. Mors; Corry Hurford, 60-h.p. Mercedes.

THE MERCEDES HANDICAP SWEEPSTAKES OF 20 SOV. FOR ACCEPTORS.—(The entrant of the second to receive one-quarter of the stakes.) For motor-cars propelled by means of internal combustion engines only, of a cylinder dimension of 175 or over. Weight 2,700 lbs. Distance about 3½ miles. 15 sov. will be returned to those declaring forfeit within forty-eight hours after publication of the handicap. S. F. Edge, 80-h.p. Napier; E. Drabble, 120-h.p. Mercedes; J. E. Hutton,

Corry Hurford, 60-h.p. Mercedes; Lewis Aspinall, 50-h.p. Kaiserpreis Minerva.

THE FIRST 90-H.P. RACE OF 150 SOV.—The entrant of the winner to receive 100 sov.; the entrant of the second 40 sov.; and the entrant of the third 10 sov. For motor-cars propelled by means of internal combustion engines only, of a cylinder dimension of 225.1 or under. Weight 3,000 lbs. Distance about five miles. J. E. Hutton, 120-h.p. Mercedes; Warwick Wright, 100-h.p. Darracq; F. R. Fry, 120-h.p. Mercedes; A. Huntley Walker, 120-h.p. Darracq; E. Drabble, 120-h.p. Mercedes.

In those races which have not attracted the minimum number of entries previously determined and announced by the executive, the value of the prize money will be proportionately reduced.

In the Five Mile and Mercedes Sweepstakes Races which will be held on the Brooklands Course to-day, the following are the first actual handicaps that have been arranged by the Club, although weight allowances have been granted by formulae in selling races at previous meetings.

For the Five Mile Handicap the following allowances have been made:—S. F. Edge, 45-h.p. Napier (scratch); J. E. Hutton, 60-h.p. Berliet, 76 yds. start; H. Du Cros, 60-h.p. Mercedes, 76 yds.; R. Hennessy, 60-h.p. Berliet, 76 yds.; T. Thornycroft, 45-h.p. Thornycroft, 76 yds.; Corry Hurford, 60-h.p. Mercedes, 76 yds.; L. Carle, 50-h.p. Mors, 87.8 yds.; O. Cupper, 50-h.p. Metallurgique, 98 yds.; F. Guy Lewin, 30-h.p. Peugeot, 481 yds.; H. McConnell, Rapid, 481 yds.; G. L. Hinds Howell, 35-h.p. Iris, 618 yds.; E. Williams, 40-h.p. Martini, 659 yds.; Lt.-Col. C. D. Carleton-Smith, 40-h.p. Napier, 738 yds.; W. Phillips, 20-h.p. Humber, 750 yds.; Hon. Lyndhurst Bruce, 40-h.p. Darracq, 761 yds.; J. E. Hutton, 40-h.p. Berliet, 927 yds.; A. Huntley Walker, 30-h.p. Darracq

The Commercial Vehicle Trials.—Some of the Lorries en route for Reading.

120-h.p. Mercedes; F. R. Fry, 120-h.p. Mercedes; A. Huntley Walker, 120-h.p. Darracq; A. Huntley Walker, 120-h.p. Darracq.

THE FIRST 40-H.P. RACE OF 150 SOV.—(The entrant of the winner to receive 100 sov.; the entrant of the second 40 sov.; and the entrant of the third 10 sov. For motor-cars propelled by means of internal combustion engines only, of a cylinder dimension of 100 or under. Weight 2,500 lbs. Distance about 2½ miles. Lt.-Col. C. D. Carleton Smith, 40-h.p. Napier; Capt. G. Llewellyn Hinds Howell, 35-h.p. Iris; Harvey du Cros, Jun., 40-h.p. Austin; S. Gore-Browne, 24-36-h.p. Fiat; E. G. Williams, 40-h.p. Martini; A. Huntley Walker, 30-h.p. Darracq; M. F. Mieville, 40-h.p. Berliet.

THE FIRST 26-H.P. RACE OF 150 SOV.—The entrant of the winner to receive 100 sov.; the entrant of the second 40 sov.; and the entrant of the third 10 sov. For motor-cars propelled by means of internal combustion engines only, of a cylinder dimension of 64 or under. Weight 2,000 lbs. Distance about 2½ miles. F. S. Bennett, 20-h.p. Cadillac; J. E. Hutton, 22-h.p. Berliet; J. E. Hutton, 22-h.p. Berliet; H. du Cros, Jun., 20-25-h.p. Mercedes; Tom Thornycroft, 14-h.p. Thornycroft; H. E. Hall, 14-h.p. Germain; Walter Phillips, 15-h.p. Humber; A. Huntley Walker, 16-18-h.p. Darracq; E. A. Rosenheim, 16-25-h.p. Arrol-Johnston; O. Cupper, 24-28-h.p. Metallurgique.

THE FIRST 60-H.P. RACE OF 150 SOV.—(The entrant of the winner to receive 100 sov.; the entrant of the second 40 sov.; the entrant of the third 10 sov.) For motor-cars propelled by means of internal combustion engines only, of a cylinder dimension of 150.1 or under. Weight 2,700 lbs. Distance about 3½ miles. E. Herington, 35-h.p. Ariel-Simplex; S. F. Edge, three 60-h.p. Napiers; Capt. Hon. D. Carleton, 60-h.p. Napier; J. T. C. Moore-Brabazon, 35-h.p. Minerva; A. Huntley Walker, 30-40-h.p. Darracq; O. Cupper, 50-60-h.p. Metallurgique;

(120 mm.), 927 yds.; A. Huntley Walker, 30-h.p. Darracq (117 mm.) 1,050 yds.; G. F. Heath, 24-h.p. Minerva, 1,565 yds.; Oscar Cupper, 24-h.p. Metallurgique, 1,750 yds.

The Mercedes Handicap will be over a distance of three and a quarter miles and the following allowances have been made:—S. F. Edge, 80-h.p. Napier (scratch); A. Huntley Walker, 120-h.p. Darracq (190 mm.), 87 yds.; A. Huntley Walker, 120-h.p. (180 mm.), 232 yds.; J. E. Hutton, 120-h.p. Mercedes, 387 yds.; F. R. Fry, 120-h.p. Mercedes, 387 yds.; E. G. Drabble, 120-h.p. Mercedes, 387 yds.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

C. HOODYDONK AND CO.—£1,000. To acquire the business of a motor component and accessory dealer and agent carried on by Mr. C. Hoodydonk, formerly at 6, Leather Lane, E.C., and now at 45, Broad Street, Bloomsbury, with his agencies for Dependence lamps and Longemare carburettors. First directors: Messrs. C. Hoodydonk (managing director) and D. Mills, 45, Broad Street, Bloomsbury, W.C.

AUTOCAR MART.—As title. No initial public issue. Registered without articles.

SULTON MOTORS.—£1,000. No initial public issue. Registered without articles. Mansion House Chambers, E.C.

THE Coventry Chain Company (1907) Ltd., have sent us a handy little cigarette case, duplicates of which, they inform us, they will send to any of our readers, gratis, on application to their works at Coventry.

FORTHCOMING EVENTS.

SEPTEMBER.

- 14th (S.).—Motor Union Meet at Leicester.
 Brooklands A.R.C. meet.
 East Surrey A.C. run to Cranleigh.
 Essex M.C. 200 miles non-stop run.
 Harrogate M.C.C. hill climb.
 Cheshire A.C. gymkhana.
 Sussex County A.C. run to Hindhead.
 West Essex A.C. 100-mile reliability run for motor-cycles.
- 15th.—"The Industrial Motor Review" for September will contain a pictorial and descriptive report of the Commercial Vehicle Trials of the R.A.C.
- 18th (W.).—Commercial Vehicle Exhibition at Birmingham.
- 21st (S.).—Nottinghamshire A.C. hill climb.
 Southern M.C. closing run at Ewell.
 Auto Cycle Club meeting at Lincoln.
 Derby A.C. run to Dovedale.
 Blackheath A.C. run to Westerham.
 Brooklands A.R.C. meeting.
 Hertfordshire County A.C. members' driving test.
- 23rd (M.).—Inaugural dinner in connection with the northern offices of the Automobile Association at Manchester at the Midland Hotel, Manchester.
- 28th (S.).—Ipswich and East Suffolk A.C. petrol consumption trial.
 Midland A.C. at Tudor Grange, Solihull.

OCTOBER.

- 5th (S.).—Brooklands A.R.C. meet.
- 12th.—Close of the Commercial Vehicle Trials. Final run from Baldock to Dalston, London, N.
- Southend M.C. closing run of the season to Witham.
- 19th (S.).—Auto-Cycle Club's quarterly trial.

MARCH, 1908.

- 21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

LIGHTING-UP TIMES—LONDON.

Sept. 14th—7.18	16th—7.13	18th—7.9	20th—7.4
" 15th—7.16	" 17th—7.10	" 19th—7.6	" 21st—7.2

To ascertain the approximate times in Glasgow an addition of 20 min. should be made to the above figures; in Manchester an addition of about 7 min. is necessary.

AUTOMOBILE ACCIDENTS.

A SERIOUS accident occurred on Sunday at Berriedale, Caithness, to a motor-car in which Sir William Cruickshank and his wife, son, and daughter were on their way north to Barrock House. When descending Berriedale Brae, the chauffeur lost control of the car. To avoid certain calamity at the foot of the hill, he ran the car into the wall by the roadside. All the occupants were thrown out, and the car, which took fire, was destroyed. Sir William, his wife, and daughter were removed in an unconscious condition to Langwell Cottage Hospital, near the shooting lodge of the Duke of Portland. Sir William recovered consciousness on Monday. The others were cut and bruised, but not seriously hurt.

A CYCLIST, named Edward Akers, living at Pennythorn Road, Peckham, was killed by a motor-car outside the village hall of Bromley Common, Kent, on Saturday. He was cycling to Farnborough when the motor-car collided with him. A doctor who was called pronounced life extinct. He was removed to the mortuary, and the chauffeur was taken to Bromley Police Station.

A MOTOR fatality occurred at Edmonton on Saturday night. Several boys ran after a heavy motor-lorry, belonging to Mr. J. Joyce, of Tottenham, and one of them caught hold of the side of the rear vehicle. He was jerked off and fell under one of the wheels, which passed over him, crushing his leg. He was removed unconscious to Tottenham Hospital, where he died a few hours later.

AN inquest was held on Monday at Portmadoc respecting the death of Mr. Cyril Bury, a civil engineer, who, while cycling on Sunday afternoon, crashed into the motor-car of Mr. Harold Tunnycliffe, of Churchill, Somerset, at a curve on Penygwryd Hill, Carnarvonshire. He and his brothers were cycling to Portmadoc, and Mr. Tunnycliffe was going from Beddgelert to Llandudno. The evidence showed that deceased lost control of his bicycle. He fractured his arm and leg, and died five hours later. A verdict of "Accidental death" was returned, and the motorists absolutely exonerated.

VAUXHALL MOTORS, LIMITED, Luton, have appointed Messrs. Scott, Morgan and Company, Christchurch, New Zealand, as agents for the 12-16-h.p. Vauxhall car.

IN the Pekin-Paris run the Spyker car covered a distance of 7,500 miles from Pekin to Moscow with the same set of Hutchinson tyres on the back wheels. Such a distance is good work under any circumstances, but, taking into consideration the state of the roads over which this run has been made, the distance is almost unsurpassed for one set of tyres.

POLICE TRAPS.

AT the Mortlake Police Court a park-keeper, giving evidence against a motorist summoned for exceeding the regulation limit, admitted that the trap was "rather down-hill."

RIPLEY is again the centre of police operations against alleged speedy motorists.

BAMFORD is the scene of police activities—a point of interest to Sheffield motorists.

ECCLIFECHAN.—At the cross roads on the main highway between Glasgow and Carlisle, Stirling, in Wallace Street, the police now time motorists.

NEWTIMBER, between seven and eight miles from Brighton, has a police trap.

CHRISTCHURCH, all the roads leading into the town are dangerous at various times.

HAMPSTEAD, the Fitzjohn's Avenue trap is again at work.

TADCASTER has its police trap—energetically and frequently operated.

A POLICE TRAP is in operation on the Bangor and Holyhead road, near Holyhead.

BUSINESS NEWS.

"THE greater part of our work arises out of the defects of other firms' material or workmanship, with, of course, a lot from simple smash-ups," remarked the manager of the motor department of Messrs. Smith, Parfrey and Company, on the occasion of a recent tour round the Pimlico Wheel Works, in Fulham Palace Road, S.W. "It is no strange experience for us to have a car's wheels delivered here in a couple of sacks, or have a car shot out of a builder's cart, like a heap of gravel. In fact, unless you saw some of our jobs arriving, you would never believe that a car could be so utterly wrecked as are some of them." The company do a large amount of repair work for insurance offices. Messrs. Smith, Parfrey and Company's experience of wheel-building and spring work antedates the first of motor vehicles by many years. Some of their most satisfactory jobs have been those in which they have transformed a most uncomfortable machine into a luxuriously easy riding car, simply by modification of the springing. They now do the under carriage work of most of the leading garage and motor repair works concerns in the kingdom.

A NEW material for brazing cast iron, known as Castolin, is being introduced into this country by Mr. W. H. Lillienfeld, of 11, Queen Victoria Street, London, E.C., and it is claimed that by its means it is possible to so repair damaged castings that they will not break a second time in the same place. Castolin is a product which has been worked out in the laboratories of Messrs. Wassermann and Company, Lausanne, Switzerland; it is rubbed into the pores of the broken surfaces, which have been previously cleaned with a wire brush. The pieces, joined together accurately with clamps, are placed in a clear charcoal fire, assisted by a gas blow pipe for large castings. When they have become hand-warm more of the Castolin is rubbed into the fracture, and the line of the same covered with plenty of borax and "Castolot" spelter. The casting is then replaced in the fire and brought up to a red heat until the spelter runs freely with a bluish flame. The brazed casting, after polishing, is stated to be as good as new in appearance, and, as has been shown by repeated tests, the fracture will resist breakage better than the rest of the piece. The product should be of interest to motor-car repairers, as, in dealing with damaged castings, not only is the latter itself saved but also the time usually wasted in getting another casting from the foundry.

MR. E. ARNOTT has sent us particulars of a new wheel for motor vehicles in which he has become interested. It is known as the "Lynton" resilient wheel, which is claimed to give the resiliency of pneumatic tyres with none of the drawbacks of the latter. Not having had so far an opportunity of inspecting the wheels, we can only briefly mention that they are built up of two discs, one fixed to the hub and the other free to rock slightly in any direction, and a solid rubber tyre of special section, and that the road shocks are absorbed at the point of contact of the tread on the road and at the sides of the tyre at the top of the rim.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, SEPTEMBER 21, 1907.

[No. 446.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

MUNICIPAL officers are becoming motorists. They recognise that the motor-car is something more than a means of amusement; it saves time, economises labour, and thus contributes to the general efficiency of the public service. Most of the leading corporations and many of the county officials now own automobiles,

with which they make tours of inspection, and generally speed along their duties in a way that was not previously possible. Birmingham presents an excellent object lesson with regard to the city use of the motor-car. Its Tramway Department owns a car for its inspectors in their daily surveys of the line; a motor lorry is employed to convey stores from one depot to another; a motor repair wagon is always ready for breakdowns on any part of the system, and a motor tower wagon has lately been added to the automobile stud. Consequently, the horse is being displaced throughout the tramway system of the Midland city. The Water Department has to supervise seventy-four miles of watercourses, and two motor-cars are employed, the aggregate mileage of which will be about 18,000 this year. A couple of light vehicles are in service in the Electricity Department, and two larger ones are owned by the Fire Department. Thus it will be seen that the motor-car is engaged in almost every department of the municipal activity; and it is gratifying to know that in no branch of the service has it failed to justify its use.

The Chassis and the Body.

MR. G. H. BAILLIE has been giving his views on the motor-car from the engineer's point of view. He discussed the practicability of getting proper accommodation for five or seven people within a wheel base of reasonable length without giving up the perfections with which ten or fifteen years of work had endowed the modern chassis. Up to the last year or so the chassis builder has troubled little about the comfort or convenience of the carriage; he has striven for reliability and efficiency. It was perhaps better to reach the end of a journey with a certain amount of discomfort than to be stranded half-way in the most luxurious vehicle. A standard type of chassis has been evolved as the result. Mr. Baillie considers that it is possible to attain an ideal motor carriage having a centrally-swung body on a wheel base of reasonable length, but only by disposing the engine within the length occupied by the body. The only way which seems generally practicable in his view is to adopt a horizontal engine

with longitudinal shaft, with cylinders opposed or side by side. The experience of the last few years, however, affords very little encouragement to the designer of such a chassis. Some years ago horizontal engines were fairly common in England, and very common in America, but none have survived. All have been discarded in favour of vertical engines. Carriage-builders cannot achieve the same progress as the engineer while they have to submit to the dictation of their customers as to what kind of body they must build for the chassis the customers buy. The chassis-builder has submitted to no such dictation. He builds his own chassis, and the carriage-builders should, in their customers' as well as their own interests, adopt the same attitude. It would be the first step towards making bodies in quantity, instead of one by one. The second step must be made alongside the chassis-builder, and is to determine standard sizes of frames.

The Delivery Van.

THAT the day of the light motor delivery van is near at hand is evident from a careful observation of the streets of the Metropolis. The speedy conveyance of goods is an essential part of modern business; the motor-car is the most rapid means yet available for getting about the streets; and there are indications at all the trade exhibitions, such as the Bakers' Market at the Agricultural Hall, London, last week, that traders of every variety recognise the early advent of the new force in traffic. In fact, the more far-sighted of manufacturing firms are preparing for a great movement in this regard during the coming season, and interest is likely to be somewhat diverted from the purely pleasure car to the lighter type of commercial vehicle required by tradesmen for quick delivery. So far as it has been tried it has succeeded; and its scope is infinitely large.

Lincolnshire's Attitude.

ELSEWHERE we publish a letter from Dr. Godfrey Lowe, written at the request of the committee of the Lincolnshire A.C., which we would commend to the serious consideration of our readers in other parts of the country. The Fen district has hitherto been singularly free from the police traps which have spoiled the landscape for motorists in many places. But the conduct of some drivers who reside outside the county, although sometimes travelling therein, threatens to destroy the goodwill that now prevails between automobilists and officials. The result would be harassing to the local motorists, whose good behaviour is recognised by the local police, and also a deterring force to the general prosperity of the movement. We trust, therefore, that the warning of Dr. Lowe and his colleagues will

not be in vain, and that, by maintaining that careful regard for the comfort of other people in the county which has hitherto characterised motorists, harsh treatment by the police authorities will be averted.

The Motor in the Harvest Field.

ACCORDING to the "Industrial Motor Review" great interest is being taken in France in the subject of the motor in the harvest field, and British inventions have been taking part in some important trials at Chalons-sur-Marne. In the

English Fens, too, some interesting experiments have lately taken place which should do much to establish the position of the petrol motor in farming operations. These were held on the farm of Messrs. Dennis Bros., at Kirton, a typical agricultural village four or five miles from Boston, in Lincolnshire. An acre of standing corn was cut, bound, threshed, and ground by the motive power of an agricultural tractor working with a petrol engine of 50-h.p., and an acre of ground was also ploughed, cultivated, drilled, harrowed, and sown for a new crop within seven hours. This constitutes a world's record. The tractor, thresher, drum, mill, cultivator, drill, and harrow were all British make, while the harvesting machine hailed from Canada. The tractor was by Messrs. Saundersons, of Bedford.

The Cardiff Club's Hill Climb. Mr. C. Garrard at the wheel of the 16-h.p. Talbot, the winner of the contest, the car being awarded a silver cup for the most meritorious performance. The vehicle also secured the Gold Medal in Class III.

Motor Cycling Organisation.

MOTOR-CYCLISTS are gathering in force at Lincoln to-day (Saturday) in order to discuss the organisation of the movement generally and the development of club life in particular. At present the Auto Cycle Club is the responsible authority

for the motor-cycling world; but although there are more than one hundred societies in Great Britain belonging exclusively to motor-cyclists, only a few have seen their way to affiliate with the central body. During the present year the unsatisfactory character of the position has been forced upon all identified with the motor-cycle, with the result that the Auto Cycle Club has wisely joined with the Lincolnshire Motor Cycle organisation in convening to-day's conference. The meeting will be officially received by the deputy Mayor of Lincoln, whose interest in motoring was demonstrated when the Motor Union met in the same city a few months ago. Apparently an endeavour will be made to contain the controlling influence within the Auto Cycle Club, while providing fuller latitude for the representation of provincial opinion thereon. It has frequently been pointed out that when the Royal Commission sat motor-cycles had no voice in the matter, their views being only incidentally brought forward by the advocates of the motor-car.

Mr. Frederic Harrison's Views.

STRANGE ideas have evolved from the active and fertile brains of leaders of sections of people whose notions present difficulties of belief to the majority of people. Not everyone could understand Comte and several of his friends; Mr. Frederic Harrison is an exception, as may be proved by his appreciation of those whom many would regard as peculiar. Some may even go so far as to say that Mr. Harrison has peculiar views himself, and the "Times" of Saturday bears evidence on this point. For there, in all the glory of large type, is an epistle from the Priest of the Positivists that breathes the spirit of Old Moore in its portentous avalanche of disaster. Verily the coming of the car has brought peril into the land—lowered rateable values, slaughtered animals, terrorised people, and, worse than all, caused Mr. Harrison to indict a letter to the Press. After calling "certain motorists" brutes and the patrons of an "idiotic sport," the plan is unfolded by the author in words which we cannot do better than quote in their entirety. This is done in the succeeding paragraph.

The New Tolls.

"ALONG all main roads erect small toll-boxes having a swing iron bar across the roadway, at intervals of about fifteen miles apart. Each toll-house to contain a police official and to be connected by telegraph or telephone with the next toll-house on either side. By a new and amended Motor Act every motor would be required to pull up at the toll-bar, where the exact time would be entered and compared with the time of the last toll-bar passed, thus obviating all question of any 'measured half-mile.' The motor would then pay the toll-bar due—say from 10s. to £5, according to its "h.p."—and in case of infringement of the law, the car would be detained in the garage attached to the toll-house. The dues paid on passing each bar would serve for a special county fund to repair and tar the road, and meet expenses of bar and officials, telephone and other charges. No more police traps, no more uncompensated injury to public property, no more bolting of road hogs! The record of each run between bars would be conclusive evidence, and the motorist would fairly pay for the losses he caused. The amended Act should also abolish the derisive alternative of a fine for misdemeanour. The only legal penalties for deliberate and systematic offences should be imprisonment of the actual driver, or owner if present at the offence, or the confiscation of the car, and its ultimate sale, to go to the special county motor defence fund."

A Prospect of the Future.

THIS is really a delightful prospect. England is to be "harrisoned" with a cobweb of toll bars, studded with policemen, who will collect tolls—corresponding to fines—detain cars, and generally regulate the roads of the country as though they were the exercise yards of a county penitentiary. The electrical industry would rejoice over the supply of telegraphs and telephones, the police would probably play cards in their toll boxes instead of hide and seek behind the hedges, and the authorities generally would have a good time in annoying motorists. But the complexity of the scheme is its condemnation. Something simpler would be to place trees across the path, as was done at High Wycombe in the early days.

The Motor Union at Leicester.

LAST week's meeting of the Motor Union at Leicester was the final gathering of that organisation so far as the provinces are concerned for the present year. Looking back over the programme of 1907, the proceedings at Leicester were as varied and interesting as either of the preceding gatherings at Lincoln and Southport, the local club and the municipal

authorities combining in their welcome to the visiting motorists. At the dinner which is always a prominent feature of the day's gathering, Mr. C. D. Rose, M.P., presided, being supported by many of the chief men of the county and borough. The chairman referred to the good work done in influencing public opinion, and after referring to the Fuels Report and the question of danger signals, went on to say that they could not always expect to sail on a smooth sea and under an open sky. A small cloud had arisen on the horizon. He recognised the work done by the Automobile Association in its own sphere, but the provision of road agents had been forced on the Union by its own members, by the authorities, and by the public, and greater attention had to be paid to inconsiderate driving through towns and villages where speed limits were demanded. They had taken a generous course in suggesting arbitration between the two bodies, and he trusted that their advances would be accepted in the same spirit by the Automobile Association. Major J. A. Cole, J.P., Mr. E. G. Mawbey, Mr. Rees Jeffreys, and Mr. G. T. Langridge also spoke.

varied efforts of all parties to effect sales of cars so as to get quite clear for the opening of the 1908 season.

Commercial Vehicle Trials.

THE second week of the Royal Automobile Club's Commercial Vehicle Trials was begun on Monday, when the cars travelled from Gloucester to Worcester by various routes. Although some of the classes had to negotiate difficult country, the weather was glorious and the roads were in excellent condition, and the splendid result of forty-five non-stops, not counting the performances of three cars, which are under consideration, was achieved. On Tuesday, fifty-four vehicles reached Birmingham, and up to the night of that day thirteen vehicles had made non-stop runs for every day of the trials, these being a Darracq delivery van and a Unic van in Class A, a Lacre box van in Class B, a Dennis van in Class C, a Halford lorry, a Siddeley wagon, a Straker-Squire van, a Churchill lorry, a Dennis van, a Commercial Cars lorry, and a

King Edward spent last week at Rufford Abbey, near Doncaster, as the Guest of Lord and Lady Saville. The photo reproduced above depicts His Majesty leaving the Abbey for a motor trip.

The Plaintiff of the Agent.

AMID the confusion that prevails in some departments of the automobile industry the plaintiff of the agent is borne in upon us by correspondence and conversation, combining to confirm the impression that his lot, like that of the policeman, is not a happy one. In many cases makers of cars by speeding production have attempted to hustle the vehicles into the showrooms of their clients, who have found conditions somewhat adverse to their going to customers in similarly quick time. Both parties have been disappointed, and the roseate hue that was prognosticated at the dinners and banquets with which the long evenings of last November were beguiled has been as intermittent as the sun of 1907. This discontent has resulted in agents and manufacturers attempting to shuffle quietly from each other's sight in the hope of effecting better arrangements for the year that is coming. Hence the tension which is generally felt throughout the industry—one result of which is seen in the

Thornycroft lorry in E Class, a St. Pancras steam lorry in Class F, and the Burrell steam tractor. On the run from Worcester to Birmingham, thirty-six of the cars achieved non-stops, and in most of the other cases the stoppages were brief; all the arrivals being before 6 p.m. On Wednesday, the competing vehicles were exhibited at the Aston Lower Grounds.

SIR A. J. MACDONALD, one of the pioneers of motoring in this country, has recently taken out a patent for a new non-skid device. The arrangement comprises a pair of depending arms or sprags pivoted to the frame of the vehicle, a little to the rear of the back axle. The arms are normally held clear of the road surface by springs attached to the frame, but can be lowered so as to press firmly on the road by means of a pedal connected to longitudinal rods linked to the frame and passing rearwards from beneath the driver's seat to the arms. The longitudinal rods are connected to the sprags through springs, which allow the sprags to yield on encountering a lump in the road.

B

THROUGH HOP LAND.

A PLEASANT RUN WITHIN EASY REACH OF LONDON.

NO more delightful run can be had at this time of the year than through the hop districts of Kent. Moreover, for the most part, the way lies over tarred roads. Those who indulge in a car ramble through the smiling county of Kent at this season will, doubtless, be struck by the resemblance that exists between the landscape of our charming home county and that of Southern Italy. The wreathing hops rising in regular avenues against a sky of cobalt, the bright patches of colour afforded by the multi-coloured kerchiefs of the pickers, all serve to enhance this pleasing resemblance. With a small stretch of imagination one is transferred to the sunny South, where the wheels of life run easily in well-lubricated grooves.

Gladly I accepted the invitation from a friend owning a 20-32-h.p. car to accompany him in a motor pilgrimage through Hopland. Leaving London by way of Lewisham and Bromley, the traffic of the Sevenoaks road involved careful driving. At Farnborough we passed a road agent, but, as we preserved a decorous pace through the village of this name, our friend did naught but wave his hand, seemingly indicating that the road was free from any trap ahead. To Riverhead the road is tarred, the long rise through Sevenoaks being taken in good style, as was the succeeding stiff rise to the crown of Riverhill. At the last bend there was a large car stationary, evidently through over-heating, as the radiator was steaming vigorously.

Shortly before Hildenborough a short cut to Tunbridge Wells, *via* Penshurst, was taken. This road is not generally known, but effects a saving of some miles over the direct road. Moreover, the scenery along this stretch is simply delightful. Cosy, picturesque, flower-embowered country homes lay buried on either side of the road, and it was difficult to realise, judging by the surroundings and absence of traffic, that we were but a little over a score of miles distant from town. Through Leigh, with its old church and houses, the way lay over a delightfully shaded road into Penshurst, passing Penshurst Place and grounds—one of the finest seats in Kent. At the far end of the village was noticed a novel blending of the old and the new, a curious old blacksmith's shop, that appeared as if it had been undisturbed for centuries, yet bearing the modern legend, "Motor Repairs."

Shortly after Penshurst the road forks. We followed the left hand road leading past a fair-sized hop garden, and then commenced a stiff climb to Fordcombe. This was taken without falter, though it is not far short of Westerham in gradient. Then past Langton and its green a gentle undulating road led on to Tunbridge Wells Common, the views from this point, especially overlooking Crowborough, being grand. Quite unnecessary to state, the road was tarred, and, judging by the amount of car and carriage traffic, it was evidently the height of the season there. Despite the vaunted attractions of rival Continental resorts, the "Wells" still holds its own as a fashionable and popular inland watering resort. And the place bears a hallowed memory in motor history, for was it not on the broad common that the first motor meet in this country was

held? Here also resides Sir David Salomons, the pioneer of English motorists, and a local agent displays photos of some of his most historical cars.

A long rise out of Tunbridge Wells led to Pembury, on the Hastings road, which, however, is left at the end of the village, the left hand road leading to Paddock Wood and Marden. After a few miles over level and winding road we were in the thick of the hop country. Gardens with splendid crops bordered each side of the road, and extended back for some considerable distance. Picking was in full progress, and it was interesting to see even tiny mites of children assisting. Here and there against the tender grey-green of some distant woodland rose the thin shafts of smoke that denoted the encampments of the hoppers. Blue and ethereal rose the vapour of the camp fires, till, touching the more azure blue of the heavens, it dissolved and was lost, bearing with it the soul of the appreciative beholder to realms far above the sordid cares of earth.

We were lost in admiration of the scene when—whop! Our soul fluttered back to earth with a broken wing, for a well-directed clod of earth caught us shrewdly on the left cheek. The trail of the road hog was laid across our paradise, and we searched with wary eye for the hop-hog. Who did this thing?

By a strategical retreat under cover he was lost to view, and we were left to rub our injured head dolefully, what time we reflected upon the debased nature of mankind in general and hop pickers in particular. We would fain have dismounted and joined battle with him. Thrice is he armed who hath his quarrel just. But fifteen times must he be armed who would venture to bring matters to a crisis with a hop picker backed by forty-five companions. Whereon we drove on, leaving the hop hog to further vent his spite upon the next unfortunate motorist who might happen to come along. Turning to the left after Paddock Wood, we followed the road to Watlington, at which railway station many hundreds of hop pickers are deposited. Thence the road led past Offham with its green and well-preserved quintain post. A few miles further the main Maidstone road was joined at Borough Green, and almost reluctantly

we turned the bonnet London-wards. At Ightham, an old-world village, we stopped for dinner with appetites well whetted by the run. The George and Dragon, like many of the houses of the quaint old village, has escaped the desecrating touch of the modern restorer, and, with its ancient timbered front and old-fashioned interior, is a welcome contrast to the modern inn. Following an excellent meal we started for the homeward run, the stiff hill out of Ightham being taken in excellent style. Then through Seal and past the Bat and Ball station at Sevenoaks, the outgoing route being joined at Rive Head. Thus ended as pleasant a trip as is to be found within a forty mile radius of London.

C. M. F

The Ivel Agricultural Motor on trial at Chalons, France.

A BUENOS AYRES correspondent writes that commercial motor vehicles are being extensively used in the Argentine Republic. Scarcely a business house of any standing can be found that does not own at least one delivery van, and any passer-by may see in the streets of Buenos Ayres huge vehicles of this sort carrying big loads to the several railway stations.

THE WEIGEL 25-H.P. CAR.

WE are this week able to illustrate and briefly describe the new 25-h.p. car which Weigel Motors, Ltd., have just put on the market, to meet the demand for a British-built vehicle of medium power. Figs. 1 and 2 show the general arrangement of the chassis in elevation and plan; it will be seen that, although the car is built very low, and thus eminently suitable to receive landaulet bodies, clearance has not been sacrificed. The frame, which is of 3 per cent. nickel steel, is composed of three cross members and two side members. The side members, which are of \square section, are narrowed at the forward end to permit of a large lock to the steering wheels, and raised and "outswept" at the extreme rear to clear the back axle, and to allow the rear half springs to be bolted direct in the side members, thus doing away with the usual

the tappets are adjustable in length so that the necessary clearance may be regulated to a nicety; while, to ensure perfect alignment between the valves and tappets, the flanges at the base of the cylinders are extended to carry the valve tappets, which bear on the cams through the medium of rollers. The crank shaft, which is of vanadium steel, and ground dead to gauge at all the journals, is supported on three long phosphor bronze bearings, lined with white metal, a system of felt washer oil retainers being employed to prevent any oil escaping from the crank chamber. Compression cocks are provided to each cylinder, while there is a tap to the base chamber of each pair to enable the spent lubricating oil to be drawn off. The standard ignition is effected by a gear-driven Simms high-tension magneto located on the inlet side, provision being made for the fitting of a supplementary accumulator ignition if desired. The magneto, as also the pump, can be instantly dismantled without

Fig. 1 and 2.—Elevation and Plan of Chassis of Weigel 25-h.p. Car.

attachment by brackets. The springs are of a good length, a feature being the provision of an oil channel between each leaf; furthermore, all the shackle bolts are formed hollow to permit of efficient lubrication.

The motor (Figs. 3 and 4), which is bolted direct to the side members of the frame, comprises four cylinders cast in pairs, the dimensions being 110 mm. bore by 120 mm. stroke. Mr. Weigel informs us that the cooling system has been specially studied to insure immunity from over-heating under the most severe climatic conditions, and so meet the requirements of motorists in the Colonies as well as in this country. To this end very large water jackets are provided, in addition to a high-capacity gear-driven centrifugal pump and honeycomb radiator with air-inducing fan. The interchangeable valves—in 25 per cent. nickel steel—are of large diameter, and are placed on opposite sides of the cylinders, the inlets being on the right and the exhausts on the left. To obtain absolute silence in running

disturbing any of the timing gear, a special ring coupling being placed between each of these units and its driving shaft.

The power is transmitted from the engine to the gear-box through an oil-containing metal disc clutch and a system of universal joints, which not only allow for any want of alignment between the engine and gear-box, but also permit the clutch to be dismantled without disturbing either of the two parts just named. The self-contained clutch spring rides on a ball thrust race, and another ball thrust race is placed behind the clutch disengagement collar. The gear-box (Figs. 4 and 5), is arranged to provide three forward speeds, with a direct through drive on the top gear, and one reverse. There is no split in the aluminium gear-box, but a large and rapidly-detachable cover affords an easy method of inspection. The gear wheels and shafts are made from "Ubas" steel case-hardened and ground where necessary; all the shafts run on Hoffmann ball bearings, and oil-retaining felt washers are employed to prevent any unsightly

escape of oil. The method of striking the gears is on special lines, it being absolutely positive both in action and locking. It is effected by a rocking lever working through a gate quadrant, the rocking lever engaging with either striking shaft as it rocks through the gate. The spring-operating arms, together with the special profile of the gate, positively lock the gears in mesh, and a detent rod prevents the reverse gear being inadvertently engaged.

From the gear-box the power is conveyed to the back axle by means of a cardan-shaft and bevel gear. The shaft is provided with a specially designed universal joint at each end, the torque

Fig. 3.—Sectional Elevation of Motor.

being resisted by a γ rod ending in a swinging ball and socket joint. As the road wheels are carried on the axle casing the live shafts have only to withstand the driving effort. Ball load and thrust bearings are employed where necessary, and the bevel and crown wheels are formed with a large tooth profile which should ensure extreme silence in running.

The steering gear is of an improved worm and segment type, both the worm and the segment being supported on adjustable ball bearings. All the steering joints are formed by a ball piece held between two sockets. The front axle is of the dropped

Fig. 4.—Cross Section of Motor.

type and is of I. section nickel steel; the weight of the car is supported on ball thrust races fitted under each swivel.

The gear-box carries two external contracting brakes; the one at the front of the gear-box comes into operation when the clutch pedal is depressed beyond a predetermined limit, and serves to prevent the gear pinions spinning, thus avoiding all noise and wear when changing gear. The main foot brake, immediately in the rear of the gear-box, is quite independent of the clutch, and is of ample proportions. The adjustment of both these brakes is readily effected by turning a self-locking butterfly

nut, a system of springs preventing any rattle in the connections. Expanding brakes, operated by hand through a side lever, are provided in the rear hubs, while a ratchet sprag is formed on the differential casing for use in case of emergency.

The car has been specially designed to take a side-entrance or landaulet body, and from the foregoing brief particulars it will be gathered that it forms a worthy companion to the 40-h.p. vehicle introduced by the same firm about a year ago.

Fig. 5.—Sectional Elevation of Gear Box.

THE R.A.C. has issued a certificate in connection with the petrol and benzol consumption test, made with a 40-h.p. six-cylinder Napier, on August 23rd and 24th last. For the petrol test Shell spirit was used, specific gravity 720. The total distance run was 200 miles, and the amount of spirit used was 10 gallons 3 oz., equal to 19.96 miles per gallon. For the second test Bowley's benzol was used, specific gravity over 730. The total distance run was again 200 miles, and the consumption was 10 gallons 3 pints, equal to 19.27 miles per gallon. For both

Fig. 6.—Cross Section of Gear Box.

the above tests the same route was followed, viz.:—From the 13th milestone to the 113th milestone from London, on the North Road, *via* Stevenage, Wansford and Grantham, and back over the same route. The weight of the car on both days was the same, viz., 3,226 lb., and there were four passengers carried. We may add that no adjustment or alteration was made to the carburettor for the benzol. Seeing that it was of much greater specific gravity than the petrol, the carburettor should obviously be slightly altered to obtain the best result, but even under the adverse conditions the trial was very satisfactory.

THE MONT VENTOUX HILL CLIMB.

A HILL-CLIMBING meeting was held last week end on Mont Ventoux (France) under the auspices of the Automobile Club Vaclusien. The course is 21.6 kilometres long, the gradient varying from 1 in 16 to 1 in 7. The starting point was at Bedoin, between which place and the finishing point there is a difference in altitude of 5,245 feet, or nearly a mile. The first day—Saturday—was devoted to the motor-cycles and light cars. M. Sizaire climbed the hill in 43 min. 27 3-5 sec. on his Sizaire-Naudin, making the best time in the 120 mm. single-cylinder class; in the category for single-cylinder (from 121 to 140 mm.), Giuppone on a Lion-Peugeot was first in 48 sec.; in the four-cylinder (71 to 80 mm.) section Lachannay on a De la Buire in 46 min. 38 2-5 sec.; in the four-cylinder (81 to 90 mm.) class, Belleville on a Brouhot in 35 min. 30 1-5 sec.; and in the four-cylinder (91 to 102 mm.) class, Souchal on a Brouhot in 29 min. 14 sec. The proceedings on Sunday were confined to the trials

CONTINENTAL NOTES.

The Provence Speed Trials.

Considerable interest was shown in the series of flying kilometre and five kilometre speed trials held by the Automobile Club de Provence on the level road between Salon and Arles on Thursday, the 12th inst. The honours of the day fell to Bablot, who, driving an A.C.F. Grand Prix Brasier racer, covered the flying kilometre in 23 4-5 sec., and the five kilometres in 1 min. 56 4-5 sec., the latter being equal to 96.3 miles per hour. Rougier, on a Lorraine-Dietrich, was second, his times being respectively 26 1-5 sec. and 2 min. 4 2-5 sec.; and Haeusslin, on a Rochet-Schneider, third in 32 1-5 sec. and 2 min. 38 2-5 sec. Two Sizaire-Naudins, a Prima and a Demeester competed in the class for single-cylinder cars up to 120 mm. bore, M. Sizaire proving the fastest—51 1-5 sec. for the kilometre and 4 min. 16 4-5 sec. for five kilometres. The category for four-cylinder vehicles between 103 mm. and 116 mm. bore resulted in a dead

The Provence Speed Trials.—Bablot on the Brasier Car on which he made the fastest time of the day.

of racing and high-power touring cars. The best time of the day was made by Rougier on a Grand Prix Lorraine-Dietrich, his time being 19 min. 30 2-5 sec., as against Bablot's (Brasier) 19 min. 59 2-5 sec. The record for the climb stands at 19 min. 13 sec., this having been set up by Cagno on a Fiat in 1905. The winners of the touring car sections were:—Class 5, four-cylinder engines, 103 to 116 mm. bore, Feuillet (Brouhot) 28 min. 4 3-5 sec.; Class 6, ditto, from 117 to 125 mm. bore, Marze (Cottin-Desgouttes) 25 min. 16 4-5 sec.; Class 6a, ditto, from 123 to 129 mm., Hamelle (Mors) 28 min. 22 sec.; Class 7, ditto, from 125 to 140 mm., Gaste (Radia) 25 min. 44 1-5 sec.; and Class 8, six-cylinder cars, from 40 to 60-h.p., Jenne (Rossel) 24 min. 54 4-5 sec.

heat between Kiss, on a De la Buire, and Barthelemy, on an Itala, both covering the kilometre in 39 4-5 sec. Kiss, however, proved the faster over the longer distance—3 min. 17 2-5 sec., as against 3 min. 41 3-5 sec.

The Semmering Hill Climb.

The annual hill-climbing competition from Schottwein up the Semmering, promoted by the Austrian Automobile Club, promises to be a big success, over a hundred entries having been received. The event is to be run off on Sunday next.

Motor Vehicles in the French Military Manœuvres.

The most important feature of the military manœuvres just completed in the Gironde district of France has been the experiment with motor instead of animal traction for the commissariat wagons. Bordeaux was fixed upon as the terminus point, and every morning a convoy of motor wagons left that city with bread, oats, sugar, coffee, tinned meat, &c. In eight or nine hours it covered the sixty odd miles separating it from the cantonment zone of the 18th Corps, returning to the starting point

THE Renard road train which has been on view at the Tropical Industries Exhibition at Liverpool this week arrived in the city on Friday week, after a journey from Coventry. Leaving the latter town at seven o'clock on Friday morning it arrived in Liverpool a few minutes after nine o'clock the same evening—a distance of about 112 miles.

next day. In this way two convoys of forty wagons were able to revictual the army corps. The experiment has been entirely successful, and has placed beyond doubt the immense advantage of mechanical traction for revictualing armies in the field.

The 1908 A.C.F. Grand Prix Race.

Two new circuits for the 1908 A.C.F. Grand Prix race have already been proposed. One, which measures 100 kilometres, is situated in Maine-et-Loire; there are no level crossings on it, and only five or six small villages are passed through. It is situated near Angers, the principal places on the route being St. Jean, Becon, Candé, Champtocé, and St. George's. The second circuit is situated between Bourges and Nevers; it is 71 kilometres long, and, except for the level crossings, is said to be an ideal course.

An Automobile Caravan.

M. A. de Fabregues, a member of the Marseilles Auto-

motor-vehicles.——A public motor-car service is being established between Memel and Libau, Russia.——The Conseil-General de Loire-Inferieure is open to receive offers for the establishment of a public motor-car service between Nantes and Berval, for which it has voted a subvention of £400.——Recently, when travelling upon her car from Biarritz to San Sebastian, the Queen of Spain experienced tyre troubles, and was unable to proceed until Senor Don Augusto Perogordo arrived upon the scene with his 28-h.p. Daimler car and supplied the necessary outer cover.——La Société le Taxauto Nantais has just been formed in Nantes to introduce a service of taximeter motor-cabs into the town. A start is being made with six 12-h.p. vehicles.——In order to stimulate interest in motor-cars some influential gentlemen in Norway have recently taken up the question of organising an automobile club.——Eleven motor-cars and seven lorries were used in connection with the recent manoeuvres in Switzerland.——Some trials with a new agricultural motor constructed by M. Gougis have lately been carried out near Auneau (Eure

The Six-wheel Car built for the Khedive of Egypt by the Lorraine-Dietrich Co.

mobile Club, has recently had constructed a motor caravan which will render him independent of hotels when touring in various parts of France. The vehicle, which is provided with a 35-40-h.p. petrol motor, comprises a dining saloon with a table for eight persons, the chairs being convertible to bedsteads, a lavatory, and a kitchen with cooking stove.

Motor-Car Regulations in Russia.

The Russian Ministry of Ways and Communications has drawn up a series of regulations with regard to motor-car traffic in Russia. All automobiles must be submitted to the authorities, who, after examination, will issue a certificate that the same are safe. The maximum speed permitted on the open roads is sixteen miles per hour, this being reduced in towns and villages to thirteen miles.

Miscellaneous Items.

Herr Scheibler, of Aix-la-Chapelle, has lately completed a double-deck motor-bus for service in Abyssinia.——A motor-car race from Odessa to Nicolaieff and back (Russia) is to be held on the 27th inst.——Tenders are about to be invited for the transport of the mails between Amiens and Doullens (Somme), France, by

et-Loire), France.——It is reported from Turin that the makers of the Rapid car have suspended operations owing to financial difficulties.

THE fleet of Brown cars which is used by the members of the Royal Commission on Congestion in Ireland has now completed over 13,000 miles without having given the slightest trouble.

AN American firm of motor-car builders is organising a competition for chauffeurs employed by motorists owning vehicles of their construction who do the best work and show the most common sense in 1908. That the records may be absolutely accurate in detail, each contestant will be required to have his report acknowledged by his employer, and sworn to before a notary public. The rules require that each competing chauffeur must drive for the same owner throughout the contest. The first prize is £200, the award being based on average cost of repairs per mile. Thus not only will drivers be encouraged to retain their positions but also to keep their repair bill down to a minimum by handling the car intelligently, keeping it constantly in good running condition, and especially in avoiding reckless driving.

SEVERAL members of the Gaelic League are on a motor-car tour through the Irish-speaking districts of Donegal.

THE tenders received by the London County Council for the supply of a motor-escape van to the fire brigade vary in amount from £860 to £1,300.

MANCHESTER is considering the adoption of motor vehicles for certain of its municipal officers.

A SMALL car at a cost of not more than £150 is to be purchased for the official use of the Motor Union.

FIFTY-THREE entries have so far been received for the reliability trials of voituettes and light cars which are to be held in France next month.

The 30-40-h.p. Fiat just supplied to the Duke of Rutland by Fiat Motors, Ltd. The vehicle is fitted with the Fiat special automatic starting device. Over the driver's seat is a substantial roof for the carriage of heavy luggage, while the interior of the body, which may be opened or closed at will, is a fine example of comfort and adaptation to practical requirements.

THE Union Motor Car Company, 21, Denbigh Street, Victoria, S.W., have secured the British agency for a new Italian car—the S.M.B., made by the Societa Meccanica Bresciana. The first chassis is expected to arrive very shortly.

At the Brussels Aeronautic Conference, the Aero Club of Great Britain has been represented by Prof. Huntingdon, Messrs. Roger Wallace, K.C., the Hon. C. S. Rolls, Griffith Brewer, F. H. Butler, and H. E. Perrin. Next year's gathering may take place in London.

THE Car Supply Company, Ltd., have opened showrooms at 34, Knightsbridge, W., next door to the Ladies' Park Club, where they are exhibiting examples of cars made by the Maison Duhanot of Paris, for whom they are the British sole agents. A stock of motor accessories is also being kept on hand.

WITH the sanction of the Indian Government, the Motor Union of Western India has decided to hold Reliability Trials on December 26th, 27th, 28th, and 29th. The test will be over a distance of about 600 miles, from Bombay to Kohlapore and back, via Mahabaleshwar, the last day's run being 185 miles long.

DAMAGE to the extent of £50 has been done to a motor lorry near Reading under peculiar circumstances. A motor-car got into difficulties, and a lorry belonging to Messrs. Durham, Churchill and Co. went to its assistance, and itself became disabled. The lorry was left by the roadside all night unattended and with no light. A gentleman, seeing that it was a source of danger to traffic, tied a bull's-eye lantern to the lorry with a string. The cord burnt through, the lamp fell on the lorry, setting it on fire, and causing the damage mentioned.

HERE AND THERE.

THE annual dinner of the Motor Union has been fixed for November 13th.

THE latest departure of the Vanguard Motor Bus Co., Ltd., is the undertaking of goods

transport under contract, and they have already undertaken such work for Messrs. Barclay, brewers.

IN the London Road, Hatfield, Mr. J. Gray has provided a garage with accommodation for fifty motor vehicles.

AN inspection pit is a feature of the garage which is owned by Messrs. Passey and Hill, Ltd., at Ross, in Herefordshire.

MR. R. W. F. CECIL, son of the late Lord Francis Cecil, has just ordered a 26-30-h.p. limousine from Messrs. J. B. Ferguson, Ltd., Belfast.

WE learn that two motor-cars have been sent out to Mombassa for the use of Mr. Winston Churchill in his forthcoming tour through Central Africa.

MESSRS. ARGYLLS (LIVERPOOL), LIMITED, have secured a trial order from the proprietors of the "Liverpool Echo" for a 10-12-h.p. Argyll newspaper delivery van, similar to those supplied to the "Glasgow Evening News."

SERGEANT BAKER was charged at Folkestone with perjury, it being alleged that he gave false evidence in a prosecution which he, as traffic inspector, brought recently against a motor-car driver, whom he summoned for loitering, to the general satisfaction of the townspeople. Baker was discharged without any evidence on his behalf being offered.

A DELIVERY van that is creating a great deal of interest in the Commercial Vehicle Trials is that of the Palmer Tyre, Ltd. As will be seen from the accompanying illustration, the body—built by Messrs. Bayleys, Ltd., of Newington Causeway, S.E.—has been specially designed to represent a section of the well-known ribbed-tread Palmer Cord tyre, and is of a decidedly unique construction. The Palmer Tyre, Ltd., have received so many inquiries from motor-van builders and users regarding the possibility of using pneumatic tyres for delivery vans, that they have decided to avail themselves of the opportunity to demonstrate the capabilities of Palmer Cords for work of this description. The van has been designed for a load of 15 cwt., but a specially strong back axle and rear springs have been fitted for the trials, during which the vehicle is carrying a load of one ton. The Palmer Tyre, Ltd., are confident that their 5-inch

tyres will be capable of dealing with the additional load without the slightest trouble. Beyond the special and original type of body, the van does not differ from the standard 15 cwt. Thames delivery van chassis supplied by W. T. Clifford Earp, Ltd. At the conclusion of the trials the van will be utilised by the Palmer Company for ordinary delivery requirements.

IN Stanley Place, Chorley, the Chorley Motor Company have opened a garage.

AT Ross, Herefordshire, Messrs. C. and W. Butcher have a motor garage with repair works.

WE illustrate herewith the latest model of the Duco portable turntable introduced by Messrs. Brown Bros., Ltd. This simple and ingenious device is made of iron throughout, and so substantially constructed that the heaviest motor-car can be moved about on a pair of them, and so easy is their movement that one man can turn a vehicle in any direction. For the handling of

cars at close quarters these turntables are especially useful, and for use in garages they save tyres, time, and labour, while facilitating the cleaning and washing operations. They work equally well under either the two front or two rear wheels, and by using four it is possible to turn a car completely round in its own length.

THE motor fire-engine belonging to Finchley has broken down on several occasions recently.

"THAT'S a life-belt," remarked an urchin in the Strand one day last week as a taximeter cab passed with its Stepney wheel attached.

MESSRS. REYNOLDS AND PODMORE, of Stockport, near Manchester, are making a speciality of coach-built bodies for motor-cars.

SPEAKING at Tiverton Town Council, Mr. T. Lake said he looked upon motor-cars as "The Devil's Own Team." They made the country intolerable.

THE motor garage of Messrs. Evan Jones and Son, at Carnarvon, is in Castle Square. The firm have also a depot in Bangor Street, in the same town.

THE Lancashire Steam Motor Co., Ltd., Leyland, have lately completed an 18-seated single-deck petrol motor-bus for the Metropolitan Asylums Board.

MESSRS. DURHAM, CHURCHILL AND CO., Grimesthorpe Sheffield, are building a 15-cwt. delivery van to the order of the Sheffield Corporation for the collection and distribution of money and tickets in connection with the electric tramways.

To the end of July last the exports of motor-cars and parts from the United States this year have attained a value of £849,098, as compared with £593,857 in the corresponding period of 1906. England heads the list with £267,034, Canada being second with £180,077.

THE Sculcoates (Yorkshire) Rural District Council have decided to apply to the Local Government Board for the necessary powers to deal with motor-cars, it having been brought to their knowledge that there was a possibility of motor-buses being run between certain villages within the area of the county.

IN connection with the recent visit of the American Assistant Postmaster-General to Cork, Messrs. Argylls Ireland, Ltd., supplied the Cork Harbour Board with a 16-20-h.p. Argyll car, in which the distinguished visitor, accompanied by the High Sheriff of Cork and Mr. James Long, J.P., chairman of the Harbour Board, drove to Blarney, via Carrigrohane, where they inspected the castle.

THE question is often asked, Does Brooklands assist the motor trade? The proprietors of the "Motor House" are of the opinion that it does. While not finding any decrease in the demand for the fastest cars, they say that the track has been of considerable service to them in regard to some of the older, though fairly powerful, cars. Many people will not believe that some of the cars of two or three years ago are anything like as fast as the more modern cars. But when they take them round Brooklands against the clock and the wind, they will, probably, discover their error in judgment and, in nine cases out of ten, complete the bargain.

MR. D. C. CRUIKSHANK has opened a motor garage at 29, Diamond Street, Aberdeen.

"THE MAID AND THE MOTOR-MAN" is being performed at the Gaiety Theatre, Manchester, with a "gentleman chauffeur" as a leading character.

PARAFFIN should never be used in any way whatever for washing motor tyres. Covers are best and most safely cleaned with a sponge and the smallest possible quantity of clean water.

THE Sheffield motor char-a-banc accident has resulted in another death, a young woman named Edith Slack succumbing to her injuries on Monday. This is the fourth death as a result of the accident.

MR. ARNOLD HERBERT, M.P., has suggested to the President of the Board of Agriculture that a large part of the increasing cost of maintaining the roads should be thrown upon the national exchequer.

SIR HERBERT JEKYLL, the head of the new Traffic Department for London, was motoring recently at a speed that he estimated at twenty miles an hour. Accepting police evidence, however, a fine of £5 on his chauffeur was imposed by the magistrates at Kingston.

MESSRS. GUTTERIDGE AND ZAMBRA, LTD., of 308, Euston Road, N.W., have opened a motor repair works at 108, Drummond Street, Hampstead Road, N.W. Garage accommodation is provided for fifteen cars, and general repair work will be carried out, the establishment being well equipped for that purpose.

FOUR Dundee firms—Thomas Shaw, Limited; the Rossleigh Cycle and Motor Company, Limited; the Dundee Motor and Cycle Company, Limited; and Mr. F. W. Raikes Bell—are being asked to quote for a suitable motor-car to be used by Mr. George Baxter, water engineer, Dundee, for his official duties.

MANY of the large market gardeners in Middlesex now convey their produce to Covent Garden Market, London, by means of steam tractors and trailers. Among them is Mr. A. W. Smith, of Feltham, whose Wallis and Steevens' tractor, hauling two trailers piled high with fruit baskets, is a regular feature of West End traffic.

THE motor lifeboat, which is intended to serve Teesmouth and Hartlepool Bay, is now about to leave the builders' hands. She will be the only motor lifeboat on the North-east Coast, and will be the third to be brought into use in the country by the National Lifeboat Institution. She will be taken to her destination by Mr. W. Gales, of the firm of Messrs. Robinson and Co., motor engineers, West Hartlepool, who will be accompanied by half-a-dozen of the Seaton Carew lifeboatmen.

WHILE motorists naturally pay full regard to the appearance and fitments on their motor-cars, the smaller matters are often overlooked. Especially is this the case with regard to such

things as goggles, in connection with which attention might well be paid to the fitting as well as the appearance. The use of ill-ventilated and badly-constructed devices of this kind quickly injures the eyes. Recognising this fact, Messrs. Aitchison and Co. have brought out a "collapsible cup" motor goggle, which obviates many of the

dangers connected with the use of the cheaper varieties that are on the market. Mr. Aitchison is a well-known optician and authority on the eyesight, and, while paying full regard to scientific construction, has provided a speciality that fits without pressure on the face, affording comfortable and easy wear. The goggles are well ventilated, and fitted with special lens. The flexibility of the cup form secures safety, as the spring fronts, if forced to the face by a blow, collapse at once, so that the force is projected from the face without injury. The Aitchison motor goggle may be obtained from the firm at 14, Newgate Street, E.C., or any of the London branches of the firm, as well as from their Yorkshire establishment at 37, Bond Street, Leeds.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

RACING AT BROOKLANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It will be remembered that the promoters of the Brooklands Automobile Racing Club, when asking for the support and patronage of the principal motor manufacturers and the sporting public, did so upon the grounds that the Brooklands course would give every manufacturer an opportunity of testing the capacity of his cars, and that the public would be certain that the administration of these races would be without partiality. I venture to think that these promises in actual practice have been, unfortunately, very slightly adhered to, and that a complete open system of competitions cannot and does not take place at these races.

The real cause of this unfortunate state of affairs seems to be the desire on the part of the powers that be to arrange or strain the regulations so that the British manufacturer shall have a decided preference over his foreign rival. The proof of this statement is exemplified in the regulations made by the club for entries of cars whose cylinder capacity has been limited to 126 mm. (about 5 inches). Now these are the

I have noticed that after passing the finishing line some competitors drive to the right with the view of turning round to the left, and that others do just the opposite, with the result that either collisions are inevitable, or that in endeavouring to avoid the same something equally bad may happen. I think it would be wise if the officials were to issue instructions that no stopping and turning round will be permitted, but that the cars must continue—at a slower pace naturally—right round the track. This would only occupy a few minutes longer than at present and would, I am sure, tend to greater safety.—Yours truly,

A SPECTATOR.

IS IT POSSIBLE TO ELIMINATE THE CHANGE SPEED GEAR?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The question whether it is possible to eliminate the change-speed gear in petrol cars is one that has been raised at intervals ever

The Cardiff Automobile Club's Hill Climbing Competition.—Mr. G. Stevens on his Royal Starling Car taking the first bend.

dimensions of most of the British-built cars, but the principal foreign makers standardise their cylinders of this type at 130 mm., and this difference of 4 mm. prevents many cars such as the following from being entered in this class, and of course it would be worse than useless for them to enter in the next class, where the cylinder dimension is 155 mm.

35-45-h.p. Renault	130 mm.	40-h.p. Rapid	130 mm.
40-h.p. De Dietrich	130 mm.	28-40-h.p. Züst	130 mm.
40-h.p. Itala	130 mm.	30-h.p. Daimler	130 mm.
28-h.p. Peugeot	130 mm.	30-h.p. Spyker	130 mm.
40-h.p. S.P.A.	130 mm.	40-h.p. Junior	130 mm.
40-h.p. Weigel	130 mm.	40-h.p. Nordenfelt	130 mm.

and many others.

If these regulations stand, the foreign maker must build a special engine, and therefore the cars they enter in these races will not be similar to those sold to the public.—Yours truly,

FAIR PLAY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is a curious fact that all the accidents that have so far taken place on the Brooklands Track have occurred after the race was over—in the pulling up operation. As one who has attended most of the meetings

since the internal combustion motor was first adopted as a source of power for automobiles, and there appears to be very little doubt that it will continue as a thorn in the side of the motor engineer for a long while to come. Much has been done, it is true, but, in a certain sense, what has been accomplished has actually tended to leave matters further from the realisation of this ideal than was the case at the outset. The necessities of the situation have been appreciated, and a practical change-speed gear developed from extremely crude beginnings; during the same period the motor itself has undergone a marvellous amount of improvement, but this has stopped far short of the culmination desired, and its shortcomings still loom up as large as ever. There are occasional outbreaks on the part of various enterprising firms in organising top speed runs to show the motor world in general that the change-speed gear is no longer an absolute necessity—it is merely an emergency reserve and a friend in need for the inexperienced driver. But the majority of manufacturers still continue to put a three or four speed gear-box on their cars. Such performances as those referred to show what can be done by a skilful driver with a clear road, but forcing a motor of the present type until it is ready to gasp its last will not benefit it nor bring the sought-for result any nearer. Cylinder multiplication has appeared to offer a quasi remedy for the evil, and so far as the use of the six-cylinder motor has made it possible to do a much greater

proportion of the driving on the high-gear, it may be said to have accomplished the object in view, but considered as a whole the problem remains practically unaltered. It is quite evident that the inability to start under load is one of the principal drawbacks of the internal combustion motor, and, viewed at the present stage of development, it appears likely that the need of an intermediate step between the engine and its load constitutes a shortcoming that falls in the same category in any such exacting and variable service as that called for by motor-vehicles.—Yours truly,

A. T. MILLINGTON.

THE A.C.F. GRAND PRIX RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to my letter of August 31st, to which Mr. Weigel has been good enough to reply, I do not think it can in any way be so construed as to imply that I am the only driver. I simply made a statement, thereby showing that if I want to be successful I must rely upon my own ability, that my ambition is racing, and that ambition is fanned by the remarks of people I have driven. At all events, please exonerate me from any thought of pride or presumption to real racing ability; whatever I do I must do for my living, and I know that I could do more if I only had the opportunities.

Mr. Weigel has placed the thin edge of the wedge in sight for me, i.e., I must get employment with a firm who build racing-cars; now

A six-cylinder San Giorgio car (an Italian Napier) being tested up the Grand St. Bernard, a very severe road. At the helm is Mr. Bruce Ball, technical director of the San Giorgio Company. The car depicted was driven from the works without previous trials, and completed a run of 475 miles with one stop to adjust a fan belt.

who will first satisfy themselves as to the probability of my being a remunerative acquisition to their workshops and then employ me. I would give up my business, motor dealing, and start at once where there was a chance of—as Mr. Weigel so nicely puts it—being welcomed at some future date as a successful racing debutant. At all events, he does not advise me, so far, to give up the idea.—Yours truly,

H. J. CHAPMAN.

A STEAM CAR ENTHUSIAST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR—Why is there so much prejudice about steam cars? There is hardly any correspondence about them, and none of that mechanical analysis that appears with regard to petrol cars. The following may be of interest to those who neither express their views nor cry their wares. I sold to a gentleman a 10-h.p. White steam car, second-hand, and three years old. The sale occurred on the evening of the 9th inst. in London, and on the following day I drove the buyer home to Grimsby, where we arrived in time, for tea. Not wonderful; no, but just read the description of the car again and add to that a heavy limousine top, tools, spares, petrol, parcels, and two passengers as well as myself. We did not have the slightest trouble; the ride was delightful and the purchaser delighted with his bargain. We only stopped a few times for water and then glided off immediately. No starting handle, gears, or

clutch to worry about, and the smooth, noiseless, easy running was a revelation to the owner. The buoyant athletic movement is a real luxury which can only be acquired in a petrol car costing four times the price of the steamer. There is no doubt that some of the early types of these cars poisoned the minds of people who still retain the fear of sitting on a boiler and watching the water level.—Yours truly,

H. J. C.

LOSS OF COMPRESSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would you please give me a little advice on the following? I have a 10-12-h.p. Aster engine which goes fairly well, but the compression in one cylinder is not so good as in the other. I have had new valves fitted complete (inlet and exhaust) and had them very well ground in. I have also had new piston rings put in, but still this is of no avail, the compression being still as bad as ever. I may say that the following strikes me as being peculiar. I always find a certain amount of oil floating on the water in the water tank. How does it get there? Do you think there is a leak inside the cylinder head, thus allowing escape of compression, and also a little oil into the water jacket?—Yours truly,

W. P. LOFT.

[The oil that is found in the water tank may come from the lubricator of the circulating pump. If there is a hole in the combustion chamber that lets the compression escape into the water jacket, it is probable that water from the jacket will be drawn into the cylinder during the suction stroke, and if this is the case, there would likely be trouble in starting up, and on opening the compression tap when running there would be steam ejected. The way to test the matter is to take down the suspected cylinder and turn it upside down. Then couple the water jacket to a supply of water under pressure; the house supply if from the main direct will be sufficient, otherwise a force pump must be obtained. If there is a leak, a glance into the bottom of the cylinder will reveal it. Whilst the cylinder is down for examination the crown of the piston should also be inspected, as this may have a blow-hole or be porous. If, when these tests have been carefully made, the cause is not discovered, it will be necessary to suspect that the work of fitting new valves and rings has not been done properly. Has the cylinder been tested as to being dead true in bore, or is it scored at all?]

MOTOR-CARS AND PATRIOTISM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The writer of an article on "The Army and the Motor-car," in the current issue of a service journal, states that many officers in the army are adopting the motor-car as the most convenient and expeditious means of transit in the discharge of many important military and social duties. He also mentions the fact that they largely patronise an all-British made car. This is as it should be. In a contemporary I read a report of an American's tour round the world on a British motor-car. If a London-made car can establish such a wonderful record, does it not seem wholly unnecessary and unpatriotic to spend good British money, as is done in many cases, on imported foreign-made cars, none of which are in any way superior to or as good as the British article?—Yours truly,

H. F. TRIPPEL.

Major, Army Motor Reserve.

TYRE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was interested in Mr. Will Bishop's letter *re* tyre troubles, inasmuch as I have been experiencing the same kind of difficulty. My car is a 7-h.p. four-seater. I began the season with plain Dunlop tyres, 750-85, but owing to the greasy state of the roads, caused by much rain, and also by water-carts, had to have recourse to some kind of non-skid. I was advised to have non-skid bands vulcanised on the two back covers. A fortnight after I received them—during which time I had had no tyre trouble whatever—the near hind tyre burst with a loud bang, one afternoon when I was visiting a patient in the country, after I had been running ten miles at a pretty smart pace. I found about an inch of the edge of the outer cover lifted out of the rim of the wheel, and the inner tube projecting and a hole in it, the length of my hand. A week later the same thing happened, but this time more of the edge of the outer cover came out of the rim. It then got to be an almost daily occurrence, actually happening three times in one day. I decided to use my spare Dunlop cover which had no non-skid on. Then next day, after I had driven about two miles, the off-side hind tyre suddenly went down; I immediately jacked up the car, and found the inner tube very hot: I felt the studs and could hardly bear my bare hand on them, whilst the leather band of the non-skid was absolutely at atmospheric temperature. I put in new inner tubes on both wheels and once more resorted to the non-skid bands. My motor agent suggested that I had nipped the tubes with the dogs, or the beaded edge of outer cover. Three times I have allowed them to fix the tubes themselves, blow them up and test with gauge, but it still happened. The last time I had a brand new tube put in, properly blown up by them, and had gone two miles to visit

a patient, and, whilst in the house, heard a report like a cannon. On coming out, I discovered about nine inches of the edge of outer cover out of the rim, and a slit in the tube into which I could easily get my hand. I took the tube out and found it quite hot, the studs on the non-skid very warm, but the leather, being a non-conductor of heat, as usual, cold. I take it that there is great friction between metal studs and the ground, causing the metal to become very hot, but, as the leather is a non-conductor of heat, most of the heat finds its way to the lining of the outer cover and so to the inner tube, which when the tyre is inflated is practically part of the inner surface of the outer cover. As a medical man I should be glad to hear further on the subject, as such frequent occurrences as burst tyres is a matter of very grave importance.—Yours truly,

GALLEN.

FAST MOTORING IN LINCOLNSHIRE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am requested by the Committee of the Lincolnshire A.C. to enlist the kind offices of the Press in a very urgent matter. For some time complaints have reached us from all parts of the county, but more especially from the south-western portion, where the main roads to and from the north pass through the county of Lincolnshire, as to the reckless driving of motorists and as to the damage caused to the roads by heavy cars being driven at a high speed.

Our relations to the authorities and with the police, which have hitherto been so cordial, are in danger of assuming another aspect, and we have received information that very strict measures will shortly be taken unless greater moderation is observed.

This club is entirely sympathetic with the authorities in this matter, and my committee has decided to assist the police in every possible way to check what has undoubtedly become a public danger and a nuisance.

It is more especially in connection with fast driving through villages and at cross roads that complaints arise, and motorists are earnestly requested to observe the utmost caution in this respect. My committee feels that the attention of motorists has only to be called to the matter for an improvement to occur.—Yours truly,

GODFREY LOWE,
Hon. Secretary Lincolnshire A.C.

THE CONTROL OF THE ROADS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a casual reader of the A.A. and M.U. controversy, it seems to me that the position taken up by the former is childish. Even if the badge idea did originate from the A.A., why on earth should not the M.U. adopt one? Assuming Oxford first thought it expedient for her representative athletes to wear dark blue, did she turn up her eyes and ask the vengeance of the gods when Cambridge adopted light blue for the same purpose? Of course not; she, I have no doubt, welcomed the distinguishing mark.

Then the scout and road agent ideas—the latter neither infringes nor duplicates the work of the former, and while the former aids scorching and incidentally the dislike of the public to motorists, the latter is intended to ensure considerate driving and to popularise motoring. However the quarrel may end, the ordinary motorist is distinctly the gainer now, and, like myself, probably believes that competition is good for the public, and that the A.A. has seized an excellent opportunity to advertise itself.—Yours truly,

A. C. THOMPSON.

CAUSE OF WATER BOILING.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 20-h.p. four-cylinder car which has not caused any trouble until recently, when the water in the radiator commenced to boil so badly as to force its way out through the filling plug when the latter is screwed down tight and the vent pipe is open. The engine is getting enough oil.—Yours truly,

RIPLEY.

[The trouble is apparently due to a failure in the circulation. We would advise a careful examination of the pump; if this should be in order, follow on through the connections, radiator, &c. The cylinders being foul or too rich a mixture will also cause the water to boil.]

SULPHATED ACCUMULATORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or any of the readers of the *M.C.J.* could advise me what to do in the following difficulty. One of my accumulators has unfortunately, owing to neglect, become rather badly sulphated, and it is not possible to get it charged. I may add that I am able to charge the cells from a 100-volt electric lighting circuit.—Yours truly,

W. JAMIESON.

[The remedy for sulphation in an accumulator is charging for a very long period at a low charging rate. If possible, the acid should

be emptied out and weak acid of 1.050 specific gravity substituted, but if this is not easily done it is not an absolute necessity. The accumulator should then be charged at half its normal rate for a long period of time. The sulphate will then be gradually reduced, or that part of it which is too hard to be acted upon will be driven off by the gas bubbles when "gassing" begins to take place. Some authorities recommend the addition of a little soda (sodium hydrate) to assist the action, but practical users have found that it makes very little difference. As the charging can be done from a 100-volt circuit, it will be no trouble to arrange for a low current, one 16-c.p. lamp being put in circuit for every 4 amperes required. Change to ordinary acid after the sulphate has been removed.]

THE NEW ROUTE TO IRELAND.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having noticed that the Royal A.C. has been asked to advise its members not to take their cars to Ireland by the Fishguard route or *vice versa*, which means missing touring through Pembrokeshire—one of the most picturesque counties in Wales—I have made a special point of going to Fishguard to inspect the facilities afforded by the Great Western Railway Company for the embarkation and disembarkation of cars by the new route, and find that motor-cars can and have been dealt with satisfactorily at Fishguard, where the cars have every attention. The remarks which have been made are unfair to the new

The Germain Car on Tour.

The Germain cars which ran in the A.C.F. Grand Prix Race in July last were ordinary touring cars fitted with racing bodies. Captain Masul had one of the vehicles fitted with a two-seated touring body, and has just completed a three thousand mile tour in the Vosges, Savoy, and Dauphine, touching Aix-les-Bains, Chambéry, Grenoble, Briançon, climbing the steep roads of Mont Cenis, the Little St. Gothard, &c. The road from Grenoble to the Col du Lautaret, where the photo reproduced above was taken, has an ascent averaging one in ten, and this was covered at an average speed of 43 miles per hour, notwithstanding the sharp turns and difficult passages thereon.

Rosslare route and prejudicial to the interests of motorists wishing to avail themselves of the facilities afforded by the railway company for the conveyance of motor-cars to and from Ireland, for it was apparent to me during my tour of inspection at Fishguard that the arrangements were such as to ensure cars being expeditiously and carefully dealt with. Special fitted trays are provided on which cars are run prior to their being lifted on or from the turbine steamers by the electric cranes, and cars arriving by road at Fishguard too early for immediate shipment are accommodated on the platform under a verandah at the station in close proximity to the steamer berths.

These are the principal features which appealed to me during my personal enquiries and observations, and I am satisfied motorists have nothing to fear from want of attention, as my experience is that much care is taken to satisfy motorists, the railway company showing that they are anxious to cater for motor traffic.—Yours truly,

GEORGE ACE.

CAPTAIN BERESFORD, of Flemmington, Gollanfield, Inverness-shire, has picked up near Gollanfield station a number plate B. A. 211, which the owner can have on application.

CLUBS AND ASSOCIATIONS.

THE MOTOR UNION.

In connection with the meet of the Motor Union at Leicester on Saturday last, a gymkhana was held in aid of the local Guild of the Crippled.

The officials were:—Judges, Mr. Rose, M.P., and Mr. E. G. Mawbey; starters, Mr. Rees Jeffreys and Capt. Byron; timekeepers, Messrs. F. K. Ward and S. C. Winks; hon. secretary, Mr. A. McAlpin. The results were:—

Glass of Water Race.—1st, Major Cole (30-h.p. Humber); 2nd, Mr. J. A. Harper (15-h.p. Humber).

Lady Passenger Race.—1st, Mr. J. A. Doran (24-h.p. Minerva); 2nd, Mr. J. A. Harper (30-h.p. Beeston Humber).

Tilting at Rings.—1st, Mr. A. Cayley (10-12-h.p. Humber); 2nd, Mr. A. E. Gould (15-h.p. Humber).

Adam and Eve Race.—1st, Mr. A. Cayley (10-12-h.p. Humber); 2nd, Mr. J. A. Harper (30-h.p. Beeston Humber).

Musical Chairs.—1st, Mrs. E. A. Riley (20-h.p. Belsize); 2nd, Mr. J. A. Doran (24-h.p. Minerva).

The prizes were distributed by Lady Marshall.

During August 700 new members were enrolled in the Motor Union, making an aggregate total membership of over 19,000. 320 Motor Union badges were issued during the month.

The Motor Union is issuing a list of rules and courtesies of the road, which it has compiled for the guidance of all users of the highway. Neglect of the amenities of the road is often due to ignorance,

It was decided that a sub-committee be appointed to report on the existing caution notices throughout the county, and to draw attention to those positions in which they consider caution notices are necessary, also that a letter be sent to the Motor Union to this effect.

The Secretary reported that his attention had been drawn to a very dangerous corner on the Oundle and Peterborough road near Warmington, by Mr. John Crisp. It was resolved that a letter giving full information be sent to the Clerk of the County Council, and that Mr. Crisp be informed of the action taken.

CARDIFF.

The officials of the Cardiff Motor Club are to be congratulated upon their successful competition held on Wednesday of last week, at Tynygrwr Hill, Caerphilly. This venue is some half-dozen miles from the Welsh metropolis, and the occasion attracted not only a good entry of motorists but a large attendance of interested spectators. The length of the measured portion of the hill up which the climb took place was 3,582 ft., with a total rise of 387 ft., the average gradient being 1 in 8.6 with 1 in 6.2 at the steepest part. The hill was admirably chosen for the purpose of the trial, the bends therein being a good test of the drivers. The handicaps were arranged according to the R.A.C. formula, and the officials were:—Judge, Mr. C. J. Thistle; clerks of the course, Messrs. J. W. Courtis, F. C. Shackel, and T. Butt Ekins; marshal, Mr. Albert Williams; secretaries, Messrs. H. B. Jotham and S. Hill; clerk of the scales, Mr. W. Wood; timekeepers, Messrs. F. Straight and A. C. Reynolds; starter, Mr. F. Straight; handicappers, Messrs. H. Hadden and E. Owen.

The Motor Union Meet at Leicester.—Some of the Members' Cars at the Gymkhana.

and the Union, desiring that the rules shall be as complete as possible, is inviting suggestions on the subject.

WEST ESSEX.

The competition for the 1907 challenge trophy was held on the 8th inst., but the results have not yet been passed by the competitions sub-committee, and will be published later. The next competition is for the club challenge cup, and will be held on the 22nd inst. It will take the form of a 100 miles reliability run, confined to motor-cycles, tri-cars, side cars, trailers, or quad-cars. The course will be from the Artichoke Hotel, Shenfield Common, thence to Billericay, through Stock to Widford, and back to the Green Dragon by main road (about one mile on the Chelmsford side of Brentwood), a distance of fifty miles, such course to be covered twice.

NORTHAMPTONSHIRE.

A MEETING of the committee of the Northants A.C. has been held at the George Hotel at Northampton. There were present: Mr. Alfred Webb (in the chair), Dr. A. A. Hope, Dr. Lewis, Mr. C. Phipps, Mr. J. C. Hipwell, Mr. Sidney F. Harris (hon. sec.), and Mr. J. F. Stops (hon. solicitor).—Mr. Arnold Wicksteed reported that he was obstructed by a carrier's cart on the Kettering road on August 24th, and although he sounded his horn continuously, the carrier would not let him pass for some considerable time. He also said that Mr. Nicholls was also prevented from passing on the same day by the same carrier, and Mr. Webb said he had had a similar experience the following week. After full discussion it was resolved that the hon. solicitor, Mr. F. J. Stops, be instructed to prosecute for the three obstructions, the committee feeling that the rights of members must be protected.

The results were as follows:—

In motor-cycles the gold medal for single-cylinder machines not exceeding 85 mm. by 85 mm. was won by R. M. Brice (3½-h.p. Brown), and the silver medal by W. Pollard (3½-h.p. Quadrant). In the class for multi-cylinder machines, O. L. Sammers (5-h.p. Vindec Special) won the gold medal and J. C. Moore (5-h.p. Rex) the silver medal.

In cars the successes of the Talbot cars were an outstanding feature of the day, as will be seen from a perusal of the following results, the figures following the name of the cars being the figures of merit:—

Class I., for cars whose cylinders D²N are under 35—nine entries: 1, C. J. Newey, 10-h.p. De Dion, 76.95; 2, R. E. Leigh-Jones, 8-h.p. De Dion, 76.23; 3, V. Riley, 12-h.p. Riley, 72.09.

Class II., between 35 and 50 rating—four entries: 1, G. Dav, 12-16-h.p. Talbot, 83.44; 2, J. H. England, 12-16-h.p. Talbot, 73.64; 3, W. Biscombe, 12-16-h.p. Talbot, 64.92.

Class III., between 50 and 65 rating—ten entries: 1, C. R. Garrard, 15-h.p. Talbot, 97.95; 2, F. H. Woollen, 15-h.p. Talbot, 76.68; 3, W. Stokes, 20-h.p. Talbot, 74.708.

Class IV., between 65 and 90 rating—thirteen entries: 1, Viscount Ingestre, 15-20-h.p. Talbot, 84.41; 2, G. F. Heath, 24-h.p. Minerva, 78.27; 3, P. Graham, 24-h.p. Deasy, 74.89.

Class V., between 90 and 150 rating—1, E. W. Lewis, 35-h.p. Deasy, 64.64; 2, W. Parker Thomas, 35-h.p. Daimler, 64.26; 3, H. Hollingdrake, 35-h.p. Buire, 63.32; 4, N. Parish, 40 h.p. Buire, 61.38; 5, Capt. D. Hughes Morgan, 45-h.p. Daimler, 58.67; 6, P. Lewis, 35 h.p. Ariel-Simplex, 57.29; 7, Gibbon Brooks, 40-h.p. Weigel; 8, S. Smith, 60-h.p. Napier; 9, E. A. Bowden, 35-h.p. Iris; 10, R. Cory, 50-h.p. Darracq.

The first in each class was awarded a gold, the second a silver, and the third a bronze medal. The winner of the silver cup for the best

figure of merit was Mr. T. H. Woollen, whose 15-h.p. Talbot was second in Class III. The 60-h.p. Napier in Class V. did fastest time, but, at the dinner that followed, Mr. Parker Thomas announced that Mr. Edge having surrendered the silver cup to the second car—the 35-h.p. Daimler—he (Mr. Thomas) as the holder would be glad to offer it to the club for competition again next year under similar conditions.

CHESHIRE.

ON Saturday, under the auspices of the Cheshire A.C., a motor gymkhana was held on the show ground of the Wirral Agricultural Society at Bebington. There were thirty-five contestants in five events, which resulted as follows:—Appearance competition, Mr. A. L. Rea (30-h.p. Delaunay Belleville) took first prize, and Mr. D. T. Brown (70-h.p. Mercedes) second prize in Section A; and Mr. J. A. Stephens (45-h.p. De Dion) first prize, and Mr. W. Gerald Barker (40-h.p. Napier) the second prize in Section B. The Tortoise race was won by Dr. A. J. Wallace (16-20-h.p. Sunbeam), Mr. A. E. Crowdy (Siddeley) being second. Mr. Crowdy also won the Victoria Cross race, in which Captain Alkin (16-h.p. Star) was second. Dr. S. Wilkinson (9-10-h.p. Cadillac) won the Police Trap race and Mr. J. L. Smith (16-20-h.p. Clement-Talbot) was second. The Bomb race fell to Mr. A. G. Jeans (24-h.p. De Dion), with Mr. J. H. Temple (22-h.p. Berliet) second.

At the close of the competitions the prizes were distributed by Miss King (Oxton), to whom a vote of thanks was afterwards tendered, on the initiative of Mr. A. G. Jeans, seconded by Sir Percy E. Bates, Bart.

The success of the gymkhana was mainly due to the energy of the honorary secretary (Mr. J. A. Hassall) and of the hon. treasurer (Mr. William Jackson), who had the co-operation of Dr. Wilkinson, Mr. J. A. Stephens, Sir Percy Bates, and Dr. Stevenson. Mr. James Moon acted as starter, Mr. J. Arnitt Dear as marshal, and Mr. D. T. Brown, Mr. W. Hind, and Mr. L. Stevenson as judges.

NORTH WALES.

WITH the exception of a brief shower of rain, fine weather favoured the motor gymkhana promoted by the North Wales Automobile Club, held on Gwydyr Castle Park, Llanrwst. Competing cars were divided into two classes—those of over 9 ft. wheel base and those not over 9 ft. wheel base. In the former class were entered Mr. A. E. Crowdy (30-h.p. Siddeley), Mr. A. C. Davies (35-h.p. Daimler) and Mr. Phil. D. Lee (18-h.p. Siddeley); while in the latter class were Mr. J. E. Alkin (16-h.p. Star), Mr. W. H. Buxton (14-h.p. Germain), the Rev. F. P. Watkin Davies (12-h.p. Unic), Mr. E. O. Watkin Davies (18-h.p. Germain), Miss Gwladys Davies (5-h.p. Oldsmobile), Dr. H. Grey Edwards (10-12-h.p. Humber), Mr. R. Norton (8-h.p. Rover), Col. S. Sandbach (6-h.p. Siddeley), Mr. H. D. D. Walthall (24-h.p. Germain). At the conclusion of the events prizes were distributed by Lady M'Laren, of Bodnart.

ON Saturday the South Devon A. C. held a successful meet at Ashburton.

CASES UNDER THE MOTOR CAR ACT.

DAINGEROUS DRIVING.

Lord Vernon was, at Stockport, fined £10 and costs and his licence endorsed for driving his motor-car through the streets of Stockport at an excessive speed. The deputy town clerk said the defendant was travelling at the rate of nearly forty miles an hour through streets which were filled with people, and he frightened many of them out of their wits.

Inspector Jarrett figured at the Reigate County Bench on Saturday, being the principal witness against motorists who had been summoned for various offences. In the case of John Rapley, chauffeur, of Burstow Hall, Horley, whom the inspector charged with driving a motor-car to the danger of the public; it was stated the officer had a narrow escape. Inspector Jarrett said the defendant, who was travelling at the rate of about thirty miles an hour, drove the car straight at him. He was on his bicycle at the time, and to escape being run down jumped off into the grass just as the car passed within a few inches of him. He was of the opinion that the defendant lost control of his car owing to a motor scout acting "like a maniac." Under cross-examination Inspector Jarrett said the reason why he jumped off his machine was because he thought discretion was the better part of valour, and he was not desirous of being run down by a motor-car. The allegations were denied, but defendant was fined £3 and costs.

At Newton-le-Willows, Charles Gartland, of Marton, Leamington, Warwickshire, was fined £10 and £10 15s. costs for driving a motor-car to the danger of the public at Winwick, Warrington, on August 7.

HEAVY HAULS.

At Wimbledon three motorists were, one day recently, fined £9 and costs for various technical offences.

Five motorists have been fined £1 each at the Woolwich court.

Under the Motor Car Act a batch of motoring defendants were fined at the Moot Hall, Newcastle, on Saturday last.

CARS AS OBSTRUCTIONS.

At the Bridgwater Police Court Ernest Edward and Frederick Morgan, motor-car drivers, of Taunton, were summoned for unlawfully leaving two motor-cars in High Street for an unreasonable period, viz., one hour, so as to obstruct the free passage of the highway, on Sep-

tember 4th. Mr. E. G. Boulting, of Taunton, appeared for the defendants, who pleaded guilty, and were fined 5s. and costs each.

DRIVING INTO SHEEP.

A Leeds chauffeur named Charles Butler has been summoned at Otley for driving a motor-car into a flock of sheep on the highway at Burley-in-Wharfedale. A farmer called on defendant to stop, but he ran full speed into the sheep, killing and maiming several. Butler was fined £5, or one month's imprisonment.

A WARRANT ISSUED.

At the Haywards Heath Police Court Albert Dodds was charged with driving a motor-car at a greater speed than twenty miles an hour at Clayton, on July 14th. P.S. Hughtley gave evidence that he arrested prisoner on a warrant the previous evening in Mayfair. Asked by the Acting Clerk (Mr. Ellison) why he did not appear to the summons, prisoner said that, being away, he wrote pleading guilty, and he thought his letter would have reached the Bench in time. Prisoner was remanded until Monday next, bail being allowed in prisoner's own recognizance of £20.

NO REAR LIGHT.

At the Otley Police Court, Albert Kaye, a Huddersfield draper, was summoned for driving a motor vehicle without a red rear light at Otley on August 4th, and also for refusing to stop when requested by a constable in uniform. P.C. Bemrose said that at eleven o'clock on the night in question he was on duty at Otley, when he saw the vehicle pass without a red rear light. He whistled and held his hand up, and the driver pulled up and nearly stopped. The witness went to get the name of the driver, when the car was set off at a fast pace.

A new design of Limousine body built and fitted to an Ariel chassis to the order of Mr. E. W. H. Beaton, by Mr. Max Graddon. Attention may be drawn to the construction of the sides, which are made detachable, transforming a closed town limousine into an open touring car with canopy.

Photo by]

[Wakefield, Brentford.

On making inquiries at Huddersfield he found that the defendant was the owner of the car, but on seeing Mr. Kaye, the latter refused to give the name of the driver. For driving without red rear light a fine of 2s. 6d. and the costs was imposed, and for refusing to stop the defendant was ordered to pay the costs.

EXCEEDING LEGAL LIMIT.

At Carlisle, on Saturday, the county magistrates had to deal with a number of charges against motorists of driving at excessive speeds. The first defendant was John Innes, Fen Court, London, whose speed in the village of Kingstown, three miles north of Carlisle, on the main road to Scotland, was stated by the police to have equalled thirty-one miles an hour, on August 24th. The bench imposed a fine of three guineas and costs and ordered the licence to be endorsed. The Chairman added that the bench were determined to put a stop to dangerous motoring in the village.

SPEED LIMIT IN ST. JAMES'S PARK.

Jules E. Vidoux, a chauffeur, living at Balls Park, Hertford, appeared before Mr. Fenwick at Bow Street Police Court on Monday, charged on a summons with driving a motor-car beyond the legal limit in St. James's Park. Park-keeper Gould stated that he timed a motor-car driven by the defendant over a measured furlong in Birdcage Walk, and found that it travelled at the rate of 22½ miles an hour. Lady Faudel-Phillips was in the car, and stated that she never allowed her chauffeur to drive more than 16 miles an hour, even in the country. Mr. Fenwick said it was perhaps impossible for park-keepers to estimate the speed of a motor to a nicety, but it was evident that in this case the legal limit of ten miles an hour had been greatly exceeded, and the defendant must pay 40s. and 2s. costs.

RACING AT BROOKLANDS.

THE race meeting on the Brooklands Track, Weybridge, on Saturday last was unfortunately marred by what proved a fatal accident. It occurred at the conclusion of the sixth race, in which nine competitors took part, and in which Mr. H. Vincent Hermon, who was driving Mr. J. T. C. Moore-Brabazon's Minerva racer, had finished sixth. The preceding competitors were all slowing up, but Hermon took the sharp bend at the junction at such a high speed that he was forced up the banking. Apparently fearing he was going over the top, he seems to have sharply turned the steering wheel, the wheel marks on the track showing that the car practically took a semi-circular course down the bank, eventually turning over on its side at the bottom, with the bonnet pointing in the opposite direction to which it had been travelling. The two rear wheels were smashed to pieces and the driver, Mr. Hermon, and the mechanic, Slade, were both thrown out. Assistance was quickly available and the two injured men were carried into the club house in the Paddock, where a nurse and a doctor were at once in attendance. About half-an-hour later a bulletin was issued to the effect that Hermon had sustained a broken arm and minor cuts and bruises, that Slade had no broken bones, and that both were going on as well as could be expected. After the races were over Slade, although covered in bandages, had so far recovered as to walk out with his friends. Hermon, however, was carried away on a stretcher to Brooklands Hotel, Weybridge. He was, as it transpired, much more seriously injured internally than was at first thought, and passed away about 8 o'clock the same evening. At the inquest, held on Monday, the jury, after hearing the evidence, gave a verdict of "Accidental death."

so that the competitors could be easily distinguished, and by announcing the average speed in miles per hour attained by the winning cars in the various races.

The opening contest was fixed for 2.30 p.m., and prompt to time nine cars turned out for THE FIRST 26-H.P. RACE of 120 SOVS., which was for cars of a cylinder dimension of 64 or under, and over a distance of 2½ miles. The winner received 80 sovs., the second 32 sovs., and the third 8 sovs. In view of the relatively low power of the vehicles the experiment was tried of starting on the finishing-line, so that the race might take place from beginning to end in view of the spectators. Oscar Cüpper, on a Métallurgique, got away at the start, and led for three-quarters of the distance, when he was passed by the Arrol-Johnston, Germain, and the Humber. Nearing the straight the Germain overtook the Arrol-Johnston, the former winning by two lengths. The result was H. E. Hall's 21-h.p. Germain (entrant driving), 1; E. A. Rosenheim's 25.6-h.p. Arrol-Johnston (J. S. Napier), 2; and W. Phillip's 25.6-h.p. Humber (W. G. Tuck), 3. The winner's time averaged 53½ miles per hour.

THE FIRST 40-H.P. RACE OF 97½ SOVS. brought out a field of six cars of a cylinder dimension of 100 or under. The distance was a short one—2½ miles—the vehicles entering the finishing straight without passing along the fork. The struggle for first place lay between Lieut.-Colonel C. D. Carleton-Smith's 38.4-h.p. Napier (H. C. Tyron) and Capt. G. Hinds Howell's 40-h.p. Iris (A. Clifford Earp). The former, however, drew away and won by about seventy-five yards. The result was: Lieut.-Colonel C. D. Carleton-Smith's Napier (Tyron), 1; Capt. G. L. Hinds Howell's Iris (A. Clifford Earp), 2; A. Huntley-Walker's 35.7-h.p. Darracq (entrant), 3; M. F. Mievill's 35.7 Berliet (entrant),

The Brooklands Race Meeting.—The scene on the Track immediately after the accident.

A regrettable disturbance following the accident; a number of people, including several photographers, clambered on to the track and the officials somewhat excitedly began pushing them down the banks, so that for a brief period the scene was anything but a decorous one. Later on, one particular photographer, who had been somewhat roughly handled, mainly owing to his persistent efforts to secure a snapshot of the accident, returned to the charge behind the paddock. Unnecessary force was again resorted to, with the result that for a few minutes there was a free fight between the officials and the photographer and his friends.

Apart from the accident the meeting was by far the most interesting so far held, the spectators numbering about 5,000. New departures were seen in allowing cars with their passengers to occupy the land on either side of the finishing straight towards the fork, the members' enclosure being on the paddock side and the ordinary motoring visitors' opposite, a goodly array of vehicles in both sections being *en evidence*. It was evident, too, that the officials are keenly alive to the necessity of rendering the racing more attractive to the public. Not only were the races started promptly but they were all over short distances, while an innovation was seen in a couple of handicap events, in which the starts, which had been worked out by Col. Holden, were given in yards. Although considerable time was lost in the five mile handicap in getting the seventeen competitors on their marks, the race proved most interesting, for while at the start the cars were spaced out all over the course, they soon closed up, and there was an exciting finish. The interests of the spectators were also studied by having large numbers affixed to the cars,

4; H. du Cros, jun.'s 36.1-h.p. Austin (J. Hadley), 5; and E. G. Williams's 39.4-h.p. Martini (entrant), 6. The speed averaged 68½ miles per hour.

By the non-starting of Warwick Wright's 89.5-h.p. Darracq, THE FIRST 90-H.P. RACE OF 8½ SOVS. proved a battle royal between three 75.9-h.p. Mercedes. The distance was about 5 miles, the winner receiving 55 sovs., the second 22 sovs., and the third 5½ sovs. J. E. Hutton led for nearly a lap, when he was passed by E. G. Drabble, who won by eight lengths from Hutton, the latter beating D. Resta on F. R. Fry's car by a length. A protest was lodged against Mr. Hutton, who had gone to the starting post without weighing in, owing to delay caused in repairing a damaged petrol pipe. The second prize was consequently awarded to the car driven by D. Resta. A speed equal to 92½ miles per hour was attained by the winner. Hutton's Mercedes bore little semblance to this well-known make of car, for the radiator had been removed and its place taken by a circular brass water tank, from which a series of nine small copper pipes extended along the sides and round the back of the vehicle.

Considerable interest was shown in the first FIVE MILE HANDICAP SWEEPSTAKES held on the track. The race, which was over about 5 miles, was for cars of a cylinder dimension of 125 or under. No less than nineteen entries had been received, and of these seventeen competed, the largest number of cars which has so far been seen in a race at Brooklands. A considerable delay ensued owing to the time taken up in getting the competitors on to their different marks, the handicaps angling from scratch to 1,750 yards, or nearly a mile. The race proved

exciting throughout, the progress of the scratch man as he passed the different competitors being closely watched. It was only on entering the home straight that he caught the leaders, but a couple of lengths separating the first two at the finish. The result was: S. F. Edge's 50-h.p. Napier (F. Newton) scratch, 1; Lieut.-Col. C. D. Carleton-Smith's 38-4-h.p. Napier (H. C. Tyron), 738 yards, 2; Mr. A. Huntley-Walker's 35-7-h.p. Darracq (entrant) 927 yards, 3. The others finished in the following order:—Capt. G. Hinds-Howell's 40-h.p. Iris (A. Clifford-Earp) 618 yards, O. Cupper's 48-3-h.p. Metallurgique (entrant) 98 yards, A. Huntley-Walker's 33-9-h.p. Darracq (K. Haussler) 1,053 yards, J. E. Hutton's 35-7-h.p. Berliet (entrant) 927 yards, G. F. Heath's 27-9-h.p. Minerva (entrant) 1,565 yards, T. Thornycroft's 48-6-h.p. Thornycroft (entrant) 76 yards, Mr. R. Hennessy's 48-6-h.p. Berliet (entrant) 76 yards, O. Cupper's 25-6-h.p. Metallurgique (F. Burgess) 1,750 yards, F. Guy Lewin's 41-9-h.p. Peugeot (entrant) 481 yards, H. Carle's 48-3-h.p. six-cylinder Mors (entrant) 878 yards, E. G. Williams's 39-4-h.p. Martini (entrant) 659 yards, H. P. MacConnell, 41-9-h.p. Rapid (entrant) 481 yards, and C. Hurford's 48-6-h.p. Mercedes (entrant) 76 yards. The speed of the winning car was equal to 65½ miles per hour.

Event number five was a MATCH FOR A 50 GUINEA CUP between Sir Ralph Gore's 75-h.p. Mercedes and Mr. Guy F. Lewin's 80-3-h.p. Hotchkiss, over a distance of about 5½ miles. Lewin was in trouble almost from the start with his clutch, which prevented him getting his third speed in. Consequently he was nearly lapped by the Mercedes, which covered the distance at a speed of about ninety miles per hour, notwithstanding that just before entering the finishing straight one of the rear tyres flew off, the driver continuing on the rim.

It was in the FIRST 60-H.P. RACE OF 120 SOVS. that the fatal accident occurred. The contest was over a distance of 3½ miles, the entrant of the winner receiving 80 sovs., the second 32 sovs., and the third 8 sovs. The event was for cars of a cylinder dimension of 150-1 or under. Eight vehicles started out of nine entered, the result being S. F. Edge's 60-h.p. Napier (driver, S. Smith), 1; S. F. Edge's 60-h.p. Napier (F. Newton), 2; Oscar Cupper's 48-3-h.p. Metallurgique (owner), 3; Capt. the Hon. D. Carleton's 60-h.p. Napier (Glentworth), 4; Mr. A. Huntley-Walker's 55-8-h.p. Darracq (owner), 5; Mr. J. T. C. Moore-Brabazon's 52-1-h.p. Minerva (H. V. Hermon), 6; S. F. Edge's 60-h.p. Napier (J. F. Browning), 7; Mr. E. Herington's 58-h.p. Ariel-Simplex (A. Harrison), 8. The race was a well-contested one, Mr. O. Cupper's Metallurgique running strongly for a good part of the way. One of the tyres of Smith's Napier came off about two miles from the finish, but he continued on the bare rim of the wire wheel. The speed attained was equal to about 76½ miles per hour.

Five entries had been received for THE MERCEDES HANDICAP SWEEPSTAKES of 20 sovs. for acceptors (the entrant of the second receiving a quarter of the stakes), for cars of a cylinder dimension of 175 or over, but only three cars faced the starter. The contest was over a distance of about 3½ miles. Mr. S. F. Edge's 94-h.p. Napier, driven by C. A. Glentworth, was on the scratch mark, while Mr. J. E. Hutton on his 75-9-h.p. Mercedes and Mr. E. G. Drabble on a similar car each received 387 yards start. There was a good struggle for the first place between the two Mercedes, but eventually Drabble drew away and won easily, Hutton being second and Glentworth third.

AUTOMOBILE ACCIDENTS.

A MOTOR-CAR accident has just occurred on the Cambridge main road. Mr. J. P. Granville, of Dulwich, was motoring from Newmarket to London, and when descending a hill near Audley End a traction engine emerged from a brickyard half-way down the hill, while on the opposite side of the road were some school children. Mr. Granville's first consideration was to avoid the children, and in doing so he collided with the traction engine, smashing the front of his car. Two ladies were with Mr. Granville in his car, but, fortunately, all escaped with a severe shaking.

WHILE Dr. Felix Lane, of 26, Almeric Road, Clapham Junction, was proceeding in a taximeter cab on Monday along the Embankment, a portion of which is under repair, the chauffeur, in his efforts to avoid a van, apparently lost control of the steering-gear, and the motor dashed with great violence into a gas standard in the centre of the road. Every pane of glass in the vehicle was smashed, and Dr. Lane was hurled through the broken framework, his face and head being badly cut.

HERBERT WARRELL, a motor-omnibus driver, of Eswyn Road, Tooting, was charged on remand at Tower Bridge, on Monday, with the manslaughter of James Hales. Warrell was driving a motor-omnibus along Newington Causeway, and to avoid running over a man who started to cross in front of him he ran the vehicle on to the pavement. In doing so he knocked down a post, which, in falling, struck Hales and his brother, who were standing talking in the middle of the pavement. Both men were knocked down, but while one was practically uninjured, Hales was rendered unconscious, and died soon afterwards at Guy's Hospital from fracture of the skull. At the coroner's inquest the jury returned a verdict of accidental death, and exonerated Warrell from blame. Warrell was subsequently discharged at the police court.

THE SIRDAR RUBBER COMPANY, LTD., have received an order to fit Royal Sirdar solid tyres to gun carriage tractors for the War Office.

ROAD REPORTS.

BROMLEY.—An effort is being made by the road authorities in Bromley (Kent), to secure a reduction in the speed of motor vehicles travelling through the town. The borough council are taking action in the matter, and have applied to the Local Government Board for a regulation to be made that no person shall drive a motor-car through certain streets at a speed exceeding ten miles an hour.

KESWICK.—The high road between Keswick and Windermere was early in the season treated for the prevention of dust arising from the motor-cars. The result leaves a surface so greasy and slippery that horses can with difficulty keep their feet. A correspondent suggests at this season of the year, when coaches are so often overlaid, such a state of things is sheer cruelty to the horses.

CRIEFF.—At a meeting of Crieff Town Council the question of the speed of motor-cars in the burgh streets has been again under consideration. The Secretary for Scotland, in reply to a former request by the Council to restrict the speed to ten miles an hour, refused to grant an order to all the streets, but stated that he would be prepared to consider an application for such regulations in which certain streets were specified. After a discussion, a report by the Roads Committee was approved of, in which most of the streets in the town were scheduled as being dangerous for a speed of motor-cars exceeding ten miles an hour, and asking the Secretary for Scotland to grant an order to that effect.

WORCESTERSHIRE.—During the course of the discussion on motor-cars and highways at the last meeting of the Worcestershire County Council, Mr. E. J. Bigwood stated that he did not believe they could adopt any system likely to allay the dust at a cost of less than £35 a mile per annum.

BATTLE.—The Battle Urban District Council have adopted a

A corner of the "Motor House" Sale Room on the occasion of the Daimler and Napier car sale.

resolution calling upon the County Council to place danger warning boards at specified points within their area.

MUSSELBURGH.—The Town Council of Musselburgh have made application to the Secretary for Scotland praying that regulations should be made restricting the rate of speed for motor-car traffic to ten miles an hour (on certain highways) within the limits of the burgh.

EXETER.—The road from Exeter to Moreton Hampstead is in a highly dangerous condition for motor-cars, owing to excavations about ten miles from Exeter.

TARRED ROADS COMPENSATION CLAIMS.—The Esher and Dittons Urban District Council, which has been making experiments on the main road in its district with a view to combating the dust nuisance by spreading tar preparations thereon, has decided to resist three claims for compensation made by two cyclists for damaged clothes, and by a motorist for injury done to his car, the contention being that due notice was given of the experiment, and that warning notices were posted at either end of the length of road treated.

CROWBOROUGH.—At Monday's meeting of the Uckfield Rural Council attention was called to the state of the Station Road, Crowborough, and it was decided that its repair should be immediately proceeded with.

RAPID progress is being made with the erection of the Humber Company's new works in Folly Lane, Coventry. At present one section is completed so far as the building is concerned, and is being used for body-building purposes.

MR. G. T. HILTON, the Rugby agent for Humber cars, reports that so far this year he has run a 15-h.p. Coventry and a 30-h.p. Beeston Humber over 30,000 miles on hire, and has not failed on a single journey with the exception of an occasional puncture.

FORTHCOMING EVENTS.

SEPTEMBER.

- 21st (S.).—Nottinghamshire A.C. hill climb.
 Southern M.C. closing run at Ewell.
 Auto Cycle Club meeting at Lincoln.
 Derby A.C. run to Dovedale.
 Blackheath A.C. run to Westerham.
 Hertfordshire County A.C. members' driving test.
 West Essex A.C. run to Shenfield.
 Notts A.C. hill climb.
 North London A.C. run to Hatfield.
 Motor Cycling Club run near Luton.
- 23rd (M.).—Inaugural dinner in connection with the northern offices of the Automobile Association at Manchester at the Midland Hotel, Manchester.
- 25th (W.).—R.A.C. examination for driving certificates.
- 28th (S.).—Ipswich and East Suffolk A.C. petrol consumption trial.
 Midland A.C. at Tudor Grange, Solihull.
- 29th (Su.).—Run of the Southend and District M.C. to Bishop's Stortford.

OCTOBER.

- 5th (S.).—Brooklands A.R.C. meet.
 Speed judging competition of the West Essex A.C.
- 12th.—Close of the Commercial Vehicle Trials. Final run from Baldock to Dalston, London, N.
- Southend M.C. closing run of the season to Witham.
- 19th (S.).—Auto-Cycle Club's quarterly trial.

MARCH, 1908.

- 21st-29th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

LIGHTING-UP TIMES—LONDON.

To ascertain the approximate times in Glasgow an addition of 20 min. should be made to the above figures; in Manchester an addition of about 7 min. is necessary.

CLAIMS AGAINST MOTORISTS.

IN the Under Sheriff's Court at Bristol, Mrs. Maria Merrick, an elderly lady, living in Clifton, has been awarded £650 damages against Mr. Clifford G. Rattray, of Frome. The claim arose out of a motor accident on May 16th, when Mrs. Merrick was run over by a car, which, it was alleged, the defendant was driving negligently.

A CLAIM was made by H. E. Tierney, labourer, against Mr. W. Eden Walker, J.P., of Saltburn, on Tuesday, in the City of London Court, to recover £50 damages, for being knocked down, on March 21, in Knight-rider Street, owing to the furious driving of what was alleged to be the defendant's car. Tierney said the car made off as quickly as possible, but not before the number (LC 8,457) had been taken. Mr. Harry Dobb, defendant's counsel, said that the number was correct, but the car was in Yorkshire at the time in question. It had not been out of the county within months of the accident. For the plaintiff, several witnesses were called, who said they were quite sure the defendant's car did the damage in question. Mr. Walker, the defendant, said he was quite sure the car did not do the damage. He had two cars, and the other was in the South of France. The plaintiff's suggestion that the number plates had been exchanged was absurd, as they were painted on. The jury stopped the case, and found for the defendant.

POLICE TRAPS.

AT Littlebourne the police have a motor trap leading to the Wingham Petty Sessions.

AT Stilton there is a trap worked by a couple of police-constables who are generally located behind two telegraph poles.

A NEW trap has been started at the foot of Alconbury Hill, which is being worked regularly.

AT the Frystone Park corner of Selby, Inspector Pattison, of Shirburn, who is obtaining considerable local notoriety in connection with motorists, has a measured quarter of a mile.

GIVING evidence at the Kingston Police Court, a police-sergeant has acknowledged that the motor trap, of which he was in charge, was partly down one hill and up another, with a stretch of level ground between.

AT Esher, on the Portsmouth road, is a motor trap in frequent operation.

BETWEEN the fifth and seventh milestones on the Queensferry road from Edinburgh a motor trap is in frequent operation.

THE police have measured a quarter of a mile on the main road from Huddersfield, along which motorists are timed. Information as to its exact whereabouts was refused by the police-sergeant at the Saddleworth Police Court, on the ground that if he gave the information it would be reported in the motoring press.

NEAR Mitchell Hill, Chapeltown, Leeds, is a measured distance of a quarter of a mile.

PYCOMBE, Patcham and Southwick are three well-known Sussex villages in which traps are constantly in operation.

PUBLIC MOTOR SERVICE.

NEARLY 6,000 passengers were carried during August by the London and South-Western Railway motor-omnibus service, which runs between Farnham and Haslemere Stations, via Hindhead, Churt and Frensham. This constitutes a record for any month since the service was started two years ago.

BUSINESS NEWS.

MESSES. TESTE AND LASSEN, Warwick Street, W., are about to introduce a new London-built car. The vehicle is of 14-20-h.p., and is fitted with a four-cylinder engine.

THE ATLAS ENGINEERING COMPANY, of Levenshulme, Manchester, have sent us an illustration of a new metal wheel for touring cars and an improved detachable adjustable rim they have recently introduced.

THE APOLLINARIS COMPANY, LTD., of Stratford Place, Oxford Street, W., are employing a 30-40-h.p. Daimler for the use of their travellers.

AT the Oak Lane Garage, Bradford, of the Northern Automobile Company, Ltd., Mr. Albert House held an auction sale of cars, &c., on the 18th inst.

THE Heavy Vehicle and Export Department of Fiat Motors, Ltd., is now under the charge of Mr. Sidney W. Lewis, who has had many years' experience in such matters. For sixteen years he was connected with Messrs. John Birch and Company, Ltd., engineering merchants, of London, and during the latter part of this time was in charge of the motor export department. He has travelled round the world, and thereby gained much knowledge and experience, which has since proved invaluable to the firm he represented. For this reason his services are likely to prove equally valuable to Fiat Motors, Ltd., who are now making a special feature of their motor export department. Agencies are already established in India, Egypt, and Australia, and negotiations are in progress in connection with further representation in the Straits Settlements, South Africa, Ceylon, and New Zealand. Fifty cars are being built to orders received from India—five of them were despatched to Bombay last week—while fifteen are now on the road to Australia, and twelve will be sent to Cairo within the next three months.

MOTOR SCHOOLS, LIMITED, have been appointed official instructors to the British Motor Boat Club. The instruction launch is moored off Messrs. Hart and Harden's shed at Kingston Bridge.

ON the main road into Ledbury from the cathedral cities of Worcester and Hereford Messrs. F. C. Swift and Co. have set up an excellent motor repair shop.

LEDBURY is an interesting district, associated with the name of Mrs. Browning, the poetess, and visitors have been availing themselves of the facilities for motoring in the locality provided by Mr. W. L. Tilley, of the Motor Garage in the High Street.

AT the Central Criminal Court, on Monday, before Mr. Justice Bray, Robert Eyraud, aged twenty-one, a chauffeur, of Paris, was sentenced to six months' imprisonment with hard labour for the manslaughter of May Smith, aged fifteen, who died from shock following a fractured skull caused by being knocked down by a motor-car in Oxford Street.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, SEPTEMBER 28, 1907.

[No. 447.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

ALL the records are not made at Brooklands. In New York there is a fine thoroughfare, Upper Amsterdam Avenue, similar to our own Oxford Street in London. Instead, however, of a decently smooth surface, it has cobble stones not unlike some of the highways about Preston, while, for motor-car drivers, there is a ten-mile limit, as though it were some Sussex borough. Apparently it has been used by at least one of the automobile firms as a splendid place whereon to test the possibilities of motor-cars. A driver was doing this successfully when he was espied by a couple of detectives, who were out in Commissioner Bingham's automobile, looking for just such drivers. They were at 105th street when they saw a cloud of dust up the avenue, rapidly nearing them. Next moment an automobile flashed by them, and they started in pursuit. For a mile and a-half they were behind, and one of them, timing the flying automobile on his stop watch, found that part of the distance had been covered at the rate of six miles a minute. At Seventy-fifth street the automobile slowed down and the driver was arrested. When the police gravely told the judges in the Special Sessions Court that the defendant was travelling at the rate of 360 miles an hour, the motorist looked somewhat askance. The judges were appearing to question the police veracity—it would have been accepted implicitly in Surrey—when the motorist hurriedly whispered to his lawyer, who quickly entered a plea of guilty. The defendant was fined 100 dollars, in return for which he has legal testimony as to the speed of his car. Possibly he may hand the certificate to Mr. Ross, the American gentleman who is anxious for speed, on his return to the States.

Technical Education.

In another column we mention a few of the educational centres at which instruction in automobile work will be given during the coming season, and shall be glad to have the assistance of our readers in extending publicity to any other institutions which thus have regard to the needs of the time. From the outset we have done what was possible to foster this movement for technical education in motor-car work at the polytechnics and technical institutes, recognising that both theoretical and practical knowledge of the motor-car was one of the best means to secure efficient drivers, and so ensure the safety of the road so far as the automobile was concerned. The opportunities for obtaining information have increased very considerably of late, and this development is to be welcomed for more reasons than one. In the early period it was urged that

chauffeurs were often careless and not always competent. The adoption of a higher standard of knowledge of a practical kind is probably the best means of preventing such failings in the future; hence the encouragement that should be given those educational authorities which are enterprising enough to establish classes of this kind, especially when they are supplemented by actual driving tuition.

On the Towpath.

MR. W. Y. COCKBURN, the Chairman of the Kingston-on-Thames County Bench, at which many hundreds of motor-car prosecutions have been heard, has been referring to the continued running of motor-cars on the Barge Walk, which stretches along the Middlesex bank of the Thames from Kingston Bridge to Hampton Court Bridge, and in respect of which a Local Government Board inquiry for the closing of the walk to motor-cars was held at Hampton Wick on June 5th last. Mr. Cockburn says he understood that a statement was officially made shortly after the inquiry to the effect that, on account of the danger to pedestrians and other persons using the Barge Walk, it was decided to close it to motor traffic, but on visiting the walk recently he was very much surprised to find motor-cars still running there. He and others were anxious to know when this order was going to be given effect to, for there could not be the slightest doubt that persons who frequented the place were in danger so long as motor-cars were allowed to be driven there. Mr. Cockburn added that he had heard of many cases where cyclists and persons owning carriages had given up going along the Barge Walk on account of the danger. We understand that the order has since been issued.

Rear Lights on Vehicles.

IN our Correspondence columns a victim of police watchfulness with regard to the rear lights on motor-cars asks as to the legality of the endorsement of the licence for such a small offence under the Motor Car Act of 1903. We are sorry we cannot do other than confirm the view that magistrates have it entirely in their power in endorsing licences; in fact, the Act gives them no option in the matter. The particular Article dealing with the subject is Section 4, which declares that particulars of the conviction and of any order of the court shall be endorsed upon the licence for all offences save the first and second under Article 9, which deals with the legal limit. This is a point that in any future legislation will have to be carefully considered, as in this particular instance no inconvenience or danger to the public has been caused, and, as every practical motorist knows, the rear light trouble is not an easy question for solution. In towns and places where traffic is congested in well-lighted streets, the heinousness of the crime is not so apparent

as elsewhere, and surely there should be some magisterial discretion allowed.

Benzol v. Petrol.

DURING the past month Mr. F. K. Rider, of Leeds, has been using benzol daily for his car (8-h.p. Rover), with most satisfactory results. He finds he can obtain considerably more power with this fuel, the car climbing on top-gear hills that he had hitherto been obliged to change gear for. On removing the cylinder, after a month's running, there was a slightly greater deposit of carbon on the cylinder walls and piston head than with petrol, but as regards the condition of the valves there is no appreciable difference with the two fuels. On starting up from cold he finds it a little more difficult with benzol, owing to its greater specific gravity. Mr. Rider made an additional air inlet to his carburettor, but that is only required on hot days, the carburettor working equally well with petrol or benzol. Of course, the great advantage of using benzol is the price, which works out, including carriage, at 10d. per gallon. This experiment was conducted on a weekly mileage average of 250 to 350 miles, and travelling at thirty-five to forty miles to the gallon.

Mr. Paul Brodtmann, managing director of the Continental Tyre and Rubber Co. (Great Britain), Ltd., at the wheel of his 45-h.p. Daimler, fitted with Continental Non-skids, on the summit of the "Brocken," Hartz Mountains, Germany (height 3,768 feet.)

The A.A. in Manchester.

Now that the Automobile Association has gone northward, motorists in the Lancashire areas should become more confirmed week-enders than they have hitherto been. There is plenty of good work to be done, and well done, by the scouts of the A.A., and they should quickly attack the traps in the Lancaster district, the roads leading thereto being a conspicuous centre of operations. Carlisle, too, is another danger spot, and if the Association's agents succeed in disheartening the police in those two places alone they will justify the opening of the office in Manchester from which operations will be superintended. The development of their defensive policy has been well conceived and efficiently carried out, for the duties of the scouts do not end with protecting members of the A.A. from the provoking and un-English methods of the police. The system which has been adopted secures their aid in many other ways, while the plan of road reports places at the disposal of the members information that may often be valuable in resisting unfair claims for alleged delinquencies on the road, as well as in combating police evidence. The Association is to be congratulated on its going northward; the North should reciprocate this attention by supporting the society as loyally and as numerous as those in the south have shown themselves convinced of its fitness.

The Troubles of the Police.

THE alleged infallibility of the police has received some great indentations of late, and suggestions of perjury, with magisterial disregard of police evidence, have shattered the idol that some people had set up with regard to the accuracy of the policeman's word. Motorists have long chafed under the system of never doubting a constable's oath adopted by bucolic magistrates when questions of speedy travel were involved. They, therefore, are not surprised that the police, emboldened by the ease with which they can persuade the Bench against motorists, are now extending their prevaricating operations into other directions. But they will quickly over-reach themselves, if they have not already done so. Now and again there are indications that the magistrates in some districts are not so gullible as of yore. Thus the other day a motorist was summoned before the Kingston Bench for exceeding the speed limit at Esher. Mr. William Taylor-Parkes defended, and submitted that the method adopted in ascertaining whether he had exceeded the speed limit was a very unsatisfactory one, as it was very difficult to estimate the speed of an approaching car unless it actually passed the person judging. The Bench upheld this contention, and dismissed the summons, the chairman stating that the car ought to pass the observer, and the method adopted by the police was very unsatisfactory.

Acknowledging an Error.

AND now comes another instance of police evidence similarly discredited. Prosecutions against two Darwen cotton manufacturing firms for exceeding the speed limit with motor-lorries have had a singular ending at Bolton. Messrs. T. and R. Eccles, Lower Darwen, had been fined £5 for a similar offence at the same place, and notice of appeal was given. Subsequently the chief constable of the county communicated with the appellants' solicitor, informing him that it had been ascertained that the police had made a mistake in a quarter-mile measurement, and under these circumstances he proposed that the conviction should not be recorded and that the payment of the fine should not be enforced. Prosecutions in the other cases were, therefore, formally withdrawn. That the police measurement should have lacked correctness is not a new fact in the situation; but that the police should have acknowledged their error is truly remarkable. We wish we could regard the incident as an omen for an improvement in their behaviour throughout the country.

The Commercial Vehicle Trials.

THE great procession of motor-vans, lorries, and heavy vehicles is now in its third week, and has been turned towards London again. On Tuesday the vehicles in the trial were on exhibition in the North Haymarket, Liverpool; and on Wednesday the vehicles ran to Manchester for the exhibition there on Thursday. Up to Saturday last the following cars had made non-stops since the beginning of the trial:—A6, Unic Van; B12, Lacre Box Van; C18, Dennis Covered Van; E30, Hallford Lorry; E32, Siddeley Canvas Tilt Wagon; E33, Straker-Squire Open Van; E41, Dennis Van; E43, Commercial Cars Lorry; E45, Thornycroft Lorry; F52, St. Pancras Lorry, and H58 Burrell Steam Tractor. Many of the others have made most creditable performances, and a better aggregate result was noted in the second week than in the first. There are now fifty-three vehicles remaining in the competition.

The Position of the French Motor Car Industry.

FOR some time past rumours have been current that the French motor-car industry has not this year been in a very healthy condition, and that the 1907 season is closing with a much heavier stock than usual of unsold cars, more especially of those of relatively high power. For a long time France had practically a monopoly as regards motor-car construction, but within the past

few years many large factories have sprung up not only in this country but also in Italy, Germany and the United States, with the result that French builders, who have hitherto relied on the export trade as the main support of their business, are meeting with increased competition at every turn. With the view of ascertaining whether the disquieting reports have any foundation in fact, the *Motor-Car Journal* recently caused a special enquiry to be made as to the present position of the motor-car industry in France. The first instalment of our correspondent's report, which is a very exhaustive one, will be found in the present issue.

Tarred Roads.

It would appear that the troubles of the authorities who, to avoid dust, have adopted preparations for the surface of their highways are only just beginning. Cases of compensation are becoming frequent, and although the authorities have not yet conceded anything in this way, complaints are becoming almost as rife as the dust in the days before the tarring. At Chatham an unexpected sequel has followed the Chatham Town Council's experiments in tarring the highway in

asserted his belief with regard to the measures to be taken for the suppression of dust. These are of two orders. (1) Mitigative: Sweeping, sprinkling with water, either pure or with an addition of deliquescent salts (chloride of calcium or of magnesium, Aconia). (2) Curative (specially for macadamised roads): Sprinkling with water with an addition of bituminous oil (Westrumite, Rapidite, Goudrogenite, Hahnite, &c.); the sprinkling is easy, but the effect will not last long in the case of motor-car races, festivities, &c.; sprinkling with petroleum (particularly in California); tarring the roads. The latter is recommended in the resolution which Dr. Guglieminetti will submit to the Congress of medical men; it also seems, despite the complaints that have been made, to be most generally in favour among road authorities.

Horse v. Motor.

QUITE a joyful note prevailed in the speech of Mr. F. W. Griffin at the Spalding Foal Show dinner last week. Mr. Griffin is a well-known breeder and exhibitor of Shire horses. He said he did not think Shire horse breeding was ever on such a sound basis as it was to-day. There had never

Mr. Charles E. Shaw, M.P., of Tottenhall Wood, at the wheel of his new Star six-cylinder Car. This is the second vehicle which the Star Engineering Company have supplied to Mr. Shaw.

New Road, in that borough. The tar adhered to the boots of people who had to cross the road, and the floor of the new church of the Presbyterian community was badly soiled, marked, and discoloured. The executive of the church has called upon the Town Council to bear the cost of scraping and polishing the floor, but the Corporation declines to admit any responsibility. It remains to be seen whether the elders will seek to enforce their claim by legal process, but the point is interesting, similar complaints having been made elsewhere.

Tarring the Roads.

In this connection we notice that Dr. Guglieminetti, who proposed the first trials in connection with tarring the roads at Monaco in 1901, maintains his conviction that this system gives the most satisfactory results. When he came to England to take cognisance of the trials held at Ascot under the auspices of the Roads Improvement Association he was very emphatic on the point, and rejoiced at what he regarded as advanced English opinion on the subject. This week, at the Congress of Health which is being held at Berlin, he has again

been a time when the foreigner was so much on the look-out for good Shires. He himself had never had a better year. People were coming from all countries and asking for Shires, and he believed there was a great future for Shire horse breeding. He was convinced that motor power was not going to hurt them. Those who drove motor-cars knew that they cost a great deal of money, and for moving heavy traffic he was quite certain they would never do any good. The motor-omnibuses were being taken off, for they were not paying a dividend, and the railway people had told him that they had tried motor power and it was no good to them, and that they had more horses working to-day than ever. He recommended that they should stick to Shire horse breeding. We are afraid that Mr. Griffin scarcely reads the signs of the times aright, for the Commercial Vehicle Trials now in progress are revealing something of the possibilities of the motor-van.

A REWARD of £5 is being offered by the Automobile Club of Indiana for the arrest and conviction of any person throwing glass on the streets or public highways of Indianapolis, U.S.A.

EXIT THE C.T.C.

WE motorists talk so much of touring that it is curious to reflect that we have not yet founded a body to cater specially for our needs as tourists. We are mighty particular to see that our cars are touring cars. We take part in endless competitions to prove that they really are touring cars. We use them for touring purposes with great assiduity, yet, as I have said, we have no organisation whose special duty it is to shepherd the motor tourist. In this we contrast somewhat curiously with our cycling friends, who have a Cyclists' Touring Club, yet admit to themselves that they have as a body ceased to tour, and now merely race or potter.

Some time since, recognising the incongruity of the situation, some of those in the ranks of the C.T.C. endeavoured to amend its constitution so as to include motorists in its scheme. But the ossification of idea and enthusiasm so apparent in the changed character of the club's membership was too far advanced to permit such a modernisation, and it was rejected. Out of that rejection arose a turmoil and a strife that has practically

That being so, the body to whom we must look for a development on the lines of a touring organisation is the Automobile Association. That young society has, up to the present, successfully concentrated its efforts on a narrow but much appreciated programme, and there is no reason to apprehend any immediate diminution of its necessity or use. But the present absurd condition of affairs in the official control of road traffic cannot be prolonged beyond a year or so, and, with an accession of sanity and justice on the part of our rulers, something of the *raison d'être* of the A.A. as at present constituted will have disappeared. But in any event I offer it as a suggestion that the Automobile Association should adopt in this country the functions so admirably performed for French tourists by the Touring Club de France. It has the organisation; it has the officials, the energy, and I should say the funds necessary for an admirable start. It possesses the nucleus of a Touring Club of Great Britain, if those running it care to adventure. Such a programme would only be a development of the A.A.'s present lines, for it commenced some time ago to erect information and distance plaques at the entrances and exits to all our southern

A well-known spot in Surrey.—An Argyll Car at the Hautboy Hotel, Ockham.

rung down the curtain on the Cyclists' Touring Club as a popular or even a live organisation. A discredited management, a depleted membership, and bitter personal animosities dividing its councils, mark the beginning of the end. Like many another and similar body, it has outgrown its usefulness, and it remains for the new tourist—the motorist—to organise some body to take up the white man's burden.

Motoring in this country has probably quite as many societies founded to care and tend us as is probably good for anybody concerned. They have begun to wrangle for the right to do this and that, and we have the unedifying spectacle of the Motor Union poaching on the very clearly defined preserves of the Automobile Association at a time when it would be better employed endeavouring to retain the support and allegiance of the long-suffering and discontented motor-cyclist. The Motor Union has too much on its hands, and it would be well advised to restrict its programme and to cover that programme thoroughly. Its legislative functions and responsibilities are far too important to be jeopardised in the fashion that seems highly probable if its energies are allowed to branch out in the bewildering fashion that has characterised recent developments at No. 1, Albemarle Street, W. Its programme requires pruning.

villages and towns. A little elaboration of these towards the T.C.F. model is all that would be required, and the institution of a touring bureau for the issue of maps, guide books, &c., would not, I am sure, overweight the abundant capacity for work of the capable staff. There is an admirable model to hand in the T.C.F. It has avoided the error of entering upon a trading programme for its members which has injured the Motor Union and the Cyclists' Touring Club. The hotel scheme of the latter is an anachronism. It certainly would not be desirable to cumber up the touring department of the A.A. with such an involved and trouble-begetting device. By the time that it had all our roads properly signalled and boarded, and its bureau provided with all the multifarious information which would be required by its members, it would find its hands just as full as efficiency could permit.

TRIVIATOR.

MESSRS. EVAN JONES AND SON, who have depots at Pen-y-groes, Ebenezer and Pwllheli, have their headquarters at Carnarvon, where motorists passing through the town are always welcome at their garage in Bangor Street. They have a smaller depot at Castle Square.

AN EARLY MORNING MOTOR RIDE.

I WAS dining one evening last week at a well-known Italian restaurant in Wardour Street, W., and during the coffee I was joined by the amiable "restaurateur," the proud possessor of a 24-40-h.p. Fiat, and he proposed a motor trip on the morrow, which I accepted with much gusto. To my surprise, however, when making the final arrangements he suggested that his chauffeur should call for me at 5 a.m. the following morning. I demurred for some time, thinking of the unusually early hour, but at last I acquiesced, and at 5 a.m. was aroused by the toot of the Fiat standing at my door in Regent's Park. It was not many minutes before I was seated in the car and being driven towards the well-known hostelry of my previous night's enjoyment. There, on our arrival, 5.30 a.m., was mine host waiting with hot coffee, rolls, &c., for our consumption. We were here joined by a Maltese gentleman, and started at 6 a.m., the route suggested being *via* Sevenoaks to Bexhill for breakfast, thence to Hastings, and on to Bodiam for lunch, then to Tunbridge Wells for tea, and town for dinner.

Our route lay through the South-east portion of London, and it being a Saturday we experienced some delay occasioned by the early morning market traffic, but having successfully negotiated it we were soon out of London careering at a delightful pace towards Sevenoaks. I cannot properly describe the exceptional exhilarating feeling to be obtained at such an hour of the morning. It happened to be a fine day, not too cold, and the air seemed impregnated with some sweet odour which seemed to lift one from Mother Earth. The country was at its best. We reached Sevenoaks before 7 a.m.; we did not stop, however; the car was going splendidly, and on we went through the deserted town, when we were surprised to meet, at such an early hour, a pack of hounds with the huntsmen in their scarlet liveries. After slowing down to admire the pretty picture it was not many minutes before we were well on our way again. The surroundings, the country, the early morning life, were so delightful that before I was aware of the fact we were on the outskirts of Bexhill. Not very long after we pulled up at the Metropole Hotel, and were soon seated in its cosy dining room enjoying our omelette and coffee.

Breakfast over, a walk to view the motor track and a lounge round the town was the next item on the programme. At 11.30 we were again seated in the Fiat making tracks through Hastings towards Bodiam for lunch. Not in any hurry, we reached the Castle Hotel comfortably at 12.15. Here we were met by some friends of mine host who had ridden over earlier in the day and had ordered us a good old-fashioned lunch, which I believe this hostelry has a reputation for, or at any rate ought to have. After the lunch, to which we all did justice, a walk to view the castle remains was suggested—and they are really worth a visit, being, in my mind, in as good a state of preservation as any ruins in England. An hour or so was spent in exploring the surrounding country, and then we again started on the car, this time making tracks for home through the delightful scenery surrounding Tunbridge Wells. Passing through this town we pulled up at the Royal Oak Hotel at Tunbridge for tea. Leaving there at about 5.30 p.m. we were soon flying up the long and tedious ascent before the drop into Bromley. It was not long after that we were on the outskirts of our destination.

The difference between our going through New Cross and returning on Saturday evening is better imagined than described. However, thanks to the excellent handling by the chauffeur, we arrived home safe and sound at about 6.30 p.m., thoroughly convinced that to obtain a perfect motor drive free from traffic and police traps and to realise the beauty of nature in its early attire it is necessary to start your journey with the morning deliveries of the milk.

J. H.

Of a motor-cyclist, fined for exceeding the speed limit, at the Greenwich Police Court, the magistrate observed, "He has one excellent qualification for a motor-cyclist, he is so deaf that he cannot hear the objurgations that probably follow in his track."

THE BRAMLEY VALVE ATTACHMENT.

NOTWITHSTANDING the many varieties of tools on the market to facilitate the removal of the valve springs of petrol motors, there are still a large number of motorists who have not equipped themselves with such useful appliances. The result is that engines are frequently kept running in a mediocre condition when, were it possible to easily remove them, a grinding in of the valves would effect a considerable improvement in the power developed. With the new attachment which has lately been introduced by Messrs. Bramley and Co., of Okehampton, Devon, and which we illustrate in Figs. 1 and 2, all difficulty in this direction is now removed, for by its use it is possible to compress the spring in order to withdraw the retaining cotter entirely by hand, or at most by the use of a light cycle spinner. Referring to Fig. 2, the usual spring-retaining cup and cotter are shown on the right, while on the left are the three parts which form the components of the Bramley device. First there is an externally threaded sleeve which is slipped over the end of the valve stem and secured in place by passing the cotter through the hole in both the sleeve and the stem. The spring and its cup are next slipped over the valve stem, and then a nut is screwed on the sleeve,

Fig. 1.—The Bramley Valve Attachment as fitted in position.

Fig. 2.—The Component Parts of the Bramley Valve Attachment.

compressing the spring as it proceeds, until a groove formed at about the centre of the sleeve is uncovered. A crescent-shaped washer which acts as a lock-nut is then placed in the groove, and the nut screwed down on to it until the whole is securely locked together. No alterations are needed to the engine to convert the valves to the new system, the only change necessary being a slightly shorter spring which the makers supply, and which they guarantee to exert the same pressure when in position as the old one. Judging from the model Messrs. Bramley have sent us the idea is as effective as it is ingenious. The only point which is, we fancy, likely to cause annoyance is the crescent-shaped washer, which in its present form is inclined to slip out of position, and probably fall into the mud shield below the engine, ere it is gripped by the nut as the latter is screwed back. This might be remedied by the use of a spring washer or a pivoted one made caliper shape to encircle a great portion of the sleeve.

THE Ross-on-Wye Rural Council are getting up a petition to send to Parliament that all licences in connection with automobiles should be paid into one fund all over the country, and divided amongst the different counties towards road maintenance.

B

CONTINENTAL NOTES.

The Semmering Hill Climb.

The annual hill climbing competition up the Semmering organised by the Austrian Automobile Club, over a ten kilometre course, attracted a very large number of entries, the competitors being divided into several classes. The best time of the day was made by Poege, who drove his 120-h.p. Mercedes up the hill in 7 min. 29 1-5 sec., beating the record made last year by Braun on a 100-h.p. Mercedes by 10 1-5 sec.

A Novel Hill Climb.

The Automobile Club de Spa held a somewhat novel hill-climbing competition on the 15th inst. on the Malchamps Hill, near Spa, Belgium. The ascent, which measured five kilometres, had to be made four times without the engine stopping. The competition was open to all types of petrol cars, those fitted with two-seated bodies having to carry 150 kilogs. of ballast; the entries were ranged in the order of the power of the engines in accordance with a formula, the largest being first and the smallest last. The total time for the four ascents was recorded against each competitor's name, and it was on the results obtained that the separation of the vehicles into categories was based. Thus, the first class was established by the car which made the best time of the day; and in it were placed those vehicles of an equal or greater cylin-

average and the actual times recorded was then worked out, the prize—the Pillette cup, which has to be won twice in succession to become the winner's own property—going to the vehicle which showed the smallest fluctuation, this proving to be De Spirlet's Clement-Bayard, whose time for each of the four trips did not vary more than 8 sec.

The Mont Pilat Hill Climb.

The Automobile Club du Rhone held an interesting hill-climbing competition on Sunday last up Mont Pilat, near St. Etienne, France. The road, which comprises many sharp turns, is five miles long, the average gradient being 7 per cent., or about 1 in 14. The usual categories for touring and racing cars were provided. Rougier, on his Grand Prix Lorraine-Dietrich, repeated his Mont Ventoux victory of the previous Sunday by making the best time of the day, he climbing the hill in 6 min. 20 sec. Bablot, his biggest rival, had, unfortunately, to retire half a mile from the finish owing to the breaking of the clutch of his Brasier. Halut on a Mors was second in 8 min. 51 sec. In the 120-140 mm. cylinder bore racing category Mottard, on a De la Buire, made the climb in 8 min. 16 sec.

International Races for Touring Cars.

Some important resolutions with regard to international races were passed at the recent meeting of the Automobile Club of

Austrian Military Road Trains in Course of Trial on the Semmering Hill.

[Allgemeine Automobil Zeitung.]

der capacity in accordance with the formula. Other categories were formed in the same way. To illustrate the method which was adopted, let it be imagined that twenty entries were received and arranged in the order of the cylinder capacity. Further, supposing that the best time was made by the sixth car, this would be the winner in Class 1, in which the preceding five vehicles would fall. Category 2 would be formed by taking the car showing the best time out of the remaining fourteen. If this were the tenth in the complete list, cars No. 7, 8, 9, and 10 would fall into the second section, the same plan being adopted for the remaining vehicles. Twenty-one cars took part in the event, ranging from a 129.52-h.p. (by formula) Metallurgique to a 34.64-h.p. Clement-Bayard. The best time of the day was made by Moermann on a 104.96-h.p. Mercedes (time, 15 min. 4 2-5 sec.), the Metallurgique referred to above being second in Class 1 in 16 min. 32 1-5 sec. The winners in the other classes were:—Dahmen (100.36-h.p. Opel), 17 min. 8 4-5 sec.; Gregorius (91.8-h.p. Itala), 17 min. 23 sec.; Wilford (44.4-h.p. Germain), 20 min. 11 2-5 sec.; Bourlard (34.6-h.p. Germain), 23 min. 55 1-5 sec.; and De Spirlet (34.6-h.p. Clement-Bayard), 25 min. 8 2-5 sec. The awards as to regularity were also made on a somewhat novel plan. In this section only the winners of the different categories in the speed classification were taken into account. The average time for the hill climb was found by dividing the gross time for the different ascents by four. The difference between the

Italy. It is suggested that, in addition to the annual classic contest for racers, several speed events open to touring cars shall be organised under the regulations of the International Committee of Delegates of National Clubs. With a view of limiting the steadily increasing number of international races, the Club has further suggested that only recognition shall be given to races run on the open road over a minimum distance of 20 kilometres, to be notified in the first quarter of 1908, and in which a guarantee is given as to the technical and sporting organisation arrangements.

Miscellaneous Items.

The motor-car has made its appearance at the Vatican, Cardinal Merry del Val having lately acquired a limousine.—The tenth anniversary of the founding of the Mid-European Motor-car Union is to be celebrated by a banquet in Berlin on October 1st.—A public motor-car service is shortly to be started between Hofheim and Okriftel, near Wiesbaden, Germany.—The Peugeot Company have lately patented a new petrol motor in which the inlet and exhaust valves are of the piston type and actuated by a single cam.—The annual hill-climbing competition at Chateau-Thierry is to be held on Sunday next, the 29th inst. An entry list of nearly sixty vehicles has been obtained, among them being two Napiers.

The Present Position of the French Motor-Car Industry.

(BY A SPECIAL CORRESPONDENT.)

WHEN an industry attains the rank of sixth in importance in relation to a nation's exports, and more especially when this industry is of a mushroom growth, represented by the motor-car trade, conditions and statistics are carefully watched and commented upon both by national economists and by foreign rivals, to discover defensive measures in the one case and weakness and trade possibilities in the other. France now occupies that unenviable position, which has come about by the credit which has attached to the rumours of the past few months regarding the state of its internal market and exterior trade. One by one certain facts have come to light which, culminating, have led people to suppose that there is more than a passing depression to disturb the hitherto strongly marked upward tendency of French trade; but, however keenly the signs of the times have been discounted, there remains little upon

it being of note that very little of this export trade ever returns in like form. For the first time in twenty-five years the value of exports of French produce has exceeded that of the imports, and Frenchmen are drawing comforting conclusions from the fact. Conditions which have been constant for half a decade cannot be considered conclusive, and the present feeling is that, however elated statistical facts may cause the makers to feel, a wave of depression would be brought about if it could be shown that "buds were as scarce as bloom was plentiful." The status of the trade in France is undergoing a serious alteration, for whatever quick changes have come about in past years of the trade history, these changes have been for the better. The present change is not so easily diagnosed, and wears two aspects—the internal trade prospects and the exterior market for French cars and parts. Of the two points of view the exterior

Touring in France.—A Mors Car at the Gate of the Old Castle at Caen.

which to seize as the nucleus of the story of the threatened crisis in the industry. Inasmuch as France has been in the vanguard of European nations in matters concerning the internal combustion motor, quantity and quality, practice and theory being included in the French claim to a grand superiority, it is but natural, so it is said, that the turning point in motor-car industrial progress should likewise see the day amongst the busy factories on the banks of the Seine.

Trade has been dull in France for the whole of the year, and the fact has escaped nobody. But whether this portends a coming crisis, or merely a passing depression, is a searching question, which only a general and critical study of the changeable market conditions can answer. Reference has been made to the exceedingly youthful character of the automobile industry and the high position it has already taken in the wealth of the nation. The most important of French industries is the old-established silk trade; wine exports are fifth on the list, closely followed by the value of automobiles and parts exported, a *bona-fide* figure amounting in 1906 to six million pounds sterling,

trade is by far the more important and fraught with greater danger to French factories; for, whilst the internal trade may be suitably protected, the foreign market cannot, and, moreover, the latter is an ever-increasing factor in the welfare of the French automobile trade.

It is a fairly sound statement that if the special conditions now confronting the trade in France were to affect any other of the leading French industries the word crisis could rightfully be applied, and confidence would be lacking. This is the great difference between the motor-car and other trades. The latter are directed and managed by older established and perhaps less energetic firms than is the youngest of French industries, and a serious change in the market conditions would mean ruin to many. The automobile traders, however, are new to the work, and buckle to with ability and energy to combat rumour and fact, and this factor has to be reckoned with in all essays upon the present trend of affairs in the motor industry.

Dealing first with the internal aspect of the question, upon which volumes might be written and endless debates started it

must be stated that the present position of affairs has been to some extent brought about by the lop-sided growth of foreign trade, which has caused attention to be given to the birds in the bush whilst neglecting those in the hand. The latter, in view of French tariff possibilities, has always been a sure thing for French firms, and only recently has there been the stimulus of competition added to home trade to cause lively bargaining between agents and buyers. The possibilities of home trade are by no means played out, and there remains a deal to be done in order to bring about a healthy trade in France. True, business is slack, but, on the other hand, till recently little has been done towards making trade.

Such has been the ease with which French production has been disposed of in past years, that it is small wonder that competitive tactics have been rather tabooed among the makers in France. It has been impossible to purchase the same car in Paris that has been sold at a given figure in London. This peculiarity is not confined to motor-cars. Many other products of French industry are sold at higher rates at home than abroad, simply by reason of the artificial tariff wall which deadens competition, as the word is understood in Great Britain at least. The above may be said to have held good until the beginning of last year, when another element appeared in the trade, this being the organisation of new works fitted with the most modern machine tools, and devoting their energies towards the production in bulk of one or two models. The effects would have

Mr. A. Lee Guinness at the wheel of his 200-h.p. eight-cylinder Darracq Racer on the Brooklands Track. On the 30th inst. he attained a speed of 115.4 miles per hour, whereupon the car was bought by Mr. Dugald Ross.

been noticed immediately in the swamping of the market and the quick decline of prices at home (for these new firms had not achieved the reputation requisite to build up a large foreign trade), had there not arisen just at that time an enormous demand for chassis designed for town use, and especially for public hiring business, as represented by the taximeter motor-cab. This "taxi" business, as it is familiarly known, caught up every maker who could spare a corner of his shops for the work, and some well-known firms went so far as to build large additions to their factories, where only chassis for motor-cabs have been made. The demand for these vehicles has been almost unlimited, and large orders of almost unprecedented importance have been handled both for Paris and the principal European and American capitals, in addition to smaller orders for large towns. But huge demand brings about a plentiful supply, and the newer firms referred to above, which have grown up, one may say, by the dozen within the past two years, have brought the question of supply and demand to a more normal basis. There is less profit to be made from the construction of chassis for motor-cabs now than there was eighteen months ago, for the reason that prices have declined although the demand is still great. Firms are again turning their attention to their normal output, and it is found that the trade in touring cars has suffered largely within the past year.

The reasons for this are not far to seek. The introduction of taximeter cabs upon the city streets has put off many a customer who, for business or pleasure, had need of a town vehicle; for the hire of a cab, even for several hours daily, has been proved to be less expensive than the keeping of the private car and a chauffeur, not to mention the repair bill, which somehow seems to remain at a constant figure whatever the daily service of the vehicle. Thus professional men, just beginning to consider the acquisition of a light car, have postponed their purchase until vehicles are cheaper than the hire of a motor-cab, a state of affairs which is sure to come about in the long run. The light car business was beginning to be studied with success in France when the taximeter cabs first appeared, and the result has been the falling off of sales of these handy vehicles, a decline in trade which may be considered as relative rather than actual, since the number sold has certainly increased. So much may be said for the light car, which has proved itself an essential adjunct to city life.

The situation is still worse as regards the high-powered car, the 40, 60, and 80-h.p. vehicles which were so wont to be pushed by agents a year or so ago. There is still a demand for these cars, since fashion will have its way, and there are those who do not count cost of upkeep compared to the delight of handling a high-powered machine. These cars were very quickly found quite unsuitable for city work, and of use only for touring and long country trips. With the convincing proof of the capabilities of the 30 or 35-h.p. vehicle, however, as brought to light in the various endurance trials, speed meets, hill-climbing contests, &c., it came to be seen that the uneconomical running of the heavy four and six-cylinder cars was very much out of proportion to the actual advantages of possessing a vehicle capable of doing certainly four or five miles an hour more than the moderate-sized machine, which latter also could easily hold the road at speeds beyond the limit either permitted in tolerant France or compatible with comfortable and safe travel. The doom of the sale of the heavily-powered car was, moreover, more than apparent from the splendid doings of the small-powered car in the Grand Prix and other road contests. The swing of the pendulum rang in the fashion for the handy medium power car.

The number of pleasure cars in France is not so great as may be imagined, and leaving out the hundreds of taximeters which are placed in service monthly, it is certain that seventeen or eighteen thousand cars of more than two seats are all that are in service. Of two-seated cars there may be 3,500. This total is not overwhelming having in mind the size of French factories and the aggregate production. A two mile circle with Puteaux as its centre would include factories capable of producing 500 cars per week. Certain it is that either the demand in France is really small, or the trade is not pushed as it should be. The writer inclines to the latter opinion, and is backed up in the statement by the unprejudiced spirits in the French Automobile Club. It is just here that the export trade affects the interior trade, for, to aggravate the existing conditions, there has been a very marked tendency this present year towards a decline in the exports of complete cars. This aspect of the matter is dealt with later on, but the main result has been that cars which were offered at a premium early in the year in Paris are now sold at a reduction—anything to clear stock before the Salon—which is a month earlier than usual this year. It is not that the makers are full up with stock. They had, for the most part, exclusive contracts with large agencies, and disposed of their 1907 production before the needs of the market were known. The agents, however, have found themselves in a difficult position as regards their contracts, and the fly in the treacle was observable even in 1906 when Brasier cancelled his contract for the disposal of his entire stock to an exclusive agent, and started dealing direct with the public. That makers did not do this before is a proof of the heavy demand and scant supply. In view of the congested conditions of agents' garages, and the hesitation shown by the latter to renew their contracts, makers are now taking the bull by the horns and making arrangements to dispose of their production in the way recognised and practised by all trades except those snugly stowed away in a monopoly.

(To be concluded).

SOME NOTES ON LOSS OF POWER.

WHETHER the car be a four-cylinder high-powered one or merely a 5-h.p. single-cylinder it is equally liable to the indisposition known as loss of power—a form of laziness, if you choose to call it so, but one for which there is always a cause, and this, if diagnosed, can be treated, and, what is more, cured. The causes which bring about loss of power can be considered under three headings:—1, poor compression; 2, poor ignition; 3, poor water circulation.

Poor compression may be due to leakage at either the inlet or exhaust valves, sparking plug, compression chamber, if it be a detachable one, or the piston rings. If a little soap or oil is placed round a suspected joint and the engine started up, escape of bubbles will reveal the position of the leak, and when found it can be remedied. If a sparking plug porcelain is broken, a new plug is necessary; if the inlet valve or plug joint "blows," a new washer is required. Copper and asbestos ones are now made of all sizes and shapes, but failing a suitable one a grommet of asbestos cord rubbed up with a little red lead will always make a gas-tight joint. Inspection will reveal if the valves are true

trembler blade, and with a very fine file dress them so that they are square with one another, then replace, and, with the contact-maker at contact, adjust the trembler to give a good "buzz." If the accumulators are run down, get them re-charged, and if away from home borrow a fresh set. If none can be obtained, it may be possible to get home by adjusting the sparking plug points a little nearer to one another. The usual place where contact trouble occurs is at the contact maker; the fibre wheel may be worn out of truth with the wipe, or the latter may itself be irregularly worn. A new wipe can be fitted, or the old one can be filed true. If the fibre ring is much worn, it will need spinning in the lathe, but on the road the wipe can be usually adjusted so as to get the engine to take one home with a good pull. Often the spring that keeps the wipe in contact merely wants bending or pulling out so as to cause it to press more firmly against the ring. Mud or oil on this part is a frequent cause of stoppage, but occasional cleansing will prevent this. Loose terminals or partly broken wires, too, may be the cause of poor ignition, also imperfect insulation of the leads. The latter at the accumulators often corrode; after attaching them it is well to smear on a little grease, which will prevent the acid, which often slightly escapes, from attacking them. All exposed

Two of the Fiat Cars employed in the Public Service which has lately been established between Schio and Rovereto, Italy.

[L'Automobile.

if not, and they are pitted, they require grinding, so that the valve fits on its seat perfectly. This can be proved by taking out the valve and marking the seat in a few places with chalk, then replace the valve and press it well home. Move it round with a screw-driver, then lift it out, and if the fit is correct it will at once be seen. Gumming of the piston rings may be a cause of their not holding the compression. Pulling the engine round after injecting a little paraffin through the compression cocks is the treatment. Scoring of the cylinder or worn piston rings are the last and, I believe, least frequent causes in this class. The treatment will depend on the extent of the damage; new piston rings may be needed, or if the liner is badly scored it may need relapping, and, if much is so removed, a new piston as well as rings. With proper lubrication, however, a car should run for three or four years on one set of rings, and the cylinder should not require lapping in double that time, but this all depends on proper and sufficient oiling.

Poor ignition may be due to the plug, coil, accumulators or contacts. If the plug is sooted, it should be taken out and cleaned, or a new one put in. If the platinum points on the coil trembler have worn irregularly, remove the screw and

wires should also be well insulated. I believe in putting them through rubber tubing and then lead gas piping, and using tinned copper wire covered with vulcanised rubber; this may be dearer, but it obviates all possibility of a "short."

If the water circulation is imperfect, the engine will heat, the cylinder oil may then burn and the rings, among other possibilities, not hold compression; in addition, the cylinder will be so hot that the gas will expand so much that a full charge cannot enter, and what does, as a result of the excessive heat, will explode prior to full compression, so it is as well to see to the pump and also that the water tank contains water. A few facts about friction pump worries were discussed in the *M.C.J.* of June 15th last, so I will not enter on that question again.

CHARLES T. W. HIRSCH.

THE Newport (Isle of Wight) Town Council is considering the question of securing power to restrict the speed of motor-cars to six miles an hour in the borough, and the surveyor is furnishing information on the subject to the Local Government Board.

THE "YUNEEK" CARBURETTOR.

WE illustrate herewith a new automatic carburettor known as the "Yuneeek," which has lately been put on the market by Messrs. Jas. Adams and Sons, of Union Street, London Bridge, S.E., and which is claimed to give a perfect mixture of air and vapour at all engine speeds. The device, which is designed for use in connection with either petrol or paraffin, comprises a number of interesting features, not the least of which is that by unscrewing a single nut it can be taken entirely to pieces for cleaning purposes. Referring to the drawings, Fig. 1 gives a sectional view of the carburettor as made for use with petrol. As will be seen, the float and spraying chamber are not separate, as usual, but are concentrically arranged. The petrol enters the float chamber A through the pipe B, the outlet to which, as the float rises, is closed by the needle valve shown. The spraying nozzle D, which is connected with A through the elbow piece C, passes up through the closed end of a double-coned tube E, which forms the spraying chamber. A series of slits are formed in the lower portion of the tube E, through which the necessary air for admixture with the sprayed petrol is drawn in. In order to

| J Additional Air Regulator. | |

regulate the air supply at this point a perforated ring G, shown separately in Fig. 3, is provided round the tube, by means of which the slits can be more or less closed as desired.

Attached to and above the float chamber is a special fitting, which forms one of the noteworthy features of the carburettor, as it comprises the branch to which the inlet pipe is attached, an automatic valve H, which allows additional air to be drawn in by suction, in accordance with the requirements of the engine, a hand-controlled rotating valve J, by which the amount of additional air can be adjusted and a piston throttle operated either by hand or foot through suitable connections. The rotating valve J is closed at the top and open at the bottom; in its sides, opposite the extra air and mixture inlet parts, holes are formed of such shape that while the air admission can be more or less contracted, a full passage is always ensured for the mixture, the regulation of the supply of the gas being entirely performed by the piston throttle. The latter is also so arranged that when the car is running down hill the mixture

can be entirely cut off, and a blast of cold air drawn into the engine straight through the valve H, in this way not only cooling it but effecting a considerable economy in fuel. In fact, one of the claims made for the new carburettor is that it effects a saving in petrol of at least 25 per cent. A screw is provided below the needle valve to enable any deposit to be readily removed, a similar fitting being located below the spraying nozzle, which permits the latter to be cleared of any obstruction without it being necessary to remove it from the tube E.

So far we have dealt with the carburettor as arranged for use in connection with petrol; to adapt it to work with paraffin it is only necessary to add to the inlet port O the fitting shown in section separately in Fig. 2. This comprises a heating chamber P, through which part of the exhaust gases are caused to pass, by means of pipes attached at R and S. In the centre is a nickel tube Q, made in the form of a screw in order to increase the heating surface over which the mixture passes ere it enters the explosion chamber of the engine. The makers claim that by heating up the tube Q for a few minutes by means of a lamp, the flame of which is introduced at T, the engine can be put in operation directly on paraffin, no petrol being necessary, and that, owing to the complete combustion, there is no objectionable smell nor dirty exhaust. The carburettor is being made in two sizes—one for engines up to 20-h.p. and one for those from 20 to 100-h.p., the form of the spraying tube being varied to suit different powered engines, the one we examined drawing its initial air supply not through slits F at the side, but through holes in the bottom of the tube E.

AN ACCIDENT IN THE HIGHLANDS.

THE dangers of motoring in the Highlands have been fully revealed to the participants in the Reliability Trials organised in past years by the Scottish Automobile Club; they receive new emphasis from the regrettable accident which occurred a few days ago on the Glen Affric road, in Inverness-shire. Lord Tweedmouth had lent his car to the house staff at Guisachan (lately acquired by Lord Portsmouth from Lord Tweedmouth) to visit friends at Affric. They had to travel over one of the worst pieces of road in the Highlands. It is only 8 ft. 6 in. in width, the angles in it are sharp and difficult to negotiate, and the surface is by no means satisfactory. The party were being conveyed back to Guisachan in two journeys, and one half were safely landed there by the chauffeur. The others, after waiting for the car to return, set out to walk to meet it. When it arrived the chauffeur could not turn the car in the narrow road, and had to go on a mile and a half. Mr. Hancock and Mr. Unwin stepped in, while the ladies decided to continue their walk until overtaken by the car. The most dangerous part of the road was negotiated in safety, and the car turned and started on the final run to Guisachan. It was going at a fair speed, and when running uphill and taking a very sharp curve to the left the right front wheel went slightly off the roadway and, unnoticed, got on the outside of a strip of sharp rock. The car kept running, and the rock pulled its head over the embankment. The rear part swung down, and the car tumbled on its side and lay on the rocky bank, about twelve yards from the road. Mr. Unwin, who had been sitting beside the chauffeur, was caught beneath the vehicle and was killed instantaneously. Mr. Hancock and the chauffeur were thrown clear of the car, and both received injuries, but not of a serious nature. Too great care cannot be exercised when driving along such narrow roads.

THE local authorities controlling the district of Hammsmith, Twickenham, Ealing, Hampton Wick, Hanwell, and Teddington, through which the trams of the London United Tramways, Ltd., run, are considering the question of applying for an injunction restraining the company from running their cars, should they fail to comply with a notice to abate a nuisance which has been served upon them. Teddington has taken the lead in the matter. It estimates its losses from the depreciation of house property since the advent of the trams at £30,000, and another £30,000 for loss on empty houses.

IN addition to a motor ambulance an Argyll Motor Fire Brigade tender is being supplied to the Corporation of Sheffield.

IN his report on the recent army manoeuvres in Ireland General Lord Grenfell says the value of the Army Motor Reserve was fully exemplified during the operations.

MESSRS. WILSON AND STOCKALL, LTD., of Bury, are building an ambulance body for a Panhard chassis which has been acquired for the borough of Swansea.

A NEW garage has been opened in the Bridge End Road at Nairn by Messrs. Knowles and Cumming.

CARS are being let on hire by Messrs. Sutton Brothers, who have a garage in Lower Oxford Street, Swansea, where they also have plant for general motor repair work.

WE learn that Mr. Andrew Fletcher of Saltoun has bought the 60-h.p. De Dietrich car which was driven by Mr. Charles Jarrott in the famous dead heat on the Brooklands Track. Mr. Fletcher is having a handsome Roi de Belges body fitted to the vehicle, which will in future be used for touring purposes.

THE Automobile Association is appealing for subscriptions on behalf of the costs incurred by Mr. Joseph Taylor in connection with the freeing of Maidenhead Bridge from tolls. It has headed the list with twenty guineas, and motorists generally should show their appreciation of Mr. Taylor's endeavours to lessen the inconveniences of the roads.

ON Tuesday, at Prescott, Thomas Gregson, a master baker, of Lymm, was fined 40s. and costs for being drunk while in charge of a motor-car; for not producing his licence he was fined 20s. and costs; and for reckless driving he was fined £5 and costs, while his licence was suspended until it expired in February next. It was stated that the defendant had been convicted on five occasions for being drunk and driving recklessly with motor-cars, and he had had his licence suspended for six months.

MR. PERCY RICHARDSON, who left London for Sheffield some months ago, has called attention to the absence of warnings at many points of the Derbyshire highways where they should be put up with a view to averting accidents. Experience has led him to contrast the excellent way in which the roads in South Yorkshire are covered in this respect by the responsible authorities, and we would associate ourselves with his hope that those responsible in Derbyshire may be equally alive to their duties to the public.

MESSRS. HALL, CAPRIS AND CO., LTD., of Riding House Street, Langham Place, London, W., the British agents for the S.P.A. cars, send us particulars of a new self-starting device for petrol cars they are introducing. The arrangement, which is known as the "Universal," consists of a small dynamo that can be fitted on all cars, the only modification necessary in the motor being in providing the fly-wheel with a light toothed crown or rim. In addition to its use for automatically starting the motor, the dynamo can be used to furnish current for ignition purposes, for the illumination of the vehicle, the electrical heating of the steering wheel, &c.

THE claims of a large number of competitors in connection with the August section of the competitions promoted by Argyll Motors, Ltd., have been considered by the judges, who have agreed that the trophy should be awarded to Mr. J. W. Schofield, of Dean House, Uxbridge Road, Ealing. This gentleman owns a 10-12-h.p. Argyll three years of age, which has already, according to the Smith speedometer, covered over 30,000 miles. During the bad weather in the early days of August it carried a heavy limousine body, 2½ cwt. of luggage, and five passengers over 2,000 miles through the hilliest districts of France and Devonshire without a single mechanical mishap or adjustment in fourteen days. Other competitors honourably mentioned by the judges were Mrs. Senhouse, of Cockermouth; Messrs. Hermon Sykes, of Huddersfield; A. A. Jones, of Swansea; E. R. Prince, of Queen's Park; A. Alexander, of Kensington; Hugh Conybeare, of Ingatestone; Thomas Whaley, London; and T. A. Hall, of Leeds.

ACCORDING to the County Court judge at Bishop's Stortford, motor-cars are ruining the country and revolutionising society.

THE secretary of the Motor Union is now the possessor of an 8-h.p. Rover car to be used in connection with his official duties.

MR. E. A. TOMKIN, 53, Cross Street, Abergavenny, is stocking motor accessories, petrol, &c., and is also undertaking motor repair work.

ANTI-MOTORISTS in Paris are spreading a rumour that the trees lining the famous Champs Elysées are being killed by the exhaust of the numerous motor-cars which travel along that thoroughfare.

A NUMBER of motor volunteers are being employed in connection with the military manoeuvres at present being carried out in Spain.

IN one of the four cases heard at the Carlisle bench on Saturday the motorist had taken the precaution of photographing the constable into whose trap he had fallen. The production of this evidence of identification amused the court, though it did not lead to a mitigation of the fine.

CALLING in at the depot of Messrs. Sternberg and Eason, in Poland Street, London, W., the other day, we had an opportunity of inspecting the new 24-h.p. Buick car. As will be seen from the photograph reproduced herewith, it is fitted with a very smart three-seated body, which, although built in America by

the Buick Co., is on the latest French lines. The engine is of the four-cylinder vertical type, the change-speed gear, which is of the usual sliding type, giving three forward speeds and a reverse. The car is extremely silent, and will climb most hills on top speed.

THE funeral of Mr. H. V. Hermon, whose fatal accident on the Brooklands track has elicited much sympathy with his relatives, took place at Wargrave, near Reading, on Thursday week, when wreaths of floral tributes were sent by many friends, including Sir R. T. Hermon-Hodge, Mr. and Mrs. Moore-Brabazon, Mr. and Mrs. Locke-King and the Committees of the R.A.C., the Brooklands A.R.C., the Automobile Association and the Motor Club.

MESSRS. J. M. DENT AND CO. have issued a little work, "Romantic Essex," by Mr. R. A. Beckett, which will be of interest to all who tour that county by car. Unfortunately for the hostellers of Essex the road from London lies through the drab and dreary district of East London, and not until the suburbs of Forest Gate and beyond are left does the highway become tolerable. But once at Brentwood and rambling around Chelmsford, Colchester, Braintree, Maldon, and other less known places, the county is full of historic interest, and not lacking in rural beauty—as Mr. R. A. Beckett pleasantly proves.

D

THE accompanying illustration represents the accumulator charging plant recently installed in the Daimler Company's Works at Coventry by Messrs. C. A. Vandervell and Co., of Acton Vale, W., who make a feature of supplying and fitting up complete charging plants of any capacity. The switch board measures 11 ft. by 3 ft., and has, mounted at the back of it, a field rheostat for the dynamo, with hand wheel in front. A reverse cut-out is fitted, to prevent the accumulators discharging through the dynamo in the event of the latter accidentally stopping. The main ammeter and voltmeter are 9 in. in diameter, and of the dead-beat moving-coil type, reading up to 175 amps. and 75 volts respectively, while there are 20 ammeters

of 6 in. diameter to the charging circuit. The resistances are fitted in separate porcelain units for each step and may be easily replaced. There are double-pole main switches and fuses, with a safety fuse to each circuit. The dynamo is capable of a normal output of 70 volts 160 amps. continuously. It is possible to charge at one time 275 "C.A.V." accumulators of 100 amps. 4 volts, the normal rate being 7 amps., with a possible maximum of 10 amps. If necessary, the dynamo runs at 960 r.p.m., and is coupled direct to one of the Coventry Corporation's 15-h.p. motors. We believe, so far as motor factories or garages in Great Britain are concerned, that the installation is unique.

MR. A. F. WALLACE, a director of the Bank of England, has lately acquired a 14-16-h.p. Argyll car.

RUSHMORE LAMPS, LTD., have recently fitted Rushmore headlights to Princess Henry of Battenburg's 40-h.p. Daimler car.

AN offer of £2,000 to be utilised as prizes for the promotion of the use of alcohol for motor and industrial purposes has been made to the Motor Union by Peat Industries, Ltd.

DR. H. S. HELE-SHAW is the chairman of the Standing Committee of the Motor Union formed to watch new developments in connection with the fuel supply for automobiles.

WE had an interesting conversation a few days ago with a visitor from Toronto, and we were glad to learn that the automobile movement is making good progress in Canada, and that British-built cars are growing in favour.

A MOTOR lifeboat ran some trials on Saturday from Yarmouth with the Lifeboat Institution's local officials on board. She made up to eight knots an hour. The boat is destined for service at Seaton Carew, on the north-east seaboard.

THE latest departure of Elastes, Ltd., is the introduction of a moveable flange rim by means of which Elastes filled tyres can not only be fixed in position without in any way straining the cover, but the latter when worn can be removed, the Elastes boyau withdrawn and placed in a new cover and replaced in position without difficulty and in a short space of time. We hope to deal with the new rim more fully in a later issue.

SIGNOR MARCONI, of wireless telegraphy fame, has lately acquired a Fiat 40-h.p. four-cylinder car.

AMONG the latest orders for Crossley cars received by Messrs. Jarrott and Letts are one for a 30-h.p. car for Lord Alwyne Compton and a limousine for Mr. A. Barclay-Walker.

THE showrooms of the Bristol Wagon and Carriage Works Company, Ltd., at Lawrence Hill have recently been enlarged for the convenience of the motor department of the company, which now finds employment for 1,000 people.

MANN'S PATENT STEAM CART AND WAGON COMPANY, LTD., of Hunslet, Leeds, have lately completed a novel confectioners' van, to the order of Mr. W. T. Davies, Cobden Steam Confectionery Works, Pontypridd, to be used for advertising purposes as well as carrying goods. The vehicle is of the firm's two-ton size designed for a speed of eight miles per hour.

VOLUME III. of the Automobile Technical Library, published by M. Krahn's Verlagsbuchhandlung, Berlin, is devoted to carburettors. It is from the pen of Herr H. Dechamps, and contains illustrated descriptions of all the principal carburetting devices at present in use. Although printed in German, the work is one which should prove valuable to automobile engineers.

WE learn that Mr. John E. Gibbs, managing director of John E. Gibbs and Maclean, Ltd., of Fawcett Street, York, has during the last three years made a number of very interesting experiments in connection with superheated steam. There are many steam cars, especially those of the Gardner-Serpollet type, which have been laid on one side from some little defect or other, which, of course, seriously affects the running of the vehicles, and has made them practically of no use, but the many experiments that Mr. Gibbs has made and the results which he has been able to obtain have so far proved that the several troubles which arise in connection with these machines can be easily overcome.

MESSRS. JAMES NEALE AND SONS, of Graham Street, Birmingham, the manufacturers of the Radyot wind screen, are placing on the market an improved type of screen. The chief feature of the new design is a metal frame in place of wood. To prevent noise and jarring the glass is embedded in rubber and felt, which constitutes a very satisfactory cushion. The metal frame gives a showy and very light appearance. The joint of

this screen has also been improved, all the wearing parts being now made of steel. Four different positions or angles can be obtained by manipulating this joint, and there is perfect rigidity at each one. These metal screens are finished in either brass or nickel, and some idea of their general appearance will be gleaned from our illustration.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

THE SPORTING SIDE OF MOTORING.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been taking careful notice during the past year of the events—hill-climbing and speed—held by the various automobile clubs throughout the United Kingdom. With very few exceptions success has attended the effort of each club to provide sport and amusement for its members.

It would be impossible at the present time to predict the future of club life in connection with the sporting side of automobilism, but there exist to-day a large number of excellent clubs with active committees, doing much to popularise motoring in this country. It cannot be gainsaid that the success of these clubs depends in a large manner on the "camaraderie" existing between the members. Therefore hill-climbs, speed events, gymkhanas, &c., confined to the local club's members are of real value because of the opportunities they give for the members to

chance has a private member against a trade member having a fleet of special vehicles at his command? This sort of thing has been going on for some time past, but I think that things came to a climax during the past season, and it is foolish to expect that the *bona-fide* sporting club members will stand it much longer, as nothing is more likely to kill the success of club events than to have trade interlopers running down from London to scoop up the prizes.

I am not suggesting that trade members should not be admitted to club membership; on the contrary, I think that the energy and enthusiasm of the local trade members in connection with some clubs has much to do with their success, but, to prevent the abuse I have mentioned on the part of big trading concerns, it would be far better that some special rules should be passed by every automobile club in the country.

Firstly, that every car entered in a members' event should be his

One of the N.A.G. (Chars-a-banous) service in Alexandria, Egypt.

meet and to know each other. During 1907 the members of the various clubs have loyally supported their own club's events, and some of the keenest racing of the year has been witnessed in these closed races.

In this connection it would appear to the advantage of the trade that everything should be done to encourage these club events, and the friendly rivalry between the members, and I must say that on the whole this has been recognised. This fact, however, brings out the more prominently the action of certain traders who have joined a large number of the provincial clubs all over the country solely and entirely for the purpose of taking part in, and winning, these closed club events, primarily arranged for the benefit of bona-fide members. These "pot-hunters" having all the advantages and facilities of being in the trade, take part in, and compete, not for the sport or the pleasure of it, but merely to enable them to make use of a victory for the purposes of a trade advertisement. In some cases the principal member of the firm has not joined the club, but has substituted a subordinate, and, in spite of the rule properly passed by some clubs to the effect that the car of each competing member must be his own personal property, the firm's special car has been trotted out, to the discomfiture and chagrin of the private members taking part; not only this, but in some instances one of the professional drivers of the firm has driven the car in the club competition, posing, I assume, as the member's driver.

Undue credit is given in these events to the fastest time, and what

own personal property. Secondly, either bar all members connected directly or indirectly with the trade from competing, or, as an alternative confine the entries for each club event to members residing within, say, twenty-five miles from the club's headquarters, or actually resident in the county. The latter rule might place some of the private members under the ban, but this would be a case of the smaller suffering for the benefit of the greater.

Anyone studying the list of results of club events during the past year will immediately appreciate how necessary it is that something should be done. The result would be an increased interest on the part of members in club events and keener racing. A better feeling would prevail and a more appreciative interest in the club's welfare would follow, whilst the only sufferers would be those members of the trade to whom the law of fairness counts nothing, but whose actions are based, not upon the spirit, but the strict letter of the law.—Yours truly,

CHAS. JARROTT.

REAR LIGHTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being a constant reader of your valued paper, I take the opportunity of asking you for a little advice. I was entering a town in Lancashire recently, and intended to stop at the hotel there. About

ten yards before reaching the hotel I heard a police whistle go, and when I pulled up a sergeant and constable approached and informed me that my rear lamp was out. I was not aware of the fact, and told them so.

He stepped to the back of the car and said the lamp was cold, thereby inferring that the lamp had been out a considerable time. After giving all particulars I resumed my journey. The result is a summons. Now I should like to know if the magistrates have the power to endorse my licence for this offence, as I have got the idea that they cannot do so. I should be pleased if you will furnish me with the above information.—Yours truly,

MOTOR MECHANIC.

[We deal with this point in our "Comments" on another page.]

RACING AT BROOKLANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have seen photographs in the papers this week showing the condition of the wheel of the Napier car which succeeded in getting over the finishing line first in the race in which Mr. Hermon was unfortunately killed. As most of the spokes are out it is to my mind a marvel that the whole thing did not collapse entirely prior to the finish of the race, when being driven at such a high speed. Surely if the Napier driver had no regard for his own neck, in common fairness to the other competitors he should have stopped.

I should like to ask what would have happened had the wheel in question collapsed entirely prior to the finish. The probability would have been that half-a-dozen cars would have been smashed up. This form of reckless driving ought not to be allowed where lives of other men are jeopardised.—Yours truly,

SPECTATOR.

Probably the Motor-car has never served a more worthy purpose than when Messrs. Argylls Hull, Ltd., inaugurated a Motor Outing for the Crippled Children of Hull. A fleet of twenty-one cars, mostly "Argylls," as shown in the photograph reproduced above, conveyed the children into the country, where a delightful day was spent.

TYRE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been very interested in reading the correspondence appearing under above heading, and have noted the unfortunate experiences of "Galen" as detailed by him in the last week's issue. "Galen" raises the question of the heating which takes place in motor covers in a very interesting way, but I think that this question is very much misunderstood. Many motorists consider that heating takes place as the result of road friction. This is not so, the chief cause of heating being due to the friction of the strands of which the canvas fabric of the tyre is composed. Another cause is that, owing to the work which is done by the air inside the tube, it of necessity gets hot during a run. It is common knowledge that a skilful blacksmith by hammering a piece of iron on an anvil can make it a dull red heat, and when one considers the number of concussions or shocks which have to be absorbed by the air in a motor tube, it is not surprising that a very great amount of heat is generated from this source.

I think that the fact that heat is principally generated inside the tyre can be fairly well established, and it is undoubtedly a very great cause of damage to covers. The leather non-skid band which completely envelops the cover prevents the radiation of the internally generated heat, and consequently, during a non-stop run of say thirty to fifty miles, allows the cover to get much hotter than anything which is made of extremely perishable substance, as canvas and rubber, should. Non-skids are undoubtedly a necessity, and a type should be chosen much the same as one with which the writer's firm is identified, consisting of studs

built into a rubber and canvas fabric on the tread of the tyre. A non-skid on these lines, instead of tending to heat the cover, really makes it much cooler than the ordinary tyre owing to the fact that the shanks of the rivets penetrate right into the body of the cover and absorbing the heat there radiate it from their outer surfaces. Leather bands are very successful in certain cases, such as one in which it is advisable not to subject a cover to further vulcanisation, but there is no doubt that, owing to the leather being a non-conductor of heat, many instances such as that described by "Galen" are caused. It is rather difficult to say that is the cause of the trouble he has experienced, as from his description it is quite possible that the cover was improperly fitted. It is impossible for a tube which has only been run two miles, and is brand new, to burst with ordinary use in the manner described.—Yours truly,

GEORGE A. ROBERTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "Galen's" letter in your issue of 21st inst., I have had two bursts and one blow out inside of a week when using studded covers. I sent the tyres to be re-treaded and repaired by the Acme Rubber and Tyre Company, in Glasgow, putting them on with flaked graphite instead of using French chalk. I have had them on for about fifteen days, and have travelled 1,265 miles over some of the worst roads in Scotland, viz., Glenshee, Braemar and Grampians. I would suggest that for his size of tyre your correspondent should use a band separate from the cover on the rear wheels. I am in no way connected with any tyre firm, but will write you later as to the actual mileage run on these two tyres when they are unserviceable.—Yours truly,

GRAPHITE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. Bishop's inquiry in a recent issue of the *M.C.J.* there are several makes of American single tube tyres that will permit of being driven deflated for some distance, but, on account of the method of repair not being popular in this country, they are seldom used here. The "Goodrich," "Goodyear," and "Collier" (old pattern), are types that your correspondent might investigate with advantage. To fill the tyre with any composition, either solid or semi-solid, will of course render it heavy and decrease the speed and resiliency, besides the risk of having flat places develop, if the tyre is left standing long with a weight on it. The wear and tear on the tread would also be greater than with an air-filled chamber. "Miraculum" appears to be a good thing; this is a liquid which is claimed to stop risk of punctures, and probably some of this injected in a good strong single tube tyre might suit Mr. Bishop. A larger diameter tyre would also help matters a lot, if there is room for it. In any case an 80 mm. tyre can be fitted instead of the 75 mm. on the same rim.—Yours truly,

C. A. E.

MAGISTERIAL TREATMENT OF A MOTORIST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly allow me through your valuable paper to state the disgraceful way I have been treated? On Monday last, at Enfield, I was summoned for driving my car without a front light. It had just gone out when I was stopped. I was sentenced to pay a fine of 26s. I had not the money with me. I was put in the cells for seven hours along with a lot of prisoners, some of whom were absolutely dirty, waiting to go to prison for twenty-one days. Through the kindness of our inspector, Mr. Twigg, I was allowed twenty-one days in which to pay my fine. I may say I have had eleven years' experience and have not a single accident recorded against me. The magistrates have made my licence very nearly useless through endorsements. I think that something ought to be done for our protection, for the police seem to do as they like with us.—Yours truly,

A MOTORIST.

MOTOR BODY DESIGN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have been much interested in the reports of the meeting of the Institute of British Carriage Manufacturers. Though we are carriage builders ourselves, we are not members of the Institute, and therefore are unable to take any part in the proceedings. We notice that Sir William Angus is very hopeful that motor-cars will receive a set-back in favour of horse-drawn carriages, because the motor-car could not meet the desire of ladies for elegance and for possibilities of display. Doubtless Sir William is quite right in supposing that some sort of town carriage which will have an extremely elegant appearance, and which will permit of ladies driving in them, dressed in the same fashionable manner as when they drive in their victorias, is an absolute necessity, but we think he is quite wrong in supposing that the motor-car manufacturers cannot adapt themselves to this need. In our opinion they will certainly produce the type of carriage required as the necessity for it becomes more obvious. As a matter of fact we ourselves have built victorias which are, as nearly as possible, copies of the horse drawn victorias. Our own type of chassis is peculiarly suitable for

this kind of body, as we are able to get the body completely within the wheels and give the same convenience for getting in and out as was obtained with the horse-drawn carriage.

We at the present moment have in hand a 30-h.p. car fitted with a victoria body, and this is not for a lady, but for a gentleman who happens to prefer that type of carriage, but it scarcely seems that there can ever be much market for very powerful and consequently very expensive cars fitted with bodies which are only suitable for a rather limited amount of work. The victoria is undoubtedly an ideal carriage for park use, for afternoon runs out into the country, for paying calls and for the general purposes for which a lady usually requires her carriage, but it is very doubtful whether anyone would choose it for touring. In our opinion something like 20-h.p. is the correct power for such a car. It is then light and easy to handle, the upkeep is cheap, and the car can be turned out at a reasonable figure, even with the very highest class finish and the most elegant body work. It then becomes quite possible for owners of moderate wealth to have, beside their big all-round touring car, a couple of small cars, one a landaulet and the other a victoria, so that they are fully equipped for all types of driving, just as was usual in the days of the horse carriage.—Yours truly,

J. C. MORT, Director.
New Engine (Motor) Co., Ltd.

COIL TROUBLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Our attention has been drawn to a letter over the signature T. Beverley in your impression of September 7th, in which your correspondent states that he has had trouble owing to the points pitting, &c. In your footnote you give him some practical advice, but apparently you are unacquainted with the existence of this company, which has been formed in this country for the purpose of selling the productions of the Société d'Electricité Nilmelior, lately known as Messrs. Basse-Michel.

If Mr. Beverley will send his coil to us, we shall be only too pleased to examine same, and let him know where the trouble lies. Until we have examined the coil, we would prefer to make no further comment beyond stating that as far as we can ascertain the particular coil referred to would be manufactured somewhere about four years ago, and doubtless in that time it has passed through various hands. Incidentally, we might mention that up to the present the Société has manufactured some 635,000 coils, and may therefore claim to know something of the subject, and to be in a position to turn out nothing but first-class work.—Yours truly,

NILMELIOR (ENGLAND) LTD.

WHY MOTORS LOSE POWER.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice from time to time that correspondents write complaining of loss of power in their engines. As a motor driver I am surprised that the majority of cars show as much power as they do. You meet motor drivers occasionally who take a pride in keeping the power of their engines up to where it ought to be, but by far the greater class seem to be thoroughly satisfied if the car runs at all. There are three great causes for loss of power in a petrol motor. Probably the most serious offender is the lack of compression. The valves should be carefully ground in and care should be taken that there are no leaks either around the sparking plugs or the valve caps. The ignition is also usually carelessly taken care of, and it is a fact that the intensity of the electric spark is a most important factor if the motor is to develop its full power. A third and last cause is improper mixture of the petrol and air; or, in other words, the carburettor should be properly adjusted. There are, of course, several factors that enter into each of the above three general causes, but it can be taken as an axiom that when the compression, the electric system, and the carburettor are all in proper condition, the motor will show up its full power.—Yours truly,

OLD HAND.

WHEELS FOR MOTOR-CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 7th inst. there is a letter from Mr. O. Cook, advertising to one from us in the *M.C.J.* issue of the 31st ult. The various advantages which Mr. Cook demands in a new tyre, viz., unpuncturability, reasonable cost, non-skidding without destruction of roads, no necessity to carry spares, all these and more are conferred by the "K.T." tyre. Mr. Cook states that "where there is an air cushion on the edge of the wheel there must be a tendency to roll, which is an important factor to side-slips." I would point out to Mr. Cook that the question of rolling depends even more on the balance and height from the ground of a chassis and its body than on the tyres, but that, in any case, a vehicle shod with pneumatic tyres on the periphery of the rim rolls less than a vehicle with any other method of tyreing; that a vehicle with steel wheels propelled on the road at any pace above twenty miles an hour becomes almost unmanageable from rolling; that an ordinary solid rubber-tyred vehicle at thirty miles an hour is a positive danger from this cause; and that on any decently designed car fitted with pneumatics, there should be no tendency whatever to roll at any speed

below forty miles an hour, which I think all fair-minded men will agree is quite a sufficient speed for use on our present day roads.

It is a fact so well known to engineers that the only correct place to absorb vibration is on the outer circumference of the wheel, and that the only conceivable means of absorbing vibration as well as road shocks is to be obtained by a combination of rubber and air, that I need hardly enter into any controversy as to the merits or demerits of devices calculated to absorb the vibration at the hub instead of the outer circumference of the wheel.—Yours truly,

A. ERNEST GELDER.
The K.T. Syndicate, Ltd.

ARE SPEEDOMETERS USEFUL?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the now general adoption of speedometers on motor-cars, it would be interesting to learn whether their use has had any effect on the way vehicles fitted with them are usually driven. The use of such instruments, of course, prevents the danger of unconsciously exceeding any given speed, and thus enables the driver who is desirous of observing the speed limit to do so. On the other hand, the driver who is trying to attain high speeds is ever attempting to urge the index of his instrument to a higher figure. It is probable, however, that the motorist who is out for speed will drive his car at its maximum rate, speedometer or no speedometer. One thing is certain, that with a car equipped with a speed-indicating device, all excuses as to ignorance of the rate at which the vehicle was travelling become invalid.—Yours truly,

BERKSHIRE.

Mr. Henry Dubs, of Cloncaird, Maybole, Ayrshire, at the wheel of the 80-h.p. De Dietrich Touring Car of which he has just taken delivery.

The car is fitted with a specially rakish side-entrance body, to hold five passengers. The rear seat is very low, so that the passengers at the back are sheltered from the wind. Equal sized wheels are fitted to take 935 by 135 tyres.

EXCESSIVE PETROL CONSUMPTION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being a constant reader of the valuable articles in the *M.C.J.*, and advice in the past to motorists on practical points, I should esteem it a favour if you would give me some information on the following matter. I run a 6-h.p. De Dion two-seater, and find the carburettor (De Dion) consumes a terrible amount of petrol for the mixture; something like one gallon for only sixteen miles. I have adjusted the spray jet several times but this has been of no practical use.—Yours truly,

F. P.

[There must be something very much out of adjustment for this little car to consume a gallon of petrol in sixteen miles, as no less than thirty to forty miles can be got out of them for this amount. It is probable that the nose of the needle valve, either by wear or improper grinding, has worn a ridge round it, on which it sits. This will cause an undue amount to be sprayed when it lifts. The remedy is to have the nose skimmed up true, and then the length carefully readjusted by the set screw provided for regulating the same. It is possible, of course, that someone has reamed out the hole the needle valve sits on beyond the standard diameter, in which case a new jet must be obtained, as no amount of adjusting or grinding in will serve if it has been spoilt in this way. Another possibility is that the float has been punctured and let in some petrol, but in this case our correspondent would be troubled with flooding when the engine stops unless the tap is turned off.]

CLUBS AND ASSOCIATIONS.

THE AUTOMOBILE ASSOCIATION.

On Monday the inaugural dinner in connection with the Northern Offices of the Automobile Association in 30, Cross Street, Manchester, was held at the Midland Hotel, Manchester. Col. W. J. Bosworth was in the chair, supported by most of the members of the committee, who had travelled especially from London to be present, as well as by many of the leading officers of northern clubs, including Messrs. J. H. Baldwin, J.P. (chairman Halifax A.C.), W. Birtwistle (president North East Lancashire A.C.), J. Fraser (hon. sec. Manchester M.C.), A. G. Jeans (chairman Cheshire A.C.), J. A. Morris (president Manchester A.C.), J. Porter (Blackpool and Flyde A.C.), D. N. Mackay (northern manager A.A.) and Stenson Cooke (secretary).

The loyal toast having been enthusiastically honoured, Mr. W. E. Rowcliffe proposed "The Automobile Association." He said the advantages to be derived from joining this body were entirely dissimilar to and the policy divergent from those of either the Motor Union or the Royal Automobile Club, and therefore there was no reason why these bodies should be in the slightest degree at variance. He regretted there should have been any misunderstanding between the Motor Union and the Automobile Association. It was, however, very gratifying that there was a prospect of a settlement of these differences in the near future. He trusted that a "modus vivendi" would be found to remove any unnecessary competition between the two associations, particularly

Robert Peacock, Chief Constable of Manchester, who was unable to be present. Last week, he said, an application was made by a gentleman to introduce a motor service to link up the Manchester suburbs, but the report of the Chief Constable and City Surveyor was unfavourable, though the same type of motor had been used by the Scotland Yard authorities.

NOTTINGHAMSHIRE.

On Saturday, the Nottinghamshire Automobile Club held a hill climbing competition at Hazlewood Hill, between Duffield and Belper. The arrangements were of the usual excellent character associated with the organisation of events by this very successful club, of which Mr. Booth Granger is hon. sec., and the hill afforded a capital venue for the trial. It has an average gradient of one in eight, being considerably steeper in some places.

The cars were divided into three classes, viz., not exceeding 15-h.p., not exceeding 30-h.p., and exceeding 30-h.p. In Class A there were two entries, in Class B eight, and Class C nine. The results were decided by the Royal A.C., on whose behalf Captain Bagnall Wild was present as handicapper. In each class there was a first prize value 2 gs., second prize of £1 1s., but the conditions prohibited the latter prizes being awarded unless there were six starters, so that these were withheld in respect of the 15-h.p. and not exceeding 30-h.p.

The Nottingham Automobile Club's Hill Climbing Competition.—Dr. Hogarth on his 12-16-h.p. Talbot, the winner of the Hardy Cup.

n view of the Parliamentary fight in motoring legislation, which in future would be far more severe than in the past.

The Chairman, Col. W. J. Bosworth, in responding, referred to the difference with the Motor Union, and said that when an invader came into their territory and collared a few of their cities he thought that could hardly in fairness be called "a holding out of the olive branch." He hoped, however, that those differences would be arranged. It was Mr. Jarrett who was the first to entertain the idea that they should have scouts on the roads. After two years' work they had succeeded in making the roads fairly comfortable round London, and now they wanted to do the same in such an industrial city as Manchester.

Mr. S. F. Edge, in proposing "The Northern Branch of the Automobile Association," said he felt the branch ought to have been formed in the early days. He emphasised the importance of covering the roads of Great Britain with scouts, who gave all motorists a certain comfort and freedom from annoyance. There was no association in which the small annual subscription of two guineas ensured more to the pleasure of the motorist. Members interested in the motor business, he added, had nothing to gain by working in such an association.

After Mr. S. Norris replied, Mr. Walter Payne proposed "The City of Manchester." Councillor H. Ross Clynes replied in the place of Mr.

cars. There was also the Hardy Challenge Cup, which is taken by the owner, for the best performance on the handicap, a miniature replica of which was provided by Mr. A. N. Lee. Dr. Hogarth, who was the organiser of the meeting, gave a prize for the fastest time.

Each car started dead from a mark. In a little over half an hour Classes A and B were run off. Then a little delay occurred through vehicular traffic. Afterwards the proceedings went on apace, and shortly after four the officials were able to announce the result of the hill-climbing competitions. Some remarkably good times were made, the best being 72.4 seconds, and the worst 185 seconds. The details were:—

Name.	Car.	R.A.C. Rating.	Time. Sec.	Rel. Eff.	Prize.
CLASS A.					
1. Victor Riley	12 h.p. Riley	12.4-h.p.	114	67.9	1st.
2. A. King	9-11-h.p. Swift	12.8-h.p.	185	40.0	—
CLASS B.					
3. Dr. R. G. Hogarth	12-16-h.p. Talbot	17.9-h.p.	115	77.0	Barred.
5. Dr. P. Tre-sider	15-h.p. Talbot	20.1-h.p.	120	72.1	1st.
7. Mr. Ross Browne	15-h.p. Mas	22.3-h.p.	128	55.4	—
8. P. Graham	24-h.p. Deasy	27.6-h.p.	99	70.3	—
10. J. Wilson	20-30-h.p. Humber	30-h.p.	117.3	47.6	—

Name.	Car.	R.A.C. Rating.	Time. Rel. Sec.	Prize.
CLASS C.				
14. P. L. Huskinson ...	30-h.p. Daimler	41-9-h.p.	77-2 67-5	1st.
12. R. M. Wright ...	28-h.p. Daimler	35-7-h.p.	100-0 81-1	2nd.
11. H. Belcher ...	30-h.p. Humber	35-7-h.p.	125-0 40-0	—

18. C. Hardy ...	45-h.p. Daimler	55-8-h.p.	75-8 56-1	—

The Hardy Cup was won by Dr. R. G. Hogarth and the prize for fastest time by Mr. F. A. Bolton.

In class B Dr. Tressider took the first prize. Dr. Hogarth being barred in consequence of his capturing the Hardy Cup.

The most interesting races of the day were the "special heat competitions." The handicap was so framed that each car was called upon to do its best if it was to win. The cars were run in pairs, and handicapped on the time taken in the competition proper—e.g., Car A took 1 min. 30 sec. to negotiate the hill, and Car B 2 min. 30 sec., the latter had 1 min. start from Car A. Two prizes were given, the first being a silver cup by Mr. Ross Browne.

In the first round Mr. Ross Browne beat Mr. C. Hardy in the first heat. Heat 2.—Mr. Bolton beat Mr. A. King. Heat 3.—Mr. E. W. Lewis beat Mr. R. M. Wright. Heat 4.—Mr. J. C. Wilson beat Mr. P. Graham. Heat 5.—Dr. Tressider beat Miss Hooley. Heat 6.—Mr. Belcher beat Mr. Riley. Mr. Huskinson a bye.

In the second round Mr. Wilson beat Mr. Huskinson easily. Dr. Tressider beat Mr. Bolton by 50 yards. Mr. Ross Browne beat Mr. Lewis. Mr. Lewis was rapidly overhauling his opponent, and only suffered defeat by the length of the car. Mr. Belcher a bye.

The result of the ladies' driving competition was:—1st, Mrs. W. Shirley on a 6-h.p. De Dion; 2nd, Mrs. C. H. Bailey on a 28-36-h.p. Daimler.

Competitors in the "tilting at the ring" were handicapped by having the sun shining in their eyes. The result was:—1st, Mr. G. F. Mason, on his 10-12-h.p. Gladiator; 2nd, Mr. Francis Miles on a 16-20-h.p. Star; 3rd, Mr. W. Graham on his 28-36-h.p. Daimler.

The spectators got much amusement out of the glass of water race, in which the result was:—1st, Mr. R. Edwards's 18-22-h.p. Daimler (Mr. E. Thompson Willows driving); 2nd, Mr. G. F. Mason's 10-12-h.p. Gladiator; 3rd, Mr. R. W. Hunter's 10-12-h.p. Darracq.

The final motoring event was the ladies' passenger race. The result of this event was:—1st, Mr. E. Edwards's 18-22-h.p. Daimler (driver, Mr. E. Thompson Willows); 2nd, Mr. G. F. Mason's 10-12-h.p. Gladiator; 3rd, Mr. Rowland Sully's 15-h.p. Darracq. As, however, Mr. Mason had already won two prizes, the second prize was given to Mr. Sully.

The "Motor Union Medal" for the highest aggregate of marks was won by Mr. G. F. Mason.

The arrangements were principally in the hands of the hon. secretary (Mr. J. Thompson Willows), and other officials were:—Judges, Colonel Henry Lewis and Colonel A. James; starter, Captain Lionel Lindsay; timekeepers, Principal E. H. Griffiths and Mr. Evan Lewis; and marshal, Mr. T. Butt Ekias.

THE Naval Motor Club at Portsmouth, of which Lieut. A. G. Tracy is hon. secretary, has a membership of sixty-five.

At a garden party held by the Somerset A.C. at Woodborough House, near Bath, every event has been won by a Daimler car.

ON Saturday afternoon the members of the Dublin centre of the Motor Cycle Union of Ireland held their concluding hill climbing com-

The Commercial Vehicle Trials.—A halt for Luncheon.

In the third round Mr. Belcher beat Dr. Tressider easily. Mr. Wilson beat Mr. Ross Browne. The latter gave up in the final stretch, and allowed Mr. Wilson to pass the post an easy winner.

In the final Mr. Wilson beat Mr. Belcher. Half way up the larger of the two Humbers lost ground through the engine failing to respond at a critical moment, and the smaller Humber came in a comparatively easy winner.

The officials were:—Starter, Mr. G. H. Kirk; timekeepers, Mr. C. Perry and Mr. J. H. Sothorn; clerks of the course, Mr. C. Hardy and Dr. Hogarth; marshal, Mr. A. R. Atkey; handicappers, the Competitions Committee of the Royal A.C.; hon. secretary of the meeting, Mr. Booth Granger.

SOUTH WALES.

THE motoring and polo gymkhana which was organised jointly by the South Wales Automobile Club and the Cardiff and County Polo Club was held with great success at the polo ground, Whitechurch, on Saturday, when nineteen motor-cars were entered for the various events.

In the obstacle race the fastest time was made by Mr. E. Thompson Willows, driving Mr. E. Edwards's 18-22-h.p. Daimler. However, he displaced two of the hat-boxes, and Captain Hughes-Morgan, whose 40-h.p. Daimler did quick time, was also unfortunate in the same way. The quickest time by a car which kept within the course all the way was by Mr. Rowland Sully's 15-h.p. Darracq, with Mr. Sully at the steering-wheel. The result according to the handicap was thus:—1st, Mr. V. E. Brukewich's 15-h.p. Itala; 2nd, Mr. W. Graham's 28-36-h.p. Daimler; 3rd, Mr. G. F. Mason's 10-12-h.p. Gladiator.

petition of the season at the Sugarloaf Hill, in Co. Wicklow. In both classes the fastest time was made by Mr. Seaton Findlater on an 8-h.p. twin-cylinder J.A.P. machine, and his best time, 2 min. 33 4-5 sec., constituted a record for the hill.

THE 150-miles reliability trial for the Agnes Wood Trophy is being organised by the Junior A.C. for to-day (Saturday). The start and finish will be within twenty miles of London.

MR. C. R. GARRARD'S 15-h.p. Clement, which obtained the highest figure of merit, viz., 97-95 at the Caerphilly hill climb of the Cardiff M.C., was awarded the silver cup at that meeting—not the car of Mr. T. H. Woollen, as originally recorded. The Clement-Talbot cars which won Class 2, Class 3, and Class 4 on the formula at that meet also did the fastest time in those classes and secured record figures of merit, namely, 97-95, 84-41, 83-44.

THE MOTOR UNION.

THE Motor Union has decided to support and to make a grant towards the costs of the appeal by Sir Henry Norman, M.P., against a conviction by the Guildford bench of magistrates for driving to the common danger. Sir Henry was timed over a measured stretch of road near Godalming, and was summoned for the offence mentioned above, the alleged speed being thirty miles per hour. In evidence it was elicited (1) that the sergeant who worked the arrangement did not know into what fractions of a second his stop-watch dial was divided; and (2) that there was no vehicle or person of any kind whatever on the road. There is a clear view of the road, which is wide. The constable signalled by "unbuttoning his coat and showing his white waistcoat." The Bench imposed a fine of £3 without cost.

CASES UNDER THE MOTOR CAR ACT.

A DUTCHMAN'S NESCIENCE.

Morie Maas, described as a Dutch merchant, of the Castle Hotel, Richmond, was brought under a warrant before Mr. Francis, at Westminster Police Court, charged with driving a motor-car without a licence, and with failing to stop after a collision. Richard White, a cabdriver, said that on the 4th inst. the defendant was in collision with him at Knightsbridge, smashing three spokes, a wheel, and one lamp of the cab. The witness shouted to him to stop but he did not. Henry Woodhams, chauffeur to the defendant, said that the latter was driving at the time of the collision, for which the witness thought the cabman to blame. Mr. Maas was licensed to drive in Holland, and was not aware that he could not do so in England. Mr. Francis imposed a fine of £10 for driving without a licence, and £20 for not stopping. Two cabmen had been obliged to attend the court three times, and he allowed them 30s. each, which the defendant would also have to pay.

DANGEROUS DRIVING AND EXCEEDING THE SPEED LIMIT.

At the Horsham Petty Sessions, P. A. Rubens was summoned on Saturday for driving a motor-car to the danger of the public at Crawley on the 7th inst. Sergeant Bristow stated that on the Saturday afternoon in question he was timing motor-cars on the London road at 4.40 and timed the car in question, the speed over the measured quarter of a mile being at the rate of thirty miles an hour. Just before entering upon the quarter of a mile defendant passed a danger signal; he then came round a dangerous bend at the Sun Inn, and met a car coming in the opposite direction, a road joining the main road at right angles near the spot. Defendant, sworn, said he was going from Ascot to Turners Hill, and at an even pace of about fifteen or sixteen miles an hour. The Bench decided to convict for driving to the danger of the public. There was a further summons for exceeding the speed limit on the same occasion, and defendant was fined in each case £5 and costs.

At the Retford Borough Police Court, last week, Edward Speranza, of Teddington, was charged with exceeding the twenty miles per hour speed limit at Retford on the 1st inst. Evidence was given by Inspector Meakin, who estimated the speed at which defendant drove his car from the Great Northern Railway bridge to the Whinney Lane corner, on the Great North Road, at from thirty to thirty-five miles per hour. In cross-examination witness admitted that he did not use a stop-watch, and could only estimate the speed by his observation of the car for a distance of 300 yards. A fine of £5 was inflicted. A fine of the same amount was inflicted on a chauffeur from Eltham who exceeded the ten miles speed limit in the town.

Amongst a batch of motorists summoned at the Hove County Bench recently for driving at excessive speed on the Brighton road, at Pyecombe, was Mr. P. W. Paddon, of Albemarle Street, London, who was said to be travelling at the rate of thirty-seven miles per hour. Defendant pleaded guilty, but urged in mitigation of the fine "that the car was on Saturday last involved in a terrible tragedy in which his partner had been killed." The magistrates, remarking that they could not listen to sentiment, imposed a fine of £5 and costs. The partner alluded to was Mr. Vincent Hermon, who was fatally injured at Brooklands.

At the Spittlegate (Grantham) Petty Sessions, on Saturday, four cases against motorists were heard. Mr. G. G. Fellows, who was summoned for driving at a dangerous rate, was described by the police as a "thorough gentleman," he thought the constable the "nicest policeman he had ever met," and was only fined 20s. and costs. Another motorist who did not agree with the police estimate of speed was fined £2.

THE PRODUCTION OF THE LICENCE.

Lieut. Keating, of the Grenadier Guards, Wellington Barracks, London, has been summoned for failing to produce his licence for endorsement within a reasonable time after conviction at the Kingston Court, and a letter having been read by the chairman from defendant's solicitor regretting the oversight and explaining that the defendant was away on manoeuvres, the summons was dismissed on payment of costs.

HEAVY HAULS.

At Lancaster, on Saturday, three motorists were fined £15 and costs for exceeding the legal limit, and at the Carlisle Court the fines and costs in four cases against motorists aggregated £26. Five motorists have been fined at the Midhurst Petty Sessions, four at Surbiton, and seven at Kingston—all on one day.

In a Sussex Court, on Monday, eight motorists were fined sums ranging from £2 to £10 for exceeding the legal limit.

On Monday, at the Haywards Heath Petty Sessions, seven motorists were proceeded against by P. S. Waghorn and fined various sums, aggregating £29 and costs. On the same day fourteen summonses were heard by the Arundel county and borough magistrates, and fines of £8 imposed, with costs.

THE Continental Tyre Company, owing to the great demand for their goods in Birmingham and district, are opening a depot in that city. Suitable premises have been acquired at 256, Corporation Street, and in two or three days the branch will be opened under the management of Mr. E. P. Coulter. A large and varied stock will be held, and customers will no doubt appreciate the fact that delivery will be obtainable much quicker than when ordering from London.

RACING AT BROOKLANDS.

ANOTHER race meeting has been arranged by the Brooklands A.R.C. for the 12th prox., entries for which close on the 3rd prox. The events to be run are as follows:—

THE SECOND 26-H.P. RACE OF 150 SOVS.—For cars propelled by means of internal combustion engines only, of a cylinder dimension of 64 or under. Weight 2,000 lbs. Distance about 2½ miles.

THE SECOND 40-H.P. RACE OF 150 SOVS.—For cars propelled by means of internal combustion engines only, of a cylinder dimension of 100 or under. Weight 2,500 lbs. Distance about 2½ miles.

THE SECOND 60-H.P. RACE OF 150 SOVS.—For cars propelled by means of internal combustion engines only, of a cylinder dimension of 150 or under. Weight 2,700 lbs. Distance about 3½ miles.

THE SECOND 90-H.P. RACE OF 150 SOVS.—For motor-cars propelled by means of internal combustion engines only, of a cylinder dimension of 225 or under. Weight 3,000 lbs. Distance about 2½ miles.

THE MEDIUM HANDICAP SWEEPSTAKES OF 10 SOVS. FOR ACCEPTORS.—For motor-cars propelled by means of internal combustion engines only, of a cylinder dimension of 104 to under 122. Weight 1,700 lbs. Distance about 5 miles. Entrance: 10 sovs., of which 5 sovs. will be returned to those declaring forfeit within 48 hours after publication of the handicap.

THE OCTOBER HANDICAP SWEEPSTAKES OF 10 SOVS. FOR ACCEPTORS.—For motor-cars propelled by means of internal combustion engines only, of a cylinder dimension of 150 or over. Weight 2,900 lbs. Distance about 5½ miles.

The entrance fee for the first four events is 7½ sovs. p.p., and the entrants of the winners will receive 100 sovs.; the entrants of the second, 40 sovs., and the entrants of the third, 10 sovs. The entrance for the handicaps is 10 sovs.

The executive of the Brooklands Automobile Racing Club make a point of measuring the cylinders of various cars entered for races at the conclusion of every meeting, in order to verify the dimensions given by entrants on their entry forms. The selection of such cars is entirely haphazard, and at the conclusion of the race meeting on the 14th inst. (reported in our last issue), the following cars were officially measured:—

In the first 26-h.p. race, Mr. O. Copper's 25.6 Metallurgique, bore 3.997 in.; Mr. E. A. Rosenheim's 25.6 Arrol-Johnston, bore 3.999 in.

In the first 40-h.p. race, Lt.-Col. C. D. Carleton-Smith's 38.4 Napier, bore 4 in. (six cylinders); Mr. A. Huntley-Walker's 35.7 Darracq, bore 4.727 in.

In the first 90-h.p. race, Mr. E. G. Drabble's 75.9 Mercedes, bore 6.87 in.

AUTOMOBILE INSTRUCTION.

BELOW we give some information with regard to technical instruction in automobile matters at the leading institutes in the country:—

The Municipal School of Technology at Manchester, of which Mr. J. H. Reynolds is the Principal, has not, as yet, arranged for any classes in motor-car engineering, but has included a course of road carriage and motor-car body building in its programme for the coming season.

At Leeds, the Higher Education Department is organising a course of lectures on motor-car engineering at the technical school by Mr. J. C. Bennett Mitchell. The course will follow the syllabus of motor-car engineering issued by the City and Guilds of London Institute.

An extended prospectus of the day and evening classes in motor-car engineering at the City of Bradford Technical College has been issued by Professor G. F. Charnock, the head of the department.

The Northampton Polytechnic Institute, St. John Street, Clerkenwell, E.C., was among the first of the London educational institutes to include the motor-car in its syllabus, and automobiles are again in the curriculum for the coming season. Lectures, laboratory work and drawing and design will be included in the course of instruction under Mr. C. E. Larard, assisted by Mr. D. G. Snodgrass.

Classes for instruction in petrol motors will be held at the Borough Polytechnic Institute, 103, Borough Road, S.E. Mr. A. Marsden is the instructor, assisted by Mr. W. Hill. This course is intended as a complete course for motor repairers, drivers, and amateurs driving their own cars.

Day and evening courses of instruction for motor-car engineers, mechanics, drivers and others are being held at the Polytechnic, 307-311, Regent Street, London, W., under the direction of Mr. H. J. Spooner. The equipment of the workshops includes a 10-h.p. two-cylinder Daimler motor. Messrs. J. S. Mathias and J. Johnson are the instructors in driving.

The Polytechnic Road Carriage and Motor Body Building Schools are in Balferton Street, Oxford Street, W., under the direction of Mr. Ernest Bailey. A special course of evening instruction is being given in road carriage building and motor body building.

Monday morning the classes in motor-car engineering at Battersea Polytechnic, Battersea Park Road, London, S.W., will commence as well as the lessons in driving, which have been a feature of the instruction offered at this institution hitherto.

THE MOTOR CYCLISTS' CONFERENCE.

At the Guildhall at Lincoln, on Saturday, the 21st inst., a conference of motor-cyclists was held, when there was a large attendance of motor-cyclists from all parts of the country. Mr. R. Todd (chairman of the Auto-cycle Club) presided. The Deputy Mayor of the city (Councillor A. C. Newsum) welcomed the delegates to the city. The City Sheriff (Dr. E. Mansel Symson) explained the Corporation regalia, and at the close of this a vote of thanks was accorded to the Deputy Mayor and the Sheriff for their welcome to the city, on the proposition of Mr. R. Todd (the chairman), seconded by Mr. A. W. Foster (chairman of the Lincolnshire Motor-cycle Club).

The first business on the agenda was a resolution from the Newcastle and District Motor Cycle Club, to the effect "that the time has now arrived when the Auto-Cycle Club should reconsider its position with respect to the support of motor-cycling; considering the altered circumstances, so as to further encourage the affiliation of provincial clubs, and enhance the sport of motor-cycling." There were several other resolutions on the agenda, and a lengthy discussion took place on the matter, several speakers expressing the feeling that the Auto-Cycle Club had neglected the interests of the motor-cyclists in favour of car owners. The combination of the Auto-Cycle Club and the Motor Union was described as unnecessary, and the opinion was expressed that one organisation should suffice for motor-cyclists. Ultimately the following resolution, proposed by Mr. G. J. Wilkinson and seconded by Mr. Bates (Newcastle) was carried:—"That the Auto-Cycle Club be reconstructed, and form an Auto-Cycle Union, composed of affiliated clubs, which shall control all local matters, the clubs being represented on the Auto-Cycle Union Council on the basis of one for each twenty-five members, or proportion thereof, the council to control the sport and safeguard the interests of motor-cyclists."

The Conference further agreed to the election of a committee of nine to meet and confer with the Council of the Auto-Cycle Club on matters of detail. In the afternoon a meeting of the Council of the Auto-Cycle Club was held, also in the Guildhall. There was a long discussion, and in reply to questions Mr. Rees Jeffreys defended the action of the Motor Union, quoting figures regarding the benefits received by motor-cyclists in response for the money paid by them. He gave statistics to show that only £150 was received by the Union from motor-cyclists, whereas quite £300 was spent on their behalf. Eventually the following proposition of Mr. G. J. Wilkinson, seconded by Mr. McCardie, was agreed to *nem. con.*:—"That the resolution of Mr. Wilkinson from the Conference held this morning be approved in principle, and that it be referred to the General Committee to meet the Committee appointed at the Conference, and discuss the best means of carrying such resolution into effect, and to report to a special meeting of the Council as soon as practicable."

A dinner in connection with the conference and council meeting was held in the evening at the Hotel Central, when Mr. A. W. Foster (chairman of the Lincolnshire M.C.C.) presided, and the vice-chair was occupied by Dr. Godfrey Lowe (vice-chairman of the Lincolnshire M.C.C.) After the loyal toasts, Dr. Lowe proposed the toast of "Our Motor Organisations."

Mr. R. Todd (Chairman of the A.C.C.) responded on behalf of the Royal A.C., and said that the A.C.C. and the Motor Union had got on smoothly and comfortably together. In some respects the interests of car owners and motor-cyclists were separate, but in nine cases out of ten they were practically the same.

Mr. Rees Jeffreys also responded and asserted that the work in which the Motor Union was engaged was of an enduring nature, and one which those who followed would approve and ratify. The work was one which was benefiting the motoring movement. He was perfectly convinced the future had nothing but happiness and prosperity for the Motor Union so long as it continued on its present lines, with one single aim—to improve and advance all motor industries of the country. Mr. F. Straight (secretary of the A.C.C.) offered a third response to the toast, and thought the result of the meetings that day would be beneficial to motor-cyclists generally.

Mr. R. Todd submitted the toast of "The Lincolnshire Motor Cycle Club." The response came from Mr. A. W. Foster, who paid a tribute to the energy of the secretary. It was a year the previous day since they became an established club, and he thought they could pat themselves on the back a little for having brought a club together of 250 members. Mr. G. J. Wilkinson (the secretary) also responded, and said they were very much honoured by the esteem in which the Lincolnshire Motor Cycle Club was held throughout the country.

The next toast was that of "The Visiting Clubs," and this was proposed by Mr. Wilkinson, who remarked that that day they set out on a new era, and saw their cause much strengthened.—Replying, Mr. J. H. Hall, of Sheffield, said they were all feeling delighted with themselves that they had gone that day a good many steps further up the ladder. The Press were toasted at the initiation of Mr. C. A. Smith. Dr. Godfrey Lowe gave "Our Visitors," and Mr. J. Van Hooydonk replied.

A NEW preparation known as Motoflor, for giving a pleasant odour to the exhaust of petrol cars, is being put on the market by Messrs. Regidor and Doumin, of 40, Trinity Square, London, E.C. It is added to the petrol in the proportion of 2 oz. to 5 gallons, and is claimed to in no way alter the nature of the spirit.

GYMKHANA AT ROSS.

LAST week we briefly mentioned the motor-car gymkhana held on the ground of the Ross Golf Club, and which was a great success. It should result in a substantial reward to the Golf Club, which undertook the organisation. There were 133 entries, and Mr. T. H. Coombes, the secretary, is to be congratulated on the way in which the event was organised. The first in each contest were as follows:—Ladies' Passenger Race, Mr. S. Pardoe (15-h.p. Panhard); the Academy Stakes, Mr. C. L. Llewellyn, jun. (10-12-h.p. Humber); Tilting at the Ring, Miss M. A. Webb (10-12-h.p. Humber); Lofting and Putting Race, Mr. C. L. Llewellyn, jun. (10-12-h.p. Humber); Tortoise or Slow Race, for mechanics, J. Campbell (12-16-h.p. Albion); Blindfold Race, Mrs. Dudley Beaumont (12-h.p. Gladiator); Musical Chairs, Dr. Cutfield (12-h.p. Siddeley).

OBSTRUCTING MOTORISTS.

At Highgate Police Court, Theodore Lehmann, of Queen's Avenue, Muswell Hill, and John Ardite, of Porchester Gardens, Bayswater, were charged with failing to keep on the left or near side of the road at Whetstone, thereby obstructing the traffic. P.C. Overall, 56 SR, stated that the defendants obstructed a motor-car for over fifty yards. Mr. Lehmann asked that he might be allowed to take the whole responsibility, as his friend, a Frenchman, could not ride very well, and entrusted himself solely to his guidance. He knew that he had committed an offence, and when the gentleman in the car stopped and told him so, he apologised, and the gentleman accepted the apology. Mr. Merton Jones, solicitor, said he was the motorist. It was quite true that Mr. Lehmann apologised. Sir Alfred Reynolds: The police constantly receive complaints from motorists and others of obstruction on the Great North Road, and it is their duty to take action. However, in this case

The Uno 10-12 h.p. Van No. 6, Class A, which is taking part in the Commercial Vehicle Trials.

defendants have erred unwittingly, and justice will be met by the payment of costs in each case.

ROAD REPORTS.

EXETER.—As far as is possible Mr. T. Moulding, the city engineer and surveyor of Exeter, endeavours to keep the roads over which he has jurisdiction useable by motor-cars when they are under repair. Local motorists appreciate this regard for the convenience of users of the road.

WORCESTER.—The county steam-roller has been at work on the Worcester and Alcester road and repairing will be in progress for some time.

ALVECHURCH.—It is noticed that the main Birmingham road through Alvechurch is crumbling, and that the surfaces of the bye-roads are also in a very loose condition.

SPEED LIMIT APPLICATIONS.—In several places the local authorities are urging County Councils to apply for the limitation of the speed of motor-cars to ten miles an hour, notably Slough, Guisborough, and Kingswood.

PETWORTH.—The Petworth Parish Council have had erected at the entrances to the town boards with notices urging motorists to drive their cars slowly.

SEAFOORD.—The Lewes-Seafoord road is inadequate to modern traffic both as regards width and surface, while its extraordinary contortions are the gibe of the travelling public. The number of motoring visitors to Seafoord has grown during the past few years to a remarkable extent while people taking their automobiles to the Continent over the Newhaven-Dieppe route are ever on the increase. The Newhaven Rural District Council have just expressed the opinion that the road should be improved, and suggested that the County Council should make extra grants for the purpose.

FORTHCOMING EVENTS.

SEPTEMBER.

- 28th (S.).—Ipswich and East Suffolk A.C. petrol consumption trial.
Midland A.C. at Tudor Grange, Solihull.
Birmingham M.C.C. run to Feckenham.
- 29th (Su.).—Run of the Southend and District M.C. to Bishop's Stortford.
Cardiff M.C. run to Cowbridge.
East Surrey A.C. run to Midhurst.
Lincolnshire A.C. meet at Grimsby.
Western District M.C. run to Ewell.
- 31st (M.).—Chatham M.C. run to Port Victoria.
Commercial Vehicle Exhibition at Leeds.

OCTOBER.

- 3rd (Th.).—Brooklands A.R.C. entries close.
Speed judging competition of the West Essex A.C.
- 12th (S.).—Close of the Commercial Vehicle Trials. Final run from Baldock to Dalston, London, N.
Southend M.C. closing run of the season to Witham.
Brooklands A.R.C. meeting.
- 17th (Th.).—Demonstration of Commercial Motor Vehicles in Glasgow, under the direction of the Commercial Vehicles and Industrial Committee of the Scottish A.C.
- 19th (S.).—Auto-Cycle Club's quarterly trial.

NOVEMBER.

- 13th (W.).—Annual Dinner of the Motor Union.

MARCH, 1908.

- 21st-29th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

LIGHTING-UP TIMES—LONDON.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

DIVISIBLE RIM AND MOTOR TYRE SYNDICATE.—£2,000. To acquire a patent belonging to Mr. T. Dunn, and to carry on business indicated by title. No initial public issue. Registered without articles.

INTERNATIONAL MOTOR TRAFFIC SYNDICATE.—£100. 14-15, Bedford Chambers, Covent Garden, W.C.

SELBACH INDUSTRIAL MOTORS.—£10,000. First directors: Messrs. O. C. Selbach (managing director), G. M. Gibson, N. M. Lawrance, L. P. Piellat, and S. B. Saunders. Bush Lane House, E.C.

LANGDON-DAVIES MOTORS (CANADA).—£1,000. First directors: Messrs. F. B. O. Hawes and A. E. Alston. The Langdon-Davies Motor Company, Limited, have consented to this registration.

EMPRESS MOTOR COMPANY.—£10,000. To take over the business carried on by Messrs. A. M. Tejeria, F. Smith, and C. A. Fletcher at 180A, Stockport Road, Manchester, as the Empress Motor Company. 180A, Stockport Road, Manchester.

WILLIAM LEE, BELFAST, LTD.—Capital £5,000. To carry on business of motor-car manufacturers and dealers. Directors not less than two nor more than five, the first being Messrs. William Lee, Moseley Hill, Liverpool; E. J. Hartenfeld, York Street, Belfast; Samuel Patton, Larne; and Herbert N. Harte, Liverpool. Registered office, 19-21, York Street, Belfast.

AUTOMOBILE ACCIDENTS.

A SINGULAR motoring accident has taken place on Standedge, the high moorland midway between Manchester and Huddersfield. Mrs. Waring, of Southport, left Huddersfield in the morning with two lady friends to return to Southport in a 40-h.p. car. Going down the brow at Ragstones, Denshaw, the wheels began to skid, and a jerk came so violently that Mrs. Waring and her niece were thrown over the high back of the car on to the road. The third lady is reported to have been so horrified that she could not speak, and the driver had gone nearly half-a-mile before he knew that Mrs. Waring and her niece were not in the car. He turned back and found them on the road. They were placed in the car and taken to the house of a doctor at Delph. Mrs. Waring sustained severe cuts and concussion of the brain. The girl is suffering from shock and injury to the head.

At the West Ham Coroner's Court, on Monday, Mr. W. J. Attwater held an inquest on Robert Canham, aged sixty-one, who was knocked down by a motor-cyclist on Friday of last week. William Hardcastle, who was riding the machine, and was badly injured, was arrested on a charge of manslaughter. The evidence showed that the deceased man, whose sight was rather defective, was crossing High Street, Stratford, when Hardcastle approached, riding the cycle at a moderate speed. Canham hesitated, and then, according to one of the witnesses, "walked right into the cyclist." He was knocked down, and Hardcastle was thrown across the road, and sustained severe injuries to the face. The coroner said he would adjourn the inquest in order that a post-mortem examination might be made.

CRIPPLED PEOPLE'S OUTING.

BETWEEN fifty and sixty poor children and a number of aged cripples living in Carlisle enjoyed a pleasant motor tour organised by Mr. J. H. B. Johnston, on Saturday afternoon. They assembled at the Crescent and through the kindness of a number of local motorists were taken by car to Bowness-on-Solway, by way of Kirkhampton and Cardurnoch. At Bowness, a substantial tea was provided. Carlisle was reached in the evening without mishap of any kind. Those who sent cars were Messrs. Claude Lowther, Theodore Carr, R. Dais, J. Fendley, G. C. Glenny, T. Graham, P. Hayton, J. Holliday, J. Hodgson, W. Hetherington, H. F. Leavers, H. A. P. Mawson, and J. Palmer.

MOTORIST v. TRAMCAR.

JOHN WYATT, a chauffeur, was, at Kingston-on-Thames, fined £2 17s. 6d., including costs, for obstructing a tramcar at Kingston Road, New Malden, on August 8th. According to the evidence the defendant was in charge of two motor vehicles—one car towing a disabled car—along the tram track, hindering the cars for 12½ minutes, several trams being held up. The defendant, it was alleged, was stuffing a punctured tyre with grass gathered from the roadside, and, although the passengers of the electric car dismounted and offered to assist in towing the disabled car off the track to a side road, a man with defendant calmly took out his pipe and commenced to smoke, saying they would not move.

PUBLIC MOTOR SERVICES.

THE Scottish Motor Traction Company will, during the winter, continue their motor-bus services between Edinburgh, Uphall, Loanhead, Penicuik, Gorebridge, Bonnyrigg and Dalkeith.

BANFF.—A suggestion that the Banff District Committee should regard the motor-omnibus service between that town and Strichen as of the nature of ordinary road traffic has not been acceded to by that body. The chairman reminded the meeting that as road trustees they must administer the Act as it stands.

THE Great Eastern Railway Company forward particulars of their motor services which commence on the 1st prox. and will continue most probably to the end of the year. These include motor-omnibuses for the conveyance of passengers, light goods and parcels between Norwich and Loddon, Ipswich and Shotley, Chelmsford and Writtle, Colchester and West Mersea, Lowestoft and Southwold. Time tables have been issued in connection with these services on similar lines to those used in connection with the ordinary train services.

It will not be long now before the British Motor Cab Company, Ltd., with its British built motor-cabs, is upon the streets. The cabs will be shod with British tyres, namely, the "Garantire," while it is interesting to note that "Automobilia," of Marble Arch, W., have secured the first contracts for uniforms and waterproofs.

POLICE TRAPS.

THERE is a motor trap being worked between Truro and Redruth. Touring parties to the Land's End should be on the look-out.

POLICE watchfulness is keen on the Perth and Cupar-Angus road. ON the Brighton road, to the south of Crawley, the police have a measured distance.

THE Otley Road (Headingley) police trap has had several victims during the past few days.

AROUND Petersfield several traps are in daily operation.

IN the village of Walshford Bridge (Knaresborough) is a measured quater of a mile watched by three constables, two of whom are provided with stop watches.

A NEW trap has been set up at Yealand Redmayne, on the Milnthorpe (Kendal) road, from telegraph pole 342 to an ash tree between poles 334 and 335, with a cross road, Moss Lane, from Yealand to Burton.

THE Kingstown trap, on the main road from Carlisle to Scotland, is in active operation.

AT Walshford Bridge, on the Boroughbridge road, is a trap leading to the Knaresborough Petty Sessions.

MOTORISTS travelling on the main road between Wellington and Shrewsbury should beware. There are several police pitfalls on the way.

THE Slaughtam cross-roads is again provided with a police trap.

ABOUT fifty yards from the gate where the footpath leads from the Canterbury road to the Swingfield and Lydden road, near Dover, a trap is frequently in operation.

IN the parish of Poston, on the Great North Road, between Newark and Grantham, is a trap.

A SET of Dunlop tyres and spares has been ordered for the car personally used by the Emperor of Japan.

THE Belhaven Engineering and Motors, Ltd., of Wishaw, N.B., are shortly opening a new garage and repair shop at 265, Hope Street, Glasgow.

WE have received from the Continental Tyre and Rubber Company Ltd., a souvenir of D. Resta snatching victory from J. E. Hutton, for the Prix de la France, at Brooklands, last Bank-holiday. The sketch depicts in a most spirited manner D. Resta's powerful Mercedes car racing at 90 miles an hour on Continental tyres.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, OCTOBER 5, 1907.

[No. 448.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

ELSEWHERE we have something to say with regard to the clothing of motorists in the cool days of autumn and the colder days of winter. This sketch will be continued in our next issue, and will present motorists with an idea of the leading styles available for their comfort this season. Generally we have considered the car and given greatest prominence to its

parts and features; but the reference to the clothing of the man at the wheel, and passengers also, will serve a useful purpose, and next week's contribution on the subject will be of even greater interest than the present.

London Traffic.

ON Thursday, the 3rd inst., Mr. W. N. Twelvetrees gave his presidential address before the Civil and Mechanical Engineers' Society, on the question of London street traffic regulation. This is a subject that has been much discussed since motor-cars began to quicken the congested traffic of our City streets, and we agree with Mr. Twelvetrees that one of the greatest hindrances to vehicular traffic is due to the compulsory stoppages necessary for permitting passes of vehicles along intersecting routes; although mention might also be made of the too long halts allowed to stationary vehicles by the cab stands. In that part of Cannon Street near St. Paul's is an object lesson every morning, which is only possible in the City, and if the vehicles were not permitted to line the roadway up to a late hour in the morning, much of the congestion between the City and the West End would be avoided. The same thing is true in other districts. Mr. Twelvetrees also revived the idea of gyratory traffic regulation, which was first proposed for London by Mr. Holroyd Smith, about a decade ago. Unfortunately, we seem to make little progress to a practical realisation of these schemes. Papers have been read and discussed for years past, but the traffic seems to become thicker than ever.

A Million for Roads.

ALTHOUGH perhaps of wider extent than a scheme for London only is the suggestion put forward this year by the Roads Improvement Association. This is an ambitious project—probably flying high in order to realise but a moiety of its desires. The Association asks for a modest million pounds sterling from the Exchequer to be distributed among the various road authorities for the purpose of (1) widening main roads;

(2) removing dangerous corners; (3) cutting new roads; (4) putting in foundations to weak roads; (5) encouraging the use of better road materials; (6) making existing roads dustless. It is urged in support of the idea that the changes proposed by the Chancellor of the Exchequer in local taxation accounts pave the way whereby the State should contribute more liberally and equitably towards the cost of the construction, improvement and maintenance of roads. It is also proposed that the taxes of all classes of road vehicles should be reconsidered and revised and paid into the Imperial Exchequer to form a nucleus of the proposed fund, it being the declared policy of motorists that they do not object to paying extra taxes providing they are reasonable and the funds so raised are devoted to the improvement of roads under a central department.

A Niggardly Council.

AT Penzance the surveyor to the West Penwith Rural Council has reported that there were in his district thirty dangerous hills and corners where motor signs were really necessary. To place these in position would require about £56 as a maximum expenditure. Unfortunately for the safety of the lives of motorists and others using the roads, the economists in the illustrious Council of West Penwith were in the majority, and accepted a proposal that only £20 should be spent on warnings this year, as a tentative measure. The Council, having thus reduced the estimate of the surveyor, proceeded to select three of his thirty dangerous places for early attention. Such an instance of the fussiness of local authorities is, perhaps, somewhat exceptional, but it illustrates the difficulty of surveyors and other officials in efficiently carrying out their duties.

Hand v. Machine in Tarring the Roads.

ON Saturday, the Public Health and Local Government Officers' Association for Sussex paid a visit to East Grinstead, when Mr. Woodlam read a few notes on highway and sanitary administration in East Grinstead. The chief interest, however, centred in his views and methods in the upkeep of the roads and the tackling of the dust nuisance. The dust nuisance had, he declared, been solved there—at any rate temporarily, by the application of tar to the surface. During the past three years they had been tarring their roads in increasing quantity, and this year a continuous length of three miles had given unqualified satisfaction. Mr. Woodlam mentioned that through the public spirit of his Council he had been able to attend tar experiments in several places, and he had formed the opinion that no tar spreading machine was at present able to turn out the work as it could be done by hand. He, however, did not wish to

disparage the machines; in fact, he advocated affording the makers every possible encouragement, and he quite anticipated that, at no distant date, an efficient machine would be met with. A well-constructed tar-paved road was as near dustlessness as they could get, while tar had splendid preservative properties. Motor cars did not cause the slightest injury to roads so treated and they were much better for traffic, both reducing vibration to a minimum and reducing noise. The greatest drawback to tar macadam was the initial cost.

Automobiles as Road Rollers.

At the meeting of the Gwyrfai Rural District Council at Carnarvon a discussion has taken place respecting the damage done to the roads by heavy motor-wagon traffic, and it is satisfactory to find that the surveyor to that body recognises that motor-wagons are equally entitled to the use of the roads with ordinary vehicles. Personally, he said, he was inclined to think that motor-wagons did more good than harm to the highways, for during a certain portion of the year they acted as steam-rollers. This view is not often officially represented to the local authorities, but it is one that should not be overlooked by advocates of motor vehicles, and we should be pleased to hear from any of our readers in districts where local surveyors take a similarly reasonable view of the matter.

The Manchester Motor Club's Hill Climb.—Mr. Henry Hollingdrake at the wheel of his 35-50-h.p. De La Buire Car, the winner of the over £550 section.

Police Methods.

At the Kingston Police Court, Superintendent Marks, whose name has a familiar sound about it, has mentioned that his officers are now abandoning the timing of cars by stop watches in many places owing to the activity of the scouts warning motorists as to the presence of traps and pitfalls by the way. The police, therefore, are relying upon "estimating" the speed at which cars are travelling, and in several cases before the court the policeman gave the speed, adding the words "in my opinion." This adds another terror to the motorist, for, while the police trap was often unfair in its operation, it is absolutely impossible for policemen to gauge the speed of cars travelling upon the road with any degree of accuracy. Fortunately the police in all parts of the south are not so vindictive as those of the Kingston district have shown themselves to be, and the instance of reasonableness given by our correspondent "Rover" on another page is a welcome exception to the general rule. We

congratulate the motorists of Brighton, as we recently did those of Ipswich, on the possession of a chief constable who introduces common sense into his methods of administration.

Irish Roads.

THAT there is need for the work of the Irish Roads Improvement Association is acknowledged by everyone who has ever travelled over the highways of the Emerald Isle. At the same time, all must recognise the assiduity with which the Association is promoting public opinion favourable to local authorities devoting money as well as attention to the improvement of the roads of the country. Considerable work has been done in acquainting surveyors of stretches of roadway which were in a deplorable state, and these have in many cases been improved in consequence. We understand that an appeal will shortly be made to Irish owners of motor-cars urging them to take greater interest in the work of the Association, which is certainly one of the most promising factors in the outlook for better ways in Ireland.

A National Question.

SUCH a view is interesting, as coming from the other side of the Irish Sea, for it is practically a reflex of the view that is growing in this country, viz., that the road question will have to be treated as a national matter, and, instead of the local and parochial tinkering with short stretches that has hitherto been the rule, whole mileages across counties will have to be under the supervision of specially-appointed men or authorities with power to look at the subject from a wider view. Such a proposal is now an accepted plank in the motoring platform, and is one of the points upon which practically all are agreed.

A Rector's Charitable (?) View.

THE Rev. E. M. Gibson, vicar of Charlwood, who is chairman of the Reigate Rural District Council, has on several occasions condemned motoring. At the last meeting of this authority a communication was received from the Kingswood Parish Council stating that a serious motor accident had occurred at the corner of the main road leading to Mogador, owing to some trees inside a fence having grown to such a height as to block the view of the road. The Parish Council asked that some steps should be taken to prevent further accidents occurring. It was suggested that if the finger-post was moved to the north side of the road it would meet the case. To this a councillor disagreed, and said if a small committee was appointed and met some of the gentlemen owning land, and who were motorists, they might give a small strip of land, and so widen the road at the corner. The Rev. E. M. Gibson opposed the suggestion, saying if people would go motoring round dangerous corners at a fast pace they would have to take the risk. He thought the finger-post should be removed, but nothing else done. Mr. C. H. Harrold opposed any alteration which would give further facilities for motoring at a high speed, and, better than the reverend gentleman, added he only hoped all the motorists would kill themselves. He was against spending a penny of the ratepayers' money in facilitating the motor traffic. The roads were all right, and therefore he thought nothing should be done.

"Killing no Murder."

FORTUNATELY this view is not the universal opinion of chairmen of rural district councils, nor is it expressed by many clergymen. Really, we should have thought that the maiming of limb or the destruction of life would have been abhorrent to these gentlemen, who seem to believe, with those of earlier centuries, in "killing no murder"—provided, of course, that the person slain is a motorist. We condemn, with no uncertain voice, the conduct of those who rush through narrow lanes scattering poultry and people and devastating the

country side, and would view their progress to the police court—even that at Haywards Heath—with a feeling that both justice and motorists would be done. But surely the horseless and the motorless users of the roadway have the right to live. And if the safety of all sections is likely to be increased by lowering hedges, rounding corners, and setting up warning boards, it ill becomes an advocate of peace and goodwill to hope—as did Mr. C. H. Harrold at that meeting—that “motorists would kill themselves.” They are not likely to do that; but we trust Mr. Harrold will keep on the grass of the sidewalk.

Associated Touring.

ONE or two interesting developments in connection with the touring of private owners of motor-cars have lately been brought to our notice, and seem to suggest the possibility of economy and pleasure combined. A motorist of only moderate means has had a good time recently by letting his car on hire, with himself as a kind of gentleman-driver, for a month's tour in the Lake district and the Highlands of Scotland. Others have arranged with gentlemen wishing to see the Continent that they should accompany them on their cars, the sharing of ex-

the existing thoroughfares into districts which have recently been opened up. What is wanted is that the Government should take over the main roads from the local bodies and supervise their control. It seems strange that a local shire, naturally very parochial in its acts and intentions, should have charge of a national highway. The municipalities have had from the Government vast sums of money for works of a national character—main roads and bridges, &c.—but it has been shown that the money has been used as often for local improvements, which saved them direct taxation.

Disgusted.

WILLIAM PORTER, of Birmingham, was summoned at the Sparkhill Police Court for driving a motor tri-car at Greet without having the rear identification plate illuminated. Defendant said the car had been in an accident, and the lamp was broken. He was merely fetching it for a gentleman. He had been in trouble twice, and had decided to give up motor driving. He had come to the conclusion that it was better to work in a factory than drive outside. He would be more safe. Asked to produce his driving licence, the defendant said he had

[La Suisse Sportive.

penses materially assisting the motorist to an extended holiday. The outdoor pleasure of motoring lends itself to this sort of thing, and with a little enterprise several motorists have been able to add to their pleasures during the recent season. This is even better than the suggestion of our correspondent last week, that motorists should invite the public to occupy vacant seats on their cars.

The Outlook in Australia.

TOURING by the motor-car is not indulged in to the extent it should be, writes our correspondent at Melbourne, because of the general bad state of the roads. Once off the main highways the going is very patchy, and if the cars happen to be caught in the rain there is trouble. Unfortunately for the State, the condition of the roads has been deteriorating for the past twenty or twenty-five years, owing to the faulty methods of the local bodies—municipalities—adopted for their repair. Anything above twenty-five miles an hour on the most of them is ruinous to the springs and, sometimes, to the under-carriage, if the latter has not sufficient clearance—say nine inches at least. The Government promises to introduce a Main Roads Bill into the House during the present session, but, from what can be gathered, it will, probably, be for the extension of

torn it up. He was determined not to do any more motor driving for anybody. His licence had been endorsed for fast driving, and on the present occasion he was fined 20s. There is a good deal of sound philosophy in the decision, and we would sympathise with Mr. Porter. The system of endorsing licences for merely technical or minor offences is discouraging to men and should be revised.

In Skye.

NOT by airship, but by car and steamer. Elsewhere we give some comments of a motorist who has been to the Isle of Skye. He noticed that all the horses in the island gave trouble at sight of a motorist, and that stray cattle and sheep abounded on the roads, to say nothing of herds of deer. Dogs, too, were an unmitigated nuisance, and unusual care was necessary in driving through villages. A good plan with regard to petrol is for intending visitors to communicate with Mr. J. C. Mackay at Portree and arrange with him for supplies, or to secure the help of the manager of the Sligachan Inn in the matter. Roads vary with the weather in the Isle of Skye to a greater extent than in most other places, but fortunately the experience is that they dry quickly after the heavy rains.

MOTORING AROUND LYNMOUTH.

SOONER or later in the course of their experience all motorist get, or should do, to Devon. And then the way is naturally made to Lynton and Lynmouth—two lovely spots, which every lover of fine scenery should see. In fact, the north coast of Devon is a delight to all who appreciate natural beauty, especially when—as in the case of the motorists shown in the accompanying illustration—a 30-h.p. White steam car is the vehicle on which the journey is made. The car is seen coming up the famous Lynmouth Hill, the town lying just out of sight down on the sea level behind the cliff, over which the road leads, as shown in the photograph. The illustration gives a very good idea of the long climb it is necessary to negotiate in taking the main road to the eastward out of Lynmouth.

During the summer the question of motoring has been well to the fore in the district. At one time the proposal was made

bury. That successfully overcome, the road is considerably easier thence to Porlock, ten miles distant from Countisbury. The way should be very carefully taken, for the descent to Porlock is a stiff drop with nasty twists that have to be watched for all the way down. Once again on fairly level ground there is a good road to Minehead, which is about as far from Lynmouth as that delightful spot is from Barnstaple.

Many motorists who have faith in themselves and their vehicles return to Barnstaple by the reverse way—thus becoming familiar with the district from the two points of view. The interest of the Barnstaple country is as varied as the scenery, historic associations crowding at every point of view, while the architecture of the county, both domestic and ecclesiastical, is full of quaint points and features, that give new impressions to the visitor at almost every turn.

THE advantages of the motor fire engine are certainly becoming more widely recognised, as is evidenced, by the

Touring in Devonshire.—A White Steam Car on Lynmouth Hill.

to close Countisbury Hill to such traffic, but that has been vetoed, and, as we were able to recently announce, it has now been practically decided to make a new road between Lynmouth and Minehead, which will obviate the necessity of the long pull associated with Countisbury and Porlock hills. Both these steep hills have long been familiar to those who follow the motor movement. Only three or four years ago the news of an ascent of these gradients by a motor-car was a matter of public interest and importance; now it is regarded as almost a commonplace proceeding.

A few directions may be useful to those who go that way. Barnstaple is a convenient centre for the excursion. From thence it is six miles to Loxhore Inn, another four and a half to Blackmoor Station, with gradients of 1 in 7 to negotiate, and then a run of nearly eight miles brings the traveller to the scene shown in our illustration.

From thence we commend the trip to Minehead to those who wish to test the power of their cars and their own capacities as drivers. It is an ascent all the way—two miles—to Countis-

bury. That successfully overcome, the road is considerably easier thence to Porlock, ten miles distant from Countisbury. The way should be very carefully taken, for the descent to Porlock is a stiff drop with nasty twists that have to be watched for all the way down. Once again on fairly level ground there is a good road to Minehead, which is about as far from Lynmouth as that delightful spot is from Barnstaple.

The interest of the Barnstaple country is as varied as the scenery, historic associations crowding at every point of view, while the architecture of the county, both domestic and ecclesiastical, is full of quaint points and features, that give new impressions to the visitor at almost every turn.

THE advantages of the motor fire engine are certainly becoming more widely recognised, as is evidenced, by the

The Present Position of the French Motor-Car Industry.

(Concluded from page 652.)

THE question is, are the present conditions in France indicative of merely a passing wave of depression, or is it the downfall of the French? Not a single Frenchman will be found to admit the latter, and, indeed, from present indications, it would be hard to give a definite answer in the affirmative. Depression there certainly is, and this is a result more of lack of business instinct at home, and of relative falling off in foreign demand, than of any possible turning point in the history of the trade or the cessation in the everyday utility of the motor-car.

To get a comprehensive idea of the situation the export trade must be considered in the light of recent statistics. France, undoubtedly, got a long pull in the world's trade in

United States, regarding which French constructors were hoping against hope that fashion and reputation would maintain their lucrative trade in high-powered cars to that country. Figures unofficially circulated seem to show a falling off equal to 30 per cent. in the number of cars. The quantity of cars sent to the United States, however, has never been very important, although the value of components has been, and is still, a large source of trade between these two countries. Exports to Germany have barely increased in proportion to those of previous years, but to other European countries France is increasing her exports. The situation as regards England is well known in that the number of exported cars is decreasing, but the individual power and likewise the average value of the cars is increasing. The main

One of the Cars employed in connection with the recent Military Manœuvres in Holland.

[De Auto.

motor-cars, owing to special conditions which are no longer ignored by those desirous of obtaining a portion of this lucrative trade. The issue of the attempts of trade rivals has been watched at home and abroad with the keenest interest, which has been enhanced by the ever growing needs of the market. Month by month the actual trade figures and their import have been placed before the public and the manufacturers in such a way as left no room for doubt in the minds of the constructors regarding the trend of the future trade in motor-cars. Last year it was evident that Italy was about to make an effort to wrest from the French agencies the best part of the Italian home trade. Italy has succeeded in this desire, for during the present year French exports to Italy have largely decreased, due to the increase in the Italian output. Exact figures established by the French authorities are rather late in appearing, but from indications to hand it would seem that the French exports to Italy have decreased over 50 per cent. during the first eight months of 1907. A similar tale is told in respect to trade with the

increase in net sales to Great Britain is, of course, in parts, and the French constructor who did not seize upon these facts in the early days would almost deserve that his trade would suffer in consequence.

Inasmuch as Great Britain is noted as the great exchange of the world as well as a prodigious consumer and producer, it was scarcely likely that the ratio between British imports and exports in the motor-car trade would be allowed to pass unnoticed. It has been dinned into the ears of French makers by the private efforts of the Société d'Encouragement de l'Industrie Automobile, as the trade association is known in France, as well as by the Press, that however great an *eclat* might be given to the French Salon, its relative importance as a centre of trade was, if anything, inferior to the British shows, and if French constructors have not paid this fact the attention it deserves, it is that their trade returns have hitherto been satisfactory.

There is another phase in French automobile trade which is steadily making way, and will probably become as important in

B

value of trade done as the motor-car factory. This is the specialist in parts, such as carburettors, radiators, wheels, frames, &c. French factories rarely fit bodies to their chassis, the coachwork being ordered outside. Up to now, however, they have largely supplied their own forms of carburettors, coolers, wheels, frames, etc. The demand for low and high tension magnetos brought about the specialist in this line, and from present appearances the carburettor will soon be supplied by similar firms. Clutches, crank shafts, gear-sets, ball bearings, wheels, &c., are mostly in the hands of part makers, and the tendency is still stronger towards this cheapening of production. This year especially several firms have had reason to find their own make of carburettor insufficient for the service demanded, and are changing either to others of their own or outside design. This movement, however, would not in any way affect the prosperity of the trade, but is a sign that competition is beginning to have its well-known effects in the automobile as in other trades.

From the preceding it will have appeared that there are large stocks of high-powered machines on the French market, and that these are mostly in the hands of agents, owing to contract conditions. The constructors have suffered as regards the failure of certain agents to relieve them of their product, and in several instances new trade conditions have been set up as the result of bad faith on the part of the agents. However slack the

A Reminiscence of the Pekin-Paris Run.—The arrival of Prince Borghese on his Itala Car in Turin.

year may have been, it must be admitted that there have been no big failures or bankruptcies in France, which is a plain indication that the growth of the factories, until recently, at least, has not been at the expense of prudence. The general feeling among the public is now, and has been for over a year, that no one should invest in automobile securities or promote new concerns with the hope of large returns. The French capitalist is now a shy bird as regards the automobile business, and the proof is in the fact that several firms—and some of these the best known in France—have appealed to the British Stock Exchange when reconstructing their company by increasing capital or otherwise. The market price of the shares of the French companies quoted either on the Paris Bourse or the London Exchange is 30 to 50 per cent. above par, if we except the electric vehicle combines, which are not in the same flourishing state as their competitors.

Some credit must be given to French makers for the way they are tackling the industrial motor trade in France. The industrial application long lagged behind in France, and even now requires all the careful nursing of the military authorities to instil life into the trade. French commercial firms outside Paris have not been quick to appreciate the economical value of motor vehicles in their business, and inside Paris there is the

eternal question of the artificial price of fuel—at present well over two shillings a gallon—about a shilling of which is municipal and state tax. The keenness of commercial life and practice as known in Great Britain is not so paramount to French methods, and the trader reflects well about such an important step as the acquisition of industrial cars, when the crying need really does not exist. The same thing applies to professional men. Tyres for light cars generally cost in France—good as the roads are—about £40 per annum—that is, a complete set at £10 per wheel. For this sum, in the country, a smart turnout can be kept, and country labour for driving is infinitely cheaper than the specialist in motor-car driving as imported from a city. Doubtless, when French makers seriously study the small and cheap car, and give up their notions in respect to making them copies of their larger vehicles, a demand will arise the end of which would be difficult to foresee, but a practical and cheap small vehicle is only at present produced in a limited quantity by one or two very prosperous firms. Had French makers been ready with good small cars, there would have been no cry of dull trade in France.

To summarise the situation, it must be admitted that this year the slump in prices is the result of general slackness of trade, owing first to the disregard of French makers to the needs of their home trade; secondly, to the changing conditions of French export trade, which has nothing in it at present to justify a hoped-for return to the old conditions. Thirdly, the changing demand for small cars, in spite of the large production of high power vehicles, has completed the trouble of French makers. The redeeming feature of the situation is the immense demand for taximeter cabs both for home and abroad, whereby many of the chassis intended for touring cars have been turned over into the hired cab ranks. Even four-cylinder cars of 16 and 20-h.p. are to be found in their place on the ranks, and, to entice the wary client, it is boldly stated that the tariff is the same as that for the 8-10-h.p. cabs which do such excellent service both to their owners and hirers.

Another detail which adds a cheerful note to the situation is the undoubted demand for industrial cars, omnibuses, both for city and rural service, for which latter the field is immense in France, whereby a slackness of trade in touring cars is somewhat counterbalanced by the brisk business in commercial vehicles. At the tenth annual Paris Salon, the only official exhibition held in France, special effort will be made to give the desired *eclat* to the industrial aspect of the trade, the space devoted in 1906 to this branch of the trade having been largely increased for this year.

It is also believed that the well-known French genius and inventiveness will go far towards keeping France in the van as regards design and construction of motor-cars, and even if the quantity does not largely increase, the quality will be there and the French factories will do well even on present lines. Moreover, if worse days come, there will probably be witnessed a further effort on the part of French makers to produce the *car de luxe* at a high price and in limited numbers, the actual factory cost being high, but the profit being larger still. *Articles de luxe* are well known in France, and the sales of such product can well stand a high rate of profit. True, the reputation for luxury stands the Frenchman in good stead at times, for his *de luxe* is often only what is known as comfortable by his near neighbours.

The large stock of this year's models will probably be gradually sold to agents, and will most of them find their way into agents' hands either in Paris or pleasure resorts on the sea coast, and will do good service for years to come by being let out on hire at prices which may or may not be maintained at the present rather prohibitive rate. And then again, in view of the fact that the coming Salon will not alter the design of cars to a very large degree, the changes being essentially in detail rather than in principle, it is certain that many cars will be dubbed 1908 pattern after the various novel details have been added. But this brings up the question of what the next Salon has in store for the world, and on this point all mouths are mute, which may or may not indicate that extraordinarily good things are in store for those who wait.

ELASTES-FILLED TYRES.

JUST about a year has elapsed since Elastes as a filling for the inner tubes of pneumatic tyres, in place of air, was placed on the British market. Since that time Elastes, Ltd., the company responsible for its introduction and manufacture in this country, have naturally gained a large amount of experience with their special product, as a result of which some changes have lately been made in the mixing of the chemical components of Elastes. The modifications are but slight, but have, we are informed, brought about a considerable

Fig. 1.—Section of Elastes Detachable-Flange Rim.

amelioration both in the resilient and durable qualities of the material.

The most important improvement, however, which has been effected has been the adoption of a detachable flange rim, by means of which the work of mounting the Elastes-filled tyres is not only considerably facilitated, but enables the owner of a motor-car to have outer covers readily changed on his own premises should they sustain any bad cuts, or show any signs of wear. Furthermore, in the old method of mounting with the fixed rim not only were the covers subjected to considerable strain in levering them over the rim edge, but it was also found that in some cases the outer beads of the tyres failed to bed properly in the rim, but wedged themselves into the filled inner tubes in such a way as to subject the latter to a permanent distortion which considerably curtailed their useful life. The utility of the new detachable rim, which is shown in section in Fig. 1, thus finds demonstration in several ways. The fixed portion of the rim A is an ordinary standard one, with the outer edge cut away to the shape seen at C. The detachable flange consists of a weldless steel ring of the section illustrated at E, B being what is termed a return piece which fits in a groove D in the felloe. A ring of rubber, K, is laid in the groove to form a water-tight joint, so that no damp can find its way inside the tyre. The flange is secured in position by twelve equi-distant bolts, F, which pass through holes in the felloe. A noteworthy feature of the construction is that to detach the flange the bolts, and not the nuts, are removed. The latter are of the special form shown in Fig. 1, and are fitted into the inner side of the felloe, and held rigidly in position by means of feather keys G engaging in corresponding slots cut in steel washers H permanently secured to the felloe. This plan of fixing the detachable rim has been adopted to facilitate the mounting of the tyre, as it enables the bolts to get a hold of the threads in the nuts while the removable flange is still some distance from the felloe. One of the illustrations of the group (Fig. 2) shows the method of inserting the *boyreau* in the outer cover; when fully inserted the tyre can be placed on the rim by hand, although it may be necessary to ease the last part of the bead into place by means of ordinary tyre levers. The detachable flange is then secured by starting two or three of the bolts, after which the others are inserted, and as they are screwed home the tyre is gradually pushed into the proper position.

While the detachable flange might be secured by a smaller number of bolts, the Elastes Company prefer to divide the strain over a dozen, and point out that the time occupied in attaching

the flange in the case of Elastes is no greater than that taken in the case of removable rims with a smaller number of bolts and inflating an air tube. As regards adapting present motor-car wheels to the new detachable flange, which is equally well suitable for use with ordinary pneumatic as with Elastes tyres, the main alteration necessary is the provision of a slightly deeper felloe on which the groove D has to be formed. The Elastes Company have found by experience that the use of security bolts in connection with their filled inner tubes are unnecessary, and they, therefore, have ceased to employ them. The holes for the same, as also for the valve, are, however, provided in the felloe, and while usually plugged up, the plugging can readily be filled up should the motorist desire or find it necessary to return to air-inflated inner tubes.

The adoption of a detachable flange has also brought out an improvement in the methods of manufacture. When exposed to the air, Elastes-filled tubes tend to permanently expand, so that it is necessary to stock them enclosed in outer covers fitted on duplicate rims. The mounting of these has hitherto necessitated the employment of special tools and plant, and has been accompanied by the consequent straining of the fabric of the covers to get the beaded edge into its place. The operation is now performed entirely by hand by using a special detachable "storage" rim (Fig. 2), which really consists of two half rims held together by clamps, and on which the *boyreau* is held in place until required. Although the Elastes Company, Ltd., will still continue to undertake the fitting of Elastes tubes to motor-car wheels, it will be possible in future, where it is not feasible to send the latter to the factory, to despatch a *boyreau* on a "storage" rim to the motorist, who, after he has had the necessary alterations made to his wheels, can have the tyres

Fig. 2.—The above group of illustrations show respectively an Elastes-filled tyre mounted on a "storage" rim; a wheel with moveable flange detached; inserting a "boyreau" in an outer cover; the complete wheel and tyre; and the method of easing the last part of the beaded edge over the lip of the rim.

fitted on his own premises and renewals effected with a minimum of trouble and delay whenever the same are required.

THE new Lord Mayor of London (Sir John Bell) and the Sheriffs (Mr. David Burnett and Mr. C. C. Wakefield) were formally chosen amid much quaint ceremonial at the Guildhall on Saturday. Mr. E. Newby asked Sir John Bell a few questions prior to his election, including one asking him to unite with the mayors of the boroughs of the Metropolis to try to do something to protect people on the King's highway from being run down by motor-cars. Sir John Bell answered in the affirmative.

CONTINENTAL NOTES.

Military Motor Roads in Germany.

It is announced from Berlin that the German War Department is considering a project which cannot fail to be of the highest strategical importance, that of connecting the principal towns in Alsace-Lorraine by a new high-road, specially designed for military motor-cars. A start would be made with a road between the river Main and the frontier, Frankfort, Kaiserslautern, Sarrebruck, Metz, and Strasburg being the principal towns *en route*. Later it is proposed to build a road between Strasburg, Karlsruhe, Mannheim, and Wurzburg, and a third between Cologne and Mayence.

A Russian Motor-Car Race.

A motor-car race between Nicolaieff and Odessa, South Russia, a distance of seventy-eight miles, was held on the 21st ult. Twenty-seven entries had been received; only seventeen started, however, and of these thirteen succeeded in covering the whole distance. In the light car section the winner was Luchesi, on a Lion-Peugeot, who covered the distance in 3 h. 7 min. 54 sec. The best time in the section for cars of

of the principal sections in the touring car class were as follows:—Single-cylinder vehicles from 101 to 125 mm. cylinder bore Sizaire (Sizaire-Naudin), 2 min. 42 2-5 sec.; ditto over 125 mm. Guippone (Lion-Peugeot), 2 min. 35 4-5 sec.; four-cylinder cars over 141 mm. cylinder bore Paul Faure (Mercedes), 1 min. 14 3-5 sec., this being the third best time of the day; six-cylinder cars up to 90 mm. bore Busson, on a Busson-Dedeys (a new French-built six-cylinder car), 2 min. 25 2-5 sec.; ditto from 91 to 110 mm. Van Dick, on a Rossel, in 2 min. 10 1-5 sec.; and ditto over 111 mm. bore Jennes, on a Rossel, 1 min. 23 3-5 sec.

A Motor Racing Track for Belgium.

The Automobile Club of Antwerp is interested in a scheme for the establishment of a motor-car race track in the Campine district of Belgium. It is proposed that it should be about five miles long and elliptical in shape. Negotiations for the purchase of the necessary land are now in hand.

A Fuel Consumption Trial.

A somewhat novel competition is to be held in the neighbourhood of Bordeaux on the 13th inst. The event, which is

Some of the Light Delivery Vans taking part in the Commercial Vehicle Trials.

from 12-h.p. to 18-h.p. was made by Pettrilo on a Rochet-Schneider, 1 h. 56 min. 16 sec., and in the heavy car category by Jourevitch on a Mercedes in 1 h. 57 min. 18 sec.

The Chateau Thierry Hill-Climbing Competition.

The annual hill-climbing competition organised by "L'Auto" was held at Chateau Thierry, France, on Sunday last. The contest was held over a mile course on a hill known as the Chesnay, which averages 1 in 10. The hill begins right in the town, and becomes steeper and steeper as the summit is reached. The roads at the turns had, however, been improved and repaired, so that the cars could get round without it being necessary to slow down to any appreciable extent. The best time of the day was made by Olieslagers, who on an Albatross motor-bicycle climbed the hill in 1 min. 7 4-5 sec., equal to a speed of fifty-three miles per hour. In the category for cars built in accord with the rules of the Criterium de France the winner was Blaizot (Martin-Lethimonnier), 1 min. 47 sec. Of the cars of the Kaiser's Prize Race type the honours fell to the Pipe, driven by Jespers, 1 min. 12 sec., the second best time and the fastest in the car section; Emery, on a Benz, being second in 1 min. 16 4-5 sec. The Targa Florio car class was won by Metargy, on a Darracq, in 1 min. 30 3-5 sec., and the category for Coupe de la Commission Sportive vehicles by De Langhe, also on a Darracq, 1 min. 28 sec., Cozic, on an Italian-built Hiss car, being second in 1 min. 45 4-5 sec. The winners

known as La Coupe de l'Autoloc, will be opened to all classes of petrol vehicles. One kilogramme of spirit will be served out to each competitor, and the exact distance run on this quantity of fuel will be carefully measured. The awards will be made on a handicap basis by multiplying the weight of the vehicles in running order by the distance covered, the winner being the car which shows the highest figure. Close on a dozen entries have already been received.

Miscellaneous Items.

A public service of Darracq-Serpollet steam vehicles for the transport of both passengers and goods is being established between Epernay and Pierry and between Moussy and St. Martin d'Ablis, in the Marne district of France.—Already fifty-seven cars have been entered for the reliability trial of voiturettes and light cars which is to be held in France this month.—A public service of motor vehicles is being started between Hofheim and Okriftel, in the Taunus district of Germany.—M. Michelin, the head of the well-known Clermont-Ferrand tyre firm, has just taken delivery of an 18-h.p. Germain chainless car for his own personal use.—The Automobile Club of Marseilles is organising a hill-climbing competition for the 13th inst.—A demonstration of Miraculum, the new puncture stop, was given in Paris last week.—An automobile exhibition was opened in Copenhagen on the 28th ult.—Some trials with motor-buses are now being made in Brussels.

MR. J. MELDRUM, of the Esplanade, Dundee, is letting cars on hire, and has a H. F. vulcanising equipment for dealing with tyres.

THE Urban District Council of Sittingbourne is making an appeal to motorists to drive with consideration through their town, the entrances of which are marked by caution boards.

THE County Council of Kent is about to erect signposts, similarly designed to those in use on the French highways, on the road from Dover and Folkestone to London. These should be appreciated by French motorists on tour.

A MEETING of the Society of Engineers is to be held on the 7th inst., at the Royal United Service Institution, Whitehall, S.W., when a paper will then be read entitled "Liquid Fuels for Internal Combustion Engines," by Mr. Robert W. A. Brewer, A.M.I.C.E., A.M.I.M.E.

THE Essex and Suffolk Foxhounds recently had an unfortunate experience with a motor-car. The pack met at Ardleigh for cub-hunting, and were returning to the kennels, after killing, when the hounds were run into by a motor-car. A valuable dog-hound was killed on the spot.

TELESCOPIC guides and supports, instead of hinges or joints, which can work loose, are used for the wind screen shown in the two photographs produced herewith, so that the upper half of the screen can be raised and lowered like an ordinary window sash, without risk of fouling the steering wheel or any other

HERE AND THERE.

IN the Victoria Road, Swansea, Messrs. Pryce, Trow, Ltd., have a motor garage, where they are stocking motor accessories, petrol, &c.

MESSRS. GEORGE ACE, LTD., of Wind Street, Swansea, are

hiring cars to visitors and also rendering assistance to motorists in trouble with their vehicles.

THE most powerful motor-van employed in the work of newspaper distribution in this country is now being daily used by "The Liverpool Courier." The vehicle, which is a 30-h.p. Daimler, forms a rapid and effective means of distribution.

THE imports of motor-cars and parts into South Africa, according to the returns of the South African Statistical Bureau, amounted during the first seven months of the current year to £69,344, as compared with £66,357 in the corresponding period of 1906.

HENRY COPSEY, a chauffeur, residing at Islington, has been committed for trial at Bromley, Kent, on a charge of the manslaughter of Edward Akers, aged 19, at Peckham. It was alleged that the deceased, while cycling, was knocked down by a motor-car driven by the accused, and witnesses stated that the car was travelling from thirty to thirty-five miles an hour.

A SHANGHAI correspondent reports that motor garages and repair shops are springing up in all directions, and that the number of motor-cars and motor-boats in use, which are mostly in charge of native chauffeurs, is rapidly increasing. Shanghai

ittings in the neighbourhood of the dashboard. The car to which this particular screen is attached is one of those which the Waterloo Motor Works, of Chicheley Street, York Road, S.E., let out for hire to clients, and the body and screen have been made by them.

AT Ascot, a few nights ago a Chobham doctor was re-filling the petrol tank of his motor-car when a lamp held near ignited the spirit, enveloping the car in flames. The owner's son, who was in the car, was badly burnt about the face and hands, and the doctor was also burnt about the hand.

TWO Napier six-cylinder engines, one of 38.4-h.p. (R.A.C. rating) and one of 60-h.p., the cylinder bores being respectively 4 in. and 5 in., were recently submitted to a fifteen minutes' test on the bench at the Napier works. The certificates issued by the Royal Automobile Club, under whose observation the trials were made, show that the 38.4-h.p. engine developed 64.2-h.p. at an average speed of 1,748 revolutions per minute, and the 60-h.p. motor 94.3-h.p. at 1,588 revolutions.

A THREE THOUSAND mile test of a 40-h.p. six-cylinder Napier using Simcar benzol, a British fuel with a specific gravity of .880, and which can be sold retail at the factory for about 1s. per gallon, was commenced on Monday last under the auspices of the R.A.C. with the view of seeing whether the fuel has any bad effect on an engine, or whether it leaves any abnormal amount of deposit. The car is running a daily distance of 150 miles out and home from Hatfield, on the Great North road.

is the only other port in China, besides Tsingtau, where motor-cars can be used with any success. The roads in the settlement are excellent macadam and run for twenty miles into the country.

THE fire-brigade authorities at Berlin have for some time past been making experiments with two motor fire-engines, one being electrically driven and the other operated by steam. As a result of the trials, it is stated that both systems are suitable for the requirements of the German capital, and that the electrical vehicle in particular, on account of its readiness, comes into consideration in the first rank as a substitute for the engines drawn by horses.

USERS of cars fitted with accumulator ignition will be interested in the news that after much experiment the City Ignition Company, of Spencer Street, Goswell Road, London, E.C., claim to have produced a coil which will satisfactorily ignite the charge in petrol motors in conjunction with a two-volt instead of the usual four-volt battery. The makers claim that the new "Voltoo" coil, as it is known, only takes 1.5th of an ampere, giving at the same time a better spark than the majority of four-volt coils. Furthermore, owing to the extremely small volume of the primary current, the difficulty of pitting of the platinum is done away with, thus reducing to a minimum the expense and trouble of constantly renewing, trimming and adjusting the platinum points. We hope to practically test the new coil at an early date.

A SWANSEA solicitor has successfully prosecuted a lad for throwing missiles at his car.

OWING to the improved methods of manufacture and to the increased plant put down at the works in Hanover and Willesden, the Continental Company announce a substantial reduction in the price of motor tyres as from the 1st inst.

A J.P. CAUGHT in the Fenstanton trap asked the police who stopped his car, "Don't you think you can find something better to do than lying in a ditch watching motor-cars?" and was fined £6 and costs by the St. Ives Bench on Monday.

THE Coventry Chain Company (1907), Ltd., Coventry, have lately introduced a new motor roller chain, the feature of which, as will be seen from the accompanying illustration, is the worm

roller. In the ordinary type of chain the rollers are drilled from the solid bar of metal, and, being intact hollow cylinders, are stated by the Coventry Company to have a natural ringing noise, which is claimed to be destroyed by making them of spirally-wound strip steel. Not only is the new departure said to result in an exceedingly quiet-running chain, but also that it affords other advantages, viz., that the rollers being made of strip steel, there is less likelihood of fracture, owing to the grain of the metal following the circumference; that the metal, being in strips, can be obtained of an absolutely uniform character, and that it can be uniformly case-hardened on all its surfaces. While a chain running in perfect alignment on well-designed sprockets and kept well adjusted should give little or no trouble on the score of noise, it is quite true that when these requirements are not met, especially in the case of worn chains, some cars have a tendency to become unduly noisy, and any new attempts to overcome the difficulty are well worthy of attention. The behaviour of the Coventry Company's new chain in actual use will consequently be watched with interest.

A 24-HOURS road race was held on the 7th ult. on the reconstructed racing track at Morris Park, New York. The event was won by Bernin, on a 35-h.p. Renault, who covered 1,079 miles in the time; Smelser, on a 40-h.p. Lozier, was second, with 972 miles to his credit; Kilpatrick, on a 35-h.p. Hotchkiss, third, with 892 miles; and Campbell, on a 35-h.p. Allen-Kingston, fourth with 681 miles. The five other cars which started failed to finish.

THERE will shortly be placed upon the market, states the 'Industrial Motor Review,' a new field motor designed for ploughing, mowing, reaping or hauling. Ploughing, however, will be performed on the double engine system, a master device having been patented which permits of two motors weighing not more than five tons negotiating a heavy four to six furrow balance plough without possibility of the motors being pulled out of position.

AN innovation in motor auctions will be made on Saturday, the 26th inst., when Messrs. Hampton and Sons, of Cockspur Street, London, S.W., will inaugurate a series of sales on the Brooklands track at Weybridge. We understand that the firm only intend accepting cars for sale when they have satisfied themselves that they can be recommended to purchasers, who will also be given an opportunity for the trial of vehicles on the already famous course.

THE receipt of a catalogue of heating stoves from Messrs. Walter Berry and Sons, of Downing Street, Manchester, reminds us of the approach of the winter season, when in frosty weather special attention must be devoted to the heating of the motor-house to prevent troublesome and costly additions to the repair bill owing to burst cylinders. Messrs. Berry make a variety of stoves; a speciality, however, is their combination of a gas-heated hot-water boiler and radiator, the former being located outside the motor-house and the latter inside.

A FIRE has occurred at the motor body works of Messrs. Harper, in Broad Street, Wolverhampton.

THE Tasmania Motor Company, Ltd., is erecting new premises at Launceston, and is developing its automobile business generally.

THE first motor auction sale at Doncaster has just taken place in the hall erected by Messrs. Jackson and Co., of the Hall Gate Motor Garage.

THE ancient and interesting Eastern counties borough of Beccles is the subject of an illustrated handbook recently published by Mr. A. E. Mickleburgh, of the Waveney Press of that town. The picturesque gabled houses, the winding river, and the general environment of Beccles are illustrated in a series of well-executed half-tone views. There is also chronicled a well-written history of the town from the time of the borough's charter in 1584.

THE latest bulletin of the White Company deals largely with the progress made in the works during the last seven years. It also contains a description of the new factory where the well-known White steam car is made. The illustrations give a graphic idea of the extent and equipment of the works, everything being of the most modern description. An account of the technical features of the car is also included in the list, which, like the vehicle it represents, is about as good as it can be.

AT the R.A.C. Exhibition, Aston Lower Grounds, Birmingham, on the 17th ult., a series of tests were made with the New Era petrol fire extinguisher. The trial took the form of the extinction, in from four to twenty seconds, of huge blazes produced from such highly inflammable materials as shavings, tar, petroleum, and cans of petrol. In each case the result was the same—a jet from the New Era utterly annihilating the flames when at their hottest. The demonstration was a great success, and afforded convincing proof of the merits of the appliance in use.

THE accompanying illustrations show a neat spare tyre carrier equipped with a 36 by 5 in. tyre and fitted to a six-cylinder "Thames" car. The chief feature of the arrangement, which has been devised by Mr. W. T. Clifford-Earp, is the absence of unsightly arms and stays when the carrier is not actually in use. The position in which it is placed has a decided advantage over the standard side fixing, which prevents access to

the driver's seat from the off side, and interferes with the easy manipulation of the gate change speed, besides detracting from the general appearance of the car. It will be noted that the lower stays are folded down and are quite inconspicuous when no spare tyre is carried; the upper stay is hidden by the Cap's cart hood. No part of the tyre is in contact with the back of the car, so that damage to paint and varnish is impossible. The carrier is being fitted to all standard six-cylinder "Thames" vehicles.

ALAS! Gloucestershire has fallen into line with Surrey, Sussex and other police-ridden districts, the first trap in the county having been set on the day that the Auto-Cycle Club recently intended to have a competition on Birdlip Hill.

THE CLOTHIER AND THE CAR.

WHEN on the memorable run to Brighton which awakened our people to the knowledge that the legal restrictions on the automobile had been removed by a tardy Legislature there was much amusement at the eccentric appearance of those who occupied seats on the cars, whether as drivers or passengers. Many of the wayfarers resembled bears and other animals favoured by nature with hairy coverings to keep out the cold. Others appeared clad in leather raiment, and stiffly walked about shiny and strange to the spectators, who grinned and gaped at the curious medley of men and machines.

The wonderment they caused has quite subsided; motoring has become one of the orthodox methods of progression, and those who delight in its joys resemble other men. Especially is the fact apparent at such a time as the present, when the motorists' clothiers are relegating dust coats to the rear and bringing out "warm winter clothing" that shall protect those who motor from the stress and storm of our English climate and yet be unobtrusive to the public. In short, the motorist wishes

The Dunlop Rubber Company's Latest Style.

to appear as other men, clothed in garments that shall not attract the notice of small boys in November.

Now that leading sartorial firms have come to his assistance in this matter the motorist may congratulate himself. He is well provisioned in this respect; and not only are the houses that originally set out to supply accessories looking to his wants with regard to clothing, but the fashionable tailors are becoming equally solicitous to supply him with specially designed clothing. Their advent to the industry has probably had something to do with the displacement of leather and furs from the early favour, although both are still used, and large quantities of fur garments can be seen in West-end showrooms. Latterly Irish frieze has been most in favour for gentlemen's clothing, and liveries in meltons have been the rule. In each case this is an advance for master and man.

But perhaps the best method of illustrating this development is to mention one or two leading designs of some of the principal firms engaged in the business, reserving to next week reference to other well-known houses that have contributed to the improvement in design that has been so noticeable during the last season or two.

THE DUNLOP RUBBER COMPANY, LTD.

THE Dunlop Rubber Company, Ltd., of Manor Mills, Birmingham, have become specialists in motor clothing, and an inspection of their goods reveals the fact that all the productions in the way of raiment have been designed by a practical motorist. We all know the weakness of the local tailor in attempting to design clothing really protecting from inclement weather. He is apt to give his mind solely to the provision of ample amounts of material, on the principle that if there is the quantity of cloth in a coat it must be

A Speciality of the Dunlop Rubber Company.

warm. The cutters of the Dunlop Rubber Company, however, while never stinting their material, do not give a garment an ounce of unnecessary weight. Even the stoutest, most weather-repellant coat they build is pounds lighter than many garments of similar design and warmth. Everything they produce has been designed, cut, and put together by people who know just how loose, how tight, how warm, and how heavy it is needed to be to afford maximum protection, yet be free from any suggestion of encumbrance of movement or limitation of freedom, walking or riding.

A. W. GAMAGE, LTD.

MESSRS. A. W. GAMAGE, LTD., whose motor department is one of the chief features of the great building in Holborn, have brought out a

The lining of Gamage's "Motura" Coat ready to attach. Attaching the lining and finishing the operation.

new coat known as the "Motura" for the season. This is made in real Irish frieze and has a taking cut and finish. An important point in connection with this garment is the detachable lining, this being attached by a very convenient form of fastening by means of which the coat can be made complete with the leather lining fixed inside the coat in less than a minute. It is as easily detached in mild weather,

D

and, without the lining, the coat will then give sufficient warmth. In these changeable days, when warm noons are succeeded by cold and chilly nights, the idea of the detachable lining is one to be recommended, and the way in which it is worked out in Messrs. Gamage's speciality is certainly admirable. The "Motura" coat is also made in light-weight Scotch homespun. Another excellent garment is the firm's "under-coat," made in camel fleece, tan leather and chamois leather. This is suitable for either lady or gentleman. It is easily put on or taken off and can be regarded as a wrap to give protection against colds and chills without the appearance of being a motor-coat. In addition to other lines of motor clothing for adults, including Russian foal skin coats, special attention is devoted to juvenile attire, in which several good styles can be seen in Holborn. Those in grey goat and cheverette goat skins are notably effective both from the points of utility and appearance. A large department is also devoted to motor clothing for ladies, the various garments all being cut and designed by experts. The "two-in-one" coat is specially designed to combat the piercing wind and rain. This is made in a choice selection of Scotch and Irish tweeds and showerproof covert coating. It is warm and comfortable and light in weight. Messrs. Gamage's list contains illustrations of these clothes and the book will be of interest to all ladies.

AUTOMOBILIA.

In the heart of the West End is the establishment of Automobilia, Ltd., with finely-positioned showrooms at 532, Oxford Street, W., nearly opposite the Marble Arch. Here is a fine show of clothing of high degree for both ladies and gentlemen. The department is under the sway of an expert, a man who has seen the evolution of the motor garment as already referred to, and who has, moreover, ministered to the change in a very marked degree. We illustrate two of his most effective and latest designs in ladies' clothing, combining ideas of shapeliness, comfort, and lightness, with the wind and rain-rejecting qualities that go to make up the perfect garment. The "Mercedes" coat is leather lined to the waist, and presents a handsome appearance, while the ladies' coats generally are made in good serviceable cloth, although one particularly striking pattern in green leather is so well worked up as to look almost like cloth—a novel idea that will be of interest to many of our fair readers. In men's clothing the "Auto" coat first deserves mention, this being a type which is of remarkably good value and design. It is made of Irish

frieze, and is lined with chrome dressed leather, fitted with Prussian collar and gauntlet cuffs. The collar can be quickly and easily manipulated to allow the coat to be used for ordinary walking purposes, and is only equalled in popularity by the "Brookland," which is of somewhat similar design, but has a special detachable lining, such as is being successfully introduced into clothing. Thus the coat can be equally serviceable in spring, autumn, or winter—a range of adaptability that gives it favour among a large section of motorists. In liveries for drivers, Automobilia, Ltd., have several good suits in superior blue or green Meltons, and their cleaning suits and overalls are excellent for use in the garage. In addition to the wide range of motor garments, such as coats, the firm have many good styles of caps, &c., all made under personal supervision, and embodying fashionable ideas with regard to the head-dress. Reverting again to the coats as a distinct feature, which has given Automobilia, Ltd., such a high position among tailors, we may mention that advice is freely given both with regard to the owner's garments and the chauffeurs' livery.

CHAS. BAKER AND COMPANY, LTD.

At the Motor-Car Exhibition, Messrs. Chas. Baker and Company, Ltd., were able some years ago to make a successful debut to the motoring public with designs of clothing that indicated practical knowledge of the requirements of the man who drove and the man who rode on cars. The styles with which they commenced have been well maintained in design and finish; the experience of the recent seasons having enabled them to keep well abreast of the time in this respect. Irish frieze has undoubtedly merits in the eyes of motorists, withstanding rain and inclement weather. One design for the winter is lined with tweed and introduced to the public at a reasonable rate that should command attention from those of an economical frame of mind. Tweed coats lined with leather and designed so that they have somewhat the appearance of ordinary garments when walking are another line in which the firm excel. Chrome leather linings of the detachable order are a feature of the goods for the new season, and both for quality and style Messrs. Baker and Company, Ltd., have come well to the front, their establishments in Holborn and also in the Tottenham Court Rd., W., being well-known to motorists.

Not only is the firm meeting requirements of gentlemen motorists but their ladies' coats present features that should appeal to lady motorists. Among these is a chrome leather three-quarter coat in cream or brown, of stylish appearance. In other sections of the business will be found special lines in liveries for drivers, which have the merit of being neat and serviceable, without the ostentatious display that was once associated with chauffeurs' clothing. The new designs in these liveries in blue or green army cloth, have distinctive styles likely to be appreciated. Heavy overcoats for the winter are also made to match.

ROBINSON AND CLEAVER.

In their large establishment in Regent Street, W., Messrs. Robinson and Cleaver have a special department for motor accessories and clothing. The latter is of interest as illustrating what skill and enterprise can do for the motorist when combined with the practical knowledge without which no tailor can bring out a garment that shall be thoroughly satisfactory in all its details to the modern motorist. They, too, recognise the value of Irish frieze as a material for clothing, and have been able to introduce various little ideas giving a distinctive character to their garments. An attractive design shown us on the occasion of our visit was a frieze coat of special value with a storm collar and wind cuffs, securing ample protection from the weather. These are made in a quality and pattern suitable for drivers. For wear under the ordinary overcoat an attractive chrome leather garment has been devised. This is double breasted and loose fitting and will solve a problem of some difficulty to motorists. A chamois waistcoat with sleeves has had considerable vogue and is likely to continue its popularity. Liveries and clothing for boys are also in the range of production of Messrs. Robinson and Cleaver, whose association with the motor industry is a matter of considerable importance.

MOTURING IN SKYE.

RECENTLY the secretary of the Scottish A.C. supplied a member with information regarding access to the Isle of Skye with a car. Two possible routes were suggested:—

1. *Via Glenshiel to Dornie*, and thence by ferry to Lochalsh, and by ferry to Kyle Akin.

2. *Via Dingwall to Strone*, thence by ferry to Strone Ferry—thence to Lochalsh, and by ferry to Kyle Akin.

One or two comments on these may be of service to other motorists going thus far north. *Via Glenshiel*.—I tried this, but the weather was shocking, and the road up the glen soft and difficult, so I turned back. The objective should be Totaig not Dornie, since the latter place is hilly and dangerous, whereas that to Totaig is only undulating and has no steep ascents. There is a good ferry-boat plying between Totaig and the Kyle of Lochalsh. The ferry-boat from the latter place to Kyle Akin is not a large one; my car has a 9 ft. 6 in. wheelbase, and it was only just accommodated; the transport of a longer car would be at some risk to the car. *Via Dingwall to Strone*.—Undoubtedly the better route, road fairly good all the way. From Strone Ferry to the Kyle of Lochalsh the road is soft and sandy in stretches—and there is a very steep ascent with a dangerous descent.

The route to Skye *via Kyle Rhea* is impossible, as the road from Glenshiel, after leaving the Totaig road, passes up the extremely dangerous hill called Mam Ratachan; it passes up with five acute elbow curves, and I am told it is unfit for vehicles of any kind.

The Skye roads are of the second variety, with occasional stretches of good surface. The road from Kyle Akin to Portree has generally a fair surface, but, with one exception, the hills are not worse than those on the mainland. The exception is a hill between Broadford and Sligachan called Druim nan Cleochd. This has a stiff gradient with one right-angled turn; by themselves they would present no difficulty, but the surface is made of loose sandy gravel, two or three inches deep on the steeper parts. My car has been up twice without trouble, and has thereby become notorious, as I understand that lately no other cars have got up without assistance. (Anyone who wishes to avoid the road should take the mail steamer from Lochalsh to Portree; it sails daily at 2 p.m.) The ascent of the hill from the Sligachan side is stiff, but any car could manage it.

Sligachan to Dunvegan *via Struan*.—Good road, probably the best in the island.

Portree to the Quirang.—Second class to Uig—thence rough, with a long ascent, not severe gradient, but very heavy going, owing to the peaky nature of the "Formation." It is astonishing how these peaky roads delay a car. The same kind of road is found when driving from Sligachan to Glen Brittle, fourteen miles, the first three for four on a main road, then into the moorland type, streams to ford, doubtful wooden bridges to cross. One very steep descent into Glen Brittle, dangerous.

On the whole, I was agreeably surprised with the roads, and do not regret taking my car over. At the same time I recognise that it is too heavy for some of the roads (26 cwt. unladen) and that with a 10 or 12-h.p. modern car I should have had an equally good time and been able to travel much faster and more easily. A single-cylindred car would do well.

I went to climb, and for that purpose the Glen Brittle road is the route, as it leads into the heart of the island. Any other climber who wishes to use a motor should bring a 10-12-h.p. light car. The only doctor in the island flies about on a 10-12-h.p. Humber.

Correspondence.

[Letters to the Editor should be addressed to the offices, 87-88, Charing Cross Road, London, W.C.]

RACING AT BROOKLANDS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—On opening my morning paper a few days ago I was considerably startled by a headline announcing that "Mr. Edge Defies the World." On reading the announcement I saw that Mr. Edge, in despair of finding anyone to race against him for the sum of £1,000, had decided to increase the stakes to £10,000 on each side. My friends assure me that Mr. Edge does not seriously mean to race anyone but is only amusing himself by issuing challenges to the world, and that I shall find that some impossible conditions are attached to this challenge, that he does not mean to compete against racing cars but only against touring cars. I cannot, however, believe this, and I take his challenge as seriously meant, and in the same spirit I am willing to accept it.

I am quite willing to race him for one mile and for 500 miles, the stakes in each race to be £5,000 a side. In the one-mile race I believe that Mr. Edge has only one really fast car, therefore I am quite content to race Mr. Edge with one car only. If he prefers to have three, he can do so, and if any one of his three can beat my one I am quite content to lose. For the race for 500 miles I have only three cars, therefore I would ask Mr. Edge to limit his team to the fastest three cars. The only conditions that I must insist on being adhered to are that both races are run under the recognised International Racing Rules, i.e., the rules that are laid down for the principal continental races. The three principal races on the Continent this year, the French Grand

Edge that he has not won almost the whole of the events competed for at Brooklands. He has devoted much time and trouble, not only to the preparation of his cars, but to advice as to the best method of classification, which Mr. Edge is clever enough to realise is of infinitely more service in winning races than is the actual preparation of the cars. He is certainly to be sympathised with on the failure of the 90-h.p. Napier to win the biggest event so far competed for at Brooklands, viz., the Montagu Cup, value £2,000. Even the nicest calculations sometimes go wrong when one remembers that the maximum dimensions allowed for this race were 235 and that Mr. Edge's Napier car came in at 234.6, having therefore an advantage of about 20 per cent. over other competitors before the start, and that also the only car which was certain to beat Mr. Edge's Napier, because it had always beaten it, viz., Mr. Lee Guinness' Darracq, was debarred from competing because it happened to be slightly in excess of the dimensions allowed for the race, which were very considerably closed immediately the Napier car was let in. Now all this was very considerate to the English manufacturer, and it must have been a source of much annoyance to Mr. Edge that after such nice calculations had been made in regard to the dimensions allowed for the race his car should have the misfortune to break down and a foreign car to win the event. Possibly when the car can be induced to go fast again we shall then have the second long-promised Montagu Cup race.

When the proposal was first mooted to the various competitors of making classes for standard sizes of cars to be competed for each

The Meet of the Lincolnshire Automobile Club at Cleethorpes.

Prix, the Circuit des Ardennes, and the Brescia Race, were all run under the conditions laid down by the French Automobile Club for this year's Grand Prix.

The French Automobile Club is the recognised head of International racing affairs, and as such I cannot think that Mr. Edge can have any objection in racing under the conditions as laid down by them for this year's Grand Prix. If Mr. Edge considers that his six-cylinder cars are at a disadvantage owing to their petrol consumption, I am quite willing to revert to last year's International Racing Rules which governed the Grand Prix, and which, as he knows, were restricted by the weight of the car only. These rules were practically the same as governed the Gordon Bennett Race.

One of my friends tells me that Mr. Edge wishes to race on the conditions which governed certain races which have been held at Brooklands, and in which races the Napier cars, it is hardly necessary to say, have been successful. If this is all Mr. Edge's challenge consists of, then in my opinion it is no challenge at all, but if Mr. Edge seriously wishes to have a race I am quite willing to meet him as stated above, and it may also comfort Mr. Edge to learn that I am quite content to run in the long distance race three of what he is pleased to term obsolete four-cylinder cars. I may also inform him that these cars are not even new cars, but were built for last year's French Grand Prix. The whole of the four cars that I would race against Mr. Edge would be Darracq cars, and I think the event, if Mr. Edge is agreeable to my proposal, would settle once and for all the question of whether or not the Napier or the Darracq car has the best justification for claiming to be the fastest racing car in the world.

This letter is not written in any spirit of disparagement of either Mr. Edge or the Napier cars. My sympathies are entirely with Mr.

meeting, which classes were to be 26-h.p., 40-h.p., 60-h.p., and 90-h.p., the proposal was unanimously agreed to, but it was on the understanding that these classes were only intended to come into force next season, by which time everyone would have had a chance to build cars to compete in these classes, and therefore there could be nothing unfair in whatever sizes were selected, but it was never anticipated that these classes would be immediately put into force and be competed for during the present season, as it was apparent to everyone that barring Mr. Edge no one had cars which could compete with any chance of success in either the 40-h.p. class or the 60-h.p. class, and that any events run under such heading were practically in the form of a free gift to Mr. Edge.

Although I myself entered cars in each of these two classes at the last meeting I only did so to support the same and to try to prevent the classes falling through. I protested to the secretary at the time of my entry, stating that I did so with the full knowledge that I had no chance of success owing to my cars being so much less than the Napiers. I informed him that both events were foregone conclusions for the Napier cars on the formula adopted, and also that the five mile handicap was a gift to the same vehicles.

Commendable as is the idea of favouring the British manufacturers, surely it is not sport when carried to such extremes as this. Capital entries were secured for the opening meeting and several of the best known Continental drivers came over to compete and everyone seemed anxious to give the venture their support, but what do we find as the result after several meetings? Almost all the principal people have withdrawn from supporting the meetings. Surely there must be something wrong when the Daimler Company abstain from competing. Again, Mr. Jarrott did his best in supporting the meetings with his De

Dietrich cars, but he also is now abstaining from competing. Again, the Fiat Company, who have won all the big Continental races this year, supported the first meeting, and sent their best driver over, but since then they no longer compete. In the face of all this we again see the extraordinary mistake made for the last meeting of the year keeping to these same classes. It will astonish me very much if either the 40-h.p. class or the 60-h.p. class obtain any entries outside the Napier cars.

As a member of the Brooklands Club, and I think I may justly say a good friend of the club, I have supported the meetings in every possible way, and, apart from Mr. Edge, I have entered more cars and paid more in entrance fees than anyone else, but without the knowledge that Mr. Edge always had that many of the races for which he was entering were practically gifts to him. I have tried to explain to the gentlemen who frame these classes that this is not the way to achieve success, and that, however anxious they may be to please Mr. Edge, by overdoing so they have caused the rest of the competitors and the trade to hold aloof.

Next year, of course, there will be nothing unfair in having these classes, as by that time other manufacturers will have been able to build cars to come up to the maximum dimensions allowed, and I do not think we shall then have quite so much of the Napier successes. It is sincerely to be hoped that the classes will not then be altered.

If Mr. Edge agrees to my conditions, I am quite willing for the race to take place any time during October, and that the stakes be immediately deposited with Lord Lonsdale, the president of the Brooklands Club, and all questions of details left absolutely to the discretion of, say, Lord Lonsdale and Colonel Holden, two of the stewards of the Club. In regard to the time-keeping for the short distance speed race I would suggest that we have the official timekeepers of the French and English Automobile Clubs. To conclude, should Mr. Edge consider

Mr. Chas. McArthur, M.P., on the 26-30-h.p. Argyll Car supplied by Argylls Liverpool, Ltd., for use during the political campaign in the Kirkdale division of Liverpool. Mr. McArthur is seated immediately behind the driver.

he is placed at the smallest disadvantage by the conditions stated by me I am willing that he should pick out his fastest cars and I will do the same, and we will waive all question of rules or conditions whatsoever and let the race be unconditional, the fastest car to be the winner irrespective of either petrol consumption, weight, or engine capacity. I do not know that Mr. Edge can possibly wish anything fairer than this. —Yours truly,

A. HUNTLEY WALKER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest "Spectator's" letter in last week's Journal. I was a witness of the terrible accident that occurred at Brooklands, and from my point of view I think that the driver of the Napier car who caused the accident ought to be severely censured for failing to stop on the proper side, according to the regulations. If the driver of the Napier covered two-thirds of the track without a tyre surely he could have gone a few yards further and stopped without getting in the way of the cars behind him. —Yours truly,

A LOVER OF FAIR PLAY.

PETROL IN MANCHESTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to put your readers on their guard against some of the stuff that is sold in Manchester under the name of "petrol." I was in Manchester early last week with a 40-h.p. Weigel, and on applying at the garage which I used for petrol, my mechanic was told

that the only spirit he could obtain was some local brand, none of the well-known brands being available. I do not quite know what this particular spirit is, but it has a very peculiar odour, something like naphtha, and on pouring some of it into the hand it does not evaporate but lies there like paraffin oil.

I found that in order to start the engine on the several occasions that we had stopped it in a journey of about 600 miles all the air had to be shut off from the carburettor, and that the air supply port had to be stuffed with a sponge cloth in order to get the engine to fire. Not even when the motor was warm would it start readily with this peculiar spirit, and next morning, on examining the low tension plugs, I found they were covered with a peculiar scale, rather light in colour and resembling lava.

The odd part of it was that this petrol was sold to my man in tins painted the colour of and bearing the name of a very well-known brand of petrol. I hold no brief for any individual brand, but certainly think that, as a matter of public interest, your readers ought to be warned of the facts that I have stated above. —Yours truly,

C. E. WHITTAKER.

TYRES AND TYRE INFLATION PRESSURE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No doubt we are to believe the motoring public owe a debt of thanks to Mr. Edge and the Dunlop Company, for the interesting experiment regarding tyres recently conducted at Brooklands. The results, however, are so obviously what might have been expected that, except for the advertising value to the two firms interested, they can carry no weight.

We have learned nothing more than what we already knew, and it is only logical to assume that the highest speeds would be attained with the front tyres as hard as it is possible to inflate them, and the rear tyres just hard enough to allow a sufficient adhesion for driving purposes. The road adhesion on the front tyres is so much lost power, consequently, if the tyres could be shaped like a V with the point in contact with the road surface, the traction effort necessary to propel the car would be very small, especially over a surface such as the track at Brooklands. Consequently the speed would be greater.

The reports I have read do not say whether square and round tread combinations were tested for their relative merits. The ideal combination for a touring car, which after all is of much more consequence and real interest to the average motorist, is a square tread on the driving wheels and a round tread on the front wheels, all pumped to the highest pressure recommended by the tyre makers for that particular size.

With the round tread tyres on the rear driving wheels whilst travelling at such high speeds as were used in the trials the "slip" due to road vibration is very noticeable if the tyres are hard, consequently it was found advantageous to reduce the pressure to 90 lbs. This had the effect of cushioning the shock and allowed the driving wheel to remain in contact with the road surface a longer time, thus permitting a more even and more constant transmission of useful power. If a reasonable speed had been tried in conjunction with a car of moderate power, fitted with a heavy touring body, I am convinced the results would have been very different to the conclusions which the originators would have us believe they arrived at. From a racing point of view no doubt the test was regarded as necessary in order to verify an opinion already arrived at, but for all practical purposes the published results are misleading. —Yours truly,

CECIL LAMB.

A STEAM CAR ENTHUSIAST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "H. J. C." asks in your issue of 21st ult. "why there is such a prejudice about steam cars," and to show the absurdity of it he relates how he drove the purchaser of a heavily-laden three-year-old 10-h.p. White steam car from London to Grimsby in an afternoon without the slightest mishap and with a luxury of motion that delighted the passengers. Such runs, however, on up-to-date steam cars are nothing wonderful, they are done every day; but, in spite of the present perfection—I want absolute perfection—of the steamer, a certain prejudice still remains in the mind of the public that they are unreliable and not to be trusted. Why?

The advent of the Locomobile several years ago, which was thrown on the English market at an absurdly low price, £150, without any of those essentials that had to be added to make the car reliable, as they were always breaking down from want of them, poisoned the mind of the public against steam to such an extent that the petrol car makers had it all their own way, and took every advantage of the position by boycotting them in the Press and in open competition, and so the public were kept ignorant for a long time of the improvements that were being made in the steamer, and unable, therefore, to form any opinion as to the value of them.

Things, however, are gradually changing, and steam, which holds the world's records for hill-climbing and speed, is gradually forcing its way to the front, after many years of great opposition and unsportsmanlike hostility. Only last week in one of the daily papers it was stated that Mr. Lee Guinness on his 200-h.p. car did a mile at the rate of 114 miles per hour. At the end of this paragraph it certainly stated this speed was not a world's record, which stood at

127½ miles per hour, but no mention was made of the fact that the car that did that wonderful speed was a 30-h.p. Stanley steamer.

There is nothing for the public to fear now about steam cars, of which there are many fine makes on the market. There is no comparison between them and petrol cars of double the power for what they can do and the way they do it, and they do their work without "talking." There are no gears, clutches, or electrical connections to trouble about and the latest cars are practically fool proof. It is positively delightful to ride on a steam car, as those who have had that pleasure can testify. I believe that if half the money and a quarter of the brains had been spent on steam that has been spent on the internal combustion engine there would be few of the latter on the road.—Yours truly,

J. C. P. PERRY,
Major, R.A.M.C.

SUBSTITUTES FOR PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would you or some of your readers be kind enough to give me some information about benzole? Some weeks ago, a correspondent gave some account of it, but I did not take any particular interest in it at the time, believing it unobtainable in my district. What I wish to know is, can it be used through an ordinary carburettor, what is the difference in mileage per gallon, and does it have any bad effects on valves, such as pitting badly, or inside cylinder walls?—Yours truly,

F. W. HODDER.

[Our correspondent's enquiry was apparently anticipated by Mr. B. F. Rider, of Leeds, whose experiences in the use of benzol were recorded on page 646 of the last issue of the *M.C.J.*]

MOTORISTS AND TOURING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think members of the Motor Union have a grievance in that, whilst members of the R.A.C. can pay their customs deposit and receive their driving licence and registration numbers before taking their cars across the Channel, the Motor Union, with a much larger membership, apparently cannot give them this facility. The assurance that the Motor Union will recommend an agent who will assist members through the formalities is not much consolation now it is generally known that these agents meet the boats and will equally see members and non-members through. Nor the fact that someone, if not the R.A.C. company, will charge a commission on the deposit. That the deposit will be made in English money and returned, as the member is embarking, in foreign currency. That he will, after possibly wasting some hours, have to drive with temporary permits till the proper ones can catch him through the post, or he picks them up on his return to port of departure (if they have not miscarried in the meantime).—Yours truly,

J. M. B.

WHEELS FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re your correspondents, Messrs. A. E. Gelder's and O. Cook's letters anent wheels for motor-cars, they apparently have not yet heard that there is a solid-tyred wheel which fulfils all Mr. Cook's requirements, namely, unpuncturability, low cost, &c., and which, moreover, is guaranteed for three years so far as the wheel is concerned, and for a minimum of 10,000 miles tyre life, about four times as long as the average life of a pneumatic. The peculiarity of the combination is that the shock is absorbed at the periphery of the wheel like a pneumatic, consequently it is suitable for speeds far in excess of forty miles an hour. There are no springs or buffers of any sort, the principle of its action being entirely new. Naturally I cannot describe at length the action, as I should be trespassing too much on valuable space, but the wheel I refer to is the Lynton.—Yours truly,

ERNEST H. ARNOTT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am afraid that it would take too long to answer all Mr. A. E. Gelder's statements, and I rather think that we should be overlooking the real question at issue, viz., the necessity of providing a wheel or tyre for all-round use on a motor-car. The majority of motor users agree that something more is wanted. Speed against safety and weight is not demanded, else they would not so readily use the heavy leather bands. Comfort is of the greatest importance, because it means that vibration is diminished. Safety is another important item, so it must not be liable to bursts or side-slips. Cost must be reduced if we are to retain the average user, for, as Mr. Bryant says, "The motor-car, less expense of tyres, is the cheapest form of locomotion, plus tyres cost the most expensive."

Each year increases the need of such a tyre. Surely it will soon be produced! Will fashion allow it to be used?—Yours truly,

O. COOK.

POLICE COURTESY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had a different experience to "A Motorist" in your last issue. My light went out in Brighton, and I was getting down to relight it when the "man in blue" hove in sight. He took my name and address and looked at the licence and was almost apologetic over it. I received a note from Mr. Gentle, the chief constable of Brighton, asking me not to let it occur again. This is only in accordance with what I always hear concerning him, but it is distinctly worthy of note that one chief constable at any rate recognises such occurrences are accidents and that we do not do it for amusement.—Yours truly,

ROVER.

A CHANCE FOR A GARAGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Knowing of the great interest you take in all matters connected with motoring, I venture to trouble you with this letter. I am anxious to start a motor business in a small place on a main road (in England), on the following lines:—

(a) To open a shop stocked with motor accessories, including covers, tubes, petrol and oils, &c.

(b) To employ a mechanic capable of dealing with small repairs and adjustments.

(c) To keep a motor-car for hiring out, with driver.

I should be so glad if you could kindly help me by indicating a place suitable for me to try my luck on the lines suggested.—Yours truly,

F. V.

[Our correspondent will probably find that most places are already served in this respect, or perhaps some reader can supply the information desired.]

Bosnia and Herzegovina has recently adopted a new postage stamp, on which a motor mail van is the subject of the illustration.

A MYSTERIOUS NOISE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or any reader of the *M.C.J.* could assist me in overcoming a difficulty experienced in my car. It is fitted with a 6½-h.p. single-cylinder engine, and when I put the car on top speed it knocks or gives a sharp clink every time it fires, no matter how much I retard the ignition. The moment I put it on the lower speeds the clinking stops. It is only on the top speed that this happens, even when the car is going full speed.—Yours truly,

KINGSTONIAN.

[The clinking noise is no doubt caused by the cardan shaft having become worn, and would only be detected when the car is on top speed, this because the engine is running much less rapidly than when on the lower gear, and, in consequence, would give an uneven transmission, which is overcome when the engine is running at its normal speed.]

A NOISY CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be obliged if you will kindly inform me of a remedy for the air intake of a carburettor making so much noise; can I fix my carburettor so that it will work quietly, or will I have to get a new one? It seems to me there ought to be some way to silence the noise.—Yours truly,

R. J. SIMPSON.

[The air intake of a noisy carburettor may be silenced by means of a miniature silencer being fitted, this to entirely cover the present opening. If carefully fitted, this should remedy our correspondent's trouble.]

SCOTCH COURTESY.—From C. D. L. comes correspondence in reference to an incident which occurred at Braemar in August; but it scarcely seems within the limits of newspaper controversy.

CLUBS AND ASSOCIATIONS.

JUNIOR AUTOMOBILE CLUB.

THE Junior Automobile Club's "Agnes Wood" Challenge Cup was contested for on Saturday. The conditions of the competition were that the trophy should go to the driver making an absolute non-stop run for 150 miles, except for replenishing with oil, fuel, and water at the half-distance, but the engine had to be kept running the whole time. There were three starters—Mr. C. W. Brown, Mr. Chester Fox, and Miss Agnes Wood—all driving Rover cars. The course was from Barnet to within five miles of Coventry and back, and the speed was checked at several points. The competitors were started at four-minute intervals. All made non-stop runs, and approximated so closely to the stipulated speed that it was a difficult matter for the officials to decide the winner. This proved to be Mr. Brown, who at some of the controls was only a few seconds at variance with the schedule, and whose total time in excess of schedule at various points exactly equalled his total time behind schedule at other points. Mr. Chester Fox was a close second, and Miss Agnes Wood was third.

MANCHESTER.

THERE were thirty entries for the annual hill climbing competition of the Manchester Motor Club last Saturday, at a spot the location of which need not be given in the press. The first three competitors in each class were:—

The 60-h.p. Napier which made the fastest time at the Manchester Motor Club's Hill Climb.

Class A (for two-seated cars, chassis price not to exceed £175).—1, Mr. J. Newton's 6-h.p. Rover (driver E. Ridgway) which made the fastest time and also won on the handicap; 2, Mr. J. T. Ward's 6-h.p. Rover; 3, Mr. V. G. New's 6-h.p. Siddeley.

Class B (for cars, chassis price not exceeding £325).—Mr. R. H. Carlisle's four-cylinder Argyll (T. F. Waugh, driver); 2, Mr. R. Newton's 14-h.p. Vulcan; 3, Mr. T. Garner's 14-h.p. Singer.

Class C (for cars up to £450 chassis price).—1, Mr. Hollingdrake's Talbot; 2, Mr. R. Crossley's Belsize; 3, Mr. H. D. Ashworth's Cottereau.

Class D (for cars up to £550 chassis price).—1, Mr. W. Stone's Clement; 2, Mr. J. Arrowsmith's Horbick (driver, H. W. Cranham); 3, Mr. T. Garner's Beeston-Humber.

Class E (for cars over £550 chassis price).—1, Mr. H. Hollingdrake's four-cylinder De la Buire; 2, Mr. H. Hollingdrake's six-cylinder De la Buire (Mr. Hodgkinson, driver); 3, Mr. J. Newton's six-cylinder 60-h.p. Napier (Sidney Smith, driver). The last named car, of which we give an illustration on the hill, made the fastest time.

Mr. F. C. Hunt was the judge, Messrs. J. H. Baynes and W. T. Munroe timekeepers, and Mr. J. Lowe starter.

LINCOLNSHIRE A.C.

ON Saturday the Grimsby members of the Lincolnshire A.C. entertained the other members of the club, and there was a very large assembly of motorists from all parts of the county to accept the hospitality of the Grimsby men. The beautiful park at Grimsby was placed at the

disposal of the motorists, and a space was reserved for the cars. After light refreshments the cars were drawn up in a long line, Mr. W. T. Swaby, as the first motorist in Grimsby, taking the lead, Mr. Alec Black, as the second, following him, and having the Mayor and Mayoress, Ald. and Mrs. Jacob Pickwell, on his car. A start was made for Cleethorpes, the popular and rapidly growing seaside resort.

As the cars passed through Grimsby a very large number of people turned out to see them, the display including several excellent vehicles. The entire route was well lined. At Cleethorpes, the procession was taken to the Kingsway and there cinematographed, the films being shown at the Palace at night. At the end of the Kingsway the cars turned into the Esplanade and were driven back to the park. Here high tea was served, the excellent band of the 3rd Lincoln Volunteers playing a choice programme of music.

A most pleasant time was spent, the hosts attending to the wants of their guests in quite excellent style, and when the large party broke up it was with the feeling that it was one of the most enjoyable gatherings held by the Lincolnshire A.C.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

THE first meeting of the coming session of the Incorporated Institution of Automobile Engineers will be held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., on Wednesday, when Colonel Crompton, C.B., R.E., will give his presidential address on "The Future of Automobile Engineering."

SOUTHERN MOTOR CLUB.

THE Southern Motor Club held a hill-climbing competition on Saturday, with the following results:—Single-cylinder motor-cycles.—J. Brodie, 1; A. Ablett, 2; W. L. Lorkin, 3. Double-cylinder motor-cycles.—C. Jones, 1; G. Aldington, 2. Passenger-cycle class.—Holt, 1; Patterson, 2; Aldington, 3. Large cars.—Goddard, 1; Patterson, 2. One and two-cylinder cars.—Carpmael, 1; S. W. Philippott, 2; Mr. Wylie, 3; Mrs. Wylie, 4. Difference between fastest and slowest time.—C. Jones, 2 min. 51 sec., 1; G. Aldington, 2 min. 19 2-5 sec., 2; J. Brodie, 2 min. 11 4-5 sec., 3; W. L. Lorkin, 59 3-5 sec., 4.

WILTSHIRE.

THE inaugural meeting of the Wiltshire Automobile Club was held at Westbury, Wilts, on Saturday, when Dr. Tubb Thomas, who has been chiefly instrumental in its formation, said there were nearly eighty members.

Mr. George Palmer, Backhouse Park, was appointed president, and it was decided to affiliate to the Motor Union and the Royal Automobile Club. The meeting was followed by a motor gymkhana.

THE Bradford M.C.C. is arranging an interesting winter programme.

AT the Essex Motor Club's gymkhana at High Beach on Saturday Miss Muriel Hind on her 24-h.p. Deasy won the first event for cars.

MR. WHALEY, of the Central Motor Garage, Long Eaton, was starter and handicapper at the recent hill climb of the Long Eaton and District M.C.C. at Woodhouse Hill, near Melbourne.

ARRANGEMENTS between the Motor Club and the British Motor Boat Club have been completed at the Motor Club House, Coventry Street, London, W., and the amalgamation of the two clubs is now *un fait accompli*.

WITH reference to the open hill climb of the Auto-Cycle Club which was to have been held at Birdlip on September 9th last, but which had to be postponed, it has now been decided to hold the event on Sharpshoe Hill, a few miles north of Luton, to-day (Saturday), starting at 2 p.m. The weighing will take place at 11 a.m., the motor-bicycles being weighed at the foot of the hill, and the passenger machines at the Great Northern Railway Station, Luton.

MR. JULES FAGARD, of Liege, the manufacturer of the Sthenos carburettor, is now in this country with an entirely new model of the well-known carburettor, which has been tested with perfect success on several makes of cars.

SPEAKING of a set of 915 by 105 mm. steel-studded tyres fitted to his 70-h.p. Mercedes, Baron Friedrich von Born, of Budapest, writes to the Dunlop Company:—"The car has a weight of some 2,000 kilos, but they have run more than 5,000 kilometres. In spite of the great speed and weight of the car and the condition of the roads they have behaved splendidly, and have worn so well that I have been able to have them retreaded in Vienna."

MESSRS. R. REYNOLD JACKSON AND Co. inform us that they have contracted for the sale of no less than twenty-two Jackson cars in four days, and arrangements are being made to double the output for 1908. We learn that these vehicles can now be obtained through the Chelsea Motor Garage, 85, King's Road, Chelsea, S.W., and on easy payments through Messrs. William Whiteley, Ltd., Queen's Road, Bayswater, W. Messrs. Jackson are open to fix up agency arrangements with enterprising and reliable concerns in Scotland and Ireland.

CASES UNDER THE MOTOR CAR ACT.

HEAVY HAULS.

The Whitley Bay magistrates have had five motorists before them on one day. Fines of 20s. and costs were imposed in each case.

A large batch of summonses against motorists has been disposed of at the Kingston Bench. For driving to the danger of the public three penalties of £10 each were imposed. For exceeding the limit on the Portsmouth road six were fined £28 and costs. For exceeding the ten-mile limit in Richmond Park four motorists were fined an aggregate of £8. On Saturday seventeen motorists were fined £73.

At Cromer several motorists have been fined in one batch for exceeding the legal limit. Six motorists have been summoned for driving to the danger of the public at the St. Augustine's (Canterbury) Petty Sessions. All were fined. Three drivers have been fined at Snaith.

Four motorists were fined £2 each on one day at Kingston for exceeding the speed limit in Richmond Park.

At the Shoreham Petty Sessions, on Monday, five motorists were fined £27 and costs.

£25 FOR THREE OFFENCES.

Sydney Collings, of West Hampstead, who was fined £25 and costs or six weeks' imprisonment, at the Lewes Petty Sessions, on September

Trentham, or round the dangerous corner from Stoke. Each defendant was fined 40s. and costs.

INFRINGING COMMONS BYLAWS.

Thomas Bannister, of Barnes, was summoned for driving a motor-car over the turf on the Wimbledon and Putney Commons, contrary to the by-laws, on the 18th ult. Keeper Arthur stated that he saw defendant driving his motor-car over the turf and told him he was infringing the by-laws. Defendant replied that he was there for the purpose of testing his car. Witness asked his name and address, which were refused. He then started to drive round the triangle at the Windmill, running on to the turf at each corner. Witness called for assistance and defendant was eventually taken to the police-station. Defendant said he was only testing his car, and wanted to see if he could turn it in 25 feet. He admitted going on to the grass once. Mr. Schwann fined the defendant 40s. and 8s. 6d. costs.

WITHIN A "LIMIT" AREA.

Harry Passant, of Coventry, was summoned for exceeding the ten mile limit prescribed under an order of the Local Government Board for Clarence Street, Kingston, on September 1st. P.c. Jones said he timed the car over a measured furlong and found the speed to be 18 miles 779 yards per hour. P.c. Beck corroborated. Defendant was placed in the witness-box and said he was a chauffeur of considerable experience. There was a tram-car ahead at the time he was stopped,

The Chateau Thierry Hill Climb.—The Scene at the Finishing Point.

27th, for three different offences under the Motor Car Act, has been released from Lewes Gaol, the money in payment of the balance of the fines being forthcoming.

At Hailsham, on the 26th ult., seven motorists were fined £51 and costs. P.s. Waghorn was a witness in each case, all the defendants having been trapped on the Eastbourne road, Polegate.

EXCEEDING LEGAL LIMIT.

At Stoke Police Court it has been stated that on August 31st an electrical apparatus for gauging the speed of motor-cars was placed over a measured quarter of a mile between Trent Vale and Newcastle-under-Lyme, and a policeman with a stop-watch was stationed at either end. As a result William J. Davies, employed by Dr. Halton, of Newcastle, and Thomas Dudson, of Hanley, were each summoned for driving to the danger of the public. Davies, it was stated, covered the distance in 46.4-5sec., equal to a rate of a little over nineteen miles an hour, and Dudson's time was given as 46.1-5 sec. Although convicting both defendants the Stipendiary pointed out that the prosecution had centred everything on the pace of the cars between the given points, and nothing was stated as to their pace over the canal bridge from the direction of

and it would have been quite impossible for him to have pulled up within the few yards he did had he been driving at eighteen miles an hour. The car was pulled up within three yards. The penalty was 40s. and costs.

DISCLOSING NAME OF DRIVER.

There was a batch of motorists before the Huntingdon Divisional Bench on Saturday, the most important case being one in which the Darracq Company were summoned for refusing to give information as to the driver of a particular car. The police had timed the car and signalled to the driver to stop, but he went on. They took the number, and finding that the car belonged to the defendants, they applied to them for the name of the driver. To this the defendants replied that it was impossible for them to comply without a number of inquiries, which they had neither time nor inclination to make. The Bench fined them £20, and agreed to grant a case if asked for.

A MOTOR-CYCLIST AT BIRDLIP HILL.

Two motor-cyclists and one motor-car driver appeared before the bench last week for motoring too quickly up Birdlip Hill. Supt. Biggs (Stroud) remarked that the specific charge against the defendant

was that of having exceeded the limit of twenty miles an hour allowed for motor-cycles and cars to travel up Birdlip Hill. He believed that this was the first occasion in this county that anyone had been summoned for travelling over a measured distance at a greater speed than the Act allowed, and also that this was the first time that a trap had been set to catch motor-cyclists breaking the law. The facts were that the Auto-Cycle Club arranged for a hill-climbing competition to take place on Birdlip Hill on September 6th, but that, in consequence of the large number of complaints which the Chief Constable received from residents in the neighbourhood, Admiral Christian instructed him (Supt. Biggs) and Inspector Dennis, of Gloucester, to take proper means to prohibit the competition. In pursuance of those instructions, they went to Birdlip and measured a quarter of a mile on the hill, which at the point in question had an average gradient of about 1 in 14; it was, in fact, neither the steepest nor the flattest portion of the hill, but with a little of both. The Auto-Cycle Club met at Birdlip on September 8th, but in consequence of an intimation that the police would be there in great force on the following day to prevent the competitions, they went elsewhere to carry out their purpose. The defendant, however, appeared at Birdlip on the 9th. He (Mr. Biggs) watched him go up the hill three or four times, and, testing the pace by means of stop watches, Inspector Dennis and himself found that on one of these occasions defendant covered the quarter of a mile in 31 sec., which worked out at a pace of over twenty-nine miles an hour. A fine of 10s. and costs was imposed.

ROAD REPORTS.

DUNDEE.—The Dundee, Broughty Ferry, and District Company have had under consideration the condition of a private road through which the tramway line passes between Dundee and Broughty Ferry.

■The Earl of Craven has recently taken delivery of his fourth Daimler. This car, which is depicted above, is a 45-h.p., having a wheel base of 9 ft., and is painted dark blue with white lines.

The manager reported that the surface was being greatly damaged by motor-car traffic, and in respect that the road has to be kept in repair by the company, it was agreed that all permits for traffic should be withdrawn.

COVENTRY.—Several of the roads in the city have lately received dressings of tarmac.

WARWICKSHIRE.—New warning signs are appearing at several dangerous places in Warwickshire, notably in the village of Kineton and near Compton Verney.

WANDSWORTH.—The prolonged fine weather has enabled the Wandsworth Borough Council to continue its dust-laying experiments, and a stretch of Trinity Road has now been treated with "Ermenite," applied from one of the council's watering vans.

SUSSEX.—An important motor speed limit inquiry is pending in Sussex. The County Council for the eastern portion of the county has applied to the Local Government Board to fix the speed-limit for motors through the neighbourhood of Handcross, on the main London and Brighton road, at ten miles per hour. A public inquiry into the matter will shortly be held by a Local Government Board inspector. There is likely to be considerable opposition to the proposal.

DURING General Booth's recent motor tour the actual mileage run by the General's car was 1,728 miles. In all, nine different cars were used on the tour, and the whole of them were fitted with Moseley's detachable tyres, thirty-eight tyres being used in all. The number of miles covered by these nine cars reached a total of 19,712, and in covering this very great distance only six punctures occurred, these being of a very minor nature.

AN INTERESTING TOUR.

THE following is the story of an ambitious fortnight's motor tour as told by the winner of the August competition promoted by the Argyll Company:—In giving an account of a most pleasant holiday spent by four friends and myself on board my 10-12-h.p. Argyll car, it is not the mileage that I think calls for special comment, although this was by no means small, doing nearly 2,000 miles in fourteen days, but the consistent running day after day in a remarkably hilly country of a small-powered car very much overloaded with passengers and luggage, and over some of the vilest as well as some of the best roads possible to be found for motoring. The car was purchased in June, 1904, at the works at Bridgeton, and has done just on 30,000 miles as recorded by my Smith's speedometer. It has a large limousine body and weighs 21 cwt. stripped. To this was added 2½ cwt. of luggage and five people averaging a little over 10 stone each.

We started on Sunday, August 4th, going through Basingstoke, Winchester, Southampton, Bournemouth, Poole to Lulworth Cove and back to Poole for the night. Next day we ran through Wimborne to Salisbury and back to Southampton. Here we shipped the car to Havre, and leaving the next morning after the troublesome Custom House formalities were got through, which, by the way, were made much easier for us through the kind assistance of the Royal A.C., we sped away through St. Romains and Lilleborne to Caudebec, and from there we made a circuitous route to the South of the Seine, arriving at Rouen in the evening.

Next morning we left early and went via Louviers, Evreux, Bonnières, Nantes, Pontoise, and St. Germain, to Paris. We now spent Thursday and Friday sightseeing in the gay city, a good part of this being done on the car. On Saturday we ran to Neufchatel and Dieppe, returning next day to Paris via Longueville, Rouen, Les Andelz, and Magny. On Monday we made a circular trip via Clamont, Beauvais, Chaumont, Pontoise, to Paris. During our stay in Paris we put up at one of the finest and best managed garages it has ever been my luck to stay at, viz., the Paris Automobile, Rue D'Anjou. On Tuesday we retraced our route to Rouen and Caudebec, staying the night at the last named place, and next morning we proceeded to Trouville, Honfleur, and Havre, recrossing to Southampton on the Wednesday night. Here we lost half a day waiting for some of our luggage which was lost on the boat, but got away about 2 o'clock in the pouring rain to Bournemouth, and from there to Lulworth Cove.

Friday morning away again through Lynn Regis, Exeter and Torquay to Plymouth. On Saturday we ran to Launceston, Bideford and Barnstaple to Ilfracombe, and on the Sunday we returned by Taunton, Shepton Mallet, Frome, Marlborough and Reading to London, arriving there at about six o'clock after spending the most enjoyable fortnight I ever had. During the whole of the tour the distance covered as registered by speedometer was 1,918 miles, and not a spanner or tool of any description was used on the car with the exception of tyre levers, tyres being our only and I am sorry to say frequent cause of delay, owing to the extreme heat whilst touring in France, but fortunately we had one of those most useful accessories with us, viz., a H. F. car vulcaniser, without which I don't think any motorist ought to venture on tour. On the whole the roads might be described as good, but for the first ten or fifteen miles out of Paris in every direction we took I have never met with such villainous surface, and also the cobbles through every village in France are terrible, and it is a marvel to me how the car, loaded as it was, got through without broken springs. Then again the hills we met with after leaving Rouen and again in crossing Devonshire were frequently one in seven, and on no single occasion did we have any trouble in getting up them with full load of luggage and passengers. The petrol consumption for the whole tour worked out at 26½ miles per gallon.

MOTOR-CAR-IST v. MOTOR-CYCLIST.

BEFORE the Newport (Mon.) county magistrates Wm. Muston, of Newport, was summoned by J. J. Galloway, of Cardiff, for obstruction on the highway by taking the wrong side of the road. Prosecutor said when he told defendant he ought to keep to the right the latter replied, "I left you plenty of room to pass." Prosecutor, who was in a motor-car, said he would summon him. Defendant now said he had no intention of obstructing. He was cycling to St. Bride's to take photographs, and in passing over Ebbw Bridge turned to the right side to get water for his apparatus. He was fined 10s. and costs.

THAMES CONSERVANCY REGULATION.

AT Feltham, on Monday, John D. Campbell, of Sutton, was summoned at the instance of the Thames Conservancy for unlawfully striking a match whilst on a petrol motor launch in Molesey Lock on August 31st, contrary to the Thames Motor Launch Bye-laws, 1906. He was further summoned for navigating the launch after sunset without carrying the regulation lights.

The Chairman: But how is a man on a motor-boat to light his pipe if he is not allowed to strike a match?

Mr. Ernest Glenshaw (for the prosecution): It is only in a lock, sir, they are not allowed to strike a match.

The Bench fined the defendant 20s. for striking the match, and 10s. for having no lights.

COMPANY NEWS.

PATENT FLEXIBLE MOTOR SYNDICATE.—£5,000. To acquire from Mr. C. J. Montgomery the benefit of an existing invention relating to improvements in petrol or gas internal combustion or steam engine driving gear, &c. No initial public issue. 25, Castle Street, Liverpool.

GROSVENOR MOTOR COMPANY.—£10,000. To take over the business of a garage keeper and motor-car repairer carried on at Old Post Office Yard, Chester, by Mr. E. France-Hayhurst. No initial public issue. First directors: Messrs. W. S. McDowell, R. H. Storey, E. France-Hayhurst, and Captain J. E. Alkin.

CONNAUGHT MOTOR AND CARRIAGE COMPANY.—£12,000. No initial public issue. First directors: Messrs. P. P. Ness and S. C. Godfrey.

SABELLA MOTOR-CAR COMPANY.—£2,000. Agreements (1) with Mr. F. Sabel, (2) with Mr. F. Sabel and Mr. J. D. Pattullo, and (3) with Mr. A. T. Warne. No initial public issue. First directors: Messrs. F. Sabel and J. D. Pattullo. 5, Cowley Road, Leytonstone.

A. DARRACQ AND COMPANY (1905).—The dividend on the preferred ordinary shares has been declared for the half-year ending September 30th, 1907, at the rate of 7 per cent. per annum, and a further dividend of 3 per cent. per annum has been declared (making 10 per cent. for the year) by reason of the payment of 10 per cent. per annum on the ordinary shares having been made.

STEPNEY SPARE MOTOR WHEEL.—The directors, in submitting the balance-sheet showing the results of the company's operations for the nine months from November 23rd, 1906, to August 31st, 1907, state that under the purchase agreement the business was deemed to have been carried on for the benefit of the company for two calendar months prior to the registration. The accounts show a net profit of £20,930. The directors recommend that a dividend be paid at the rate of 20 per cent. per annum, calculated from the date of the incorporation to the end of the financial year, which will absorb the sum of £13,528, that the sum of £5,000 be carried to a reserve account, and that the balance, namely, £2,401, be carried forward. The directors see no reason why the demand for the wheels should not continue to increase. A branch company has been registered in Germany, with headquarters at Lindowerstrasse, Berlin, under the title of the Stepney Auto Reserve Rad, G.m.b.H. Stepney wheels are now being manufactured at the Berlin works as well as at Llanelly.

AUTOMOBILE ACCIDENTS.

A CORONER'S jury at Bournemouth returned a verdict of "Accidental death" in the case of Mr. George Montray Verschoyle, a Dublin resident, who was thrown out of a motor-car near the town and expired in hospital. The car belonged to Mr. J. Ewen, and the accident was caused through a tyre becoming detached, causing the motor-car to run up a bank and overturn. Mr. Ewen told the Court he arranged to put two cars on public service in the town. Witnesses for the corporation stated that the cars were examined in a general way, and not by an expert. In returning their verdict the jury recommended that all mechanically-driven vehicles plying for public hire in the borough should first be examined by a fully-qualified motor-engineer.

Mr. HANCOCK, secretary to Lord Portsmouth at Guisachan House, Inverness-shire, has almost recovered from the effects of the Affric motor accident, reported in our last issue. The chauffeur has also recovered. Many people cycled to Affric to visit the scene of the accident. The motor-car remained for some days where it fell, twenty feet below the embankment.

As a motor-car belonging to Mr. T. Shackleton, of Heaton, was being turned from Oak Lane into the Keighley road, the wheels skidded on the greasy setts, and the car swerved into the front of a tramcar. The front of the motor-car was badly damaged.

On the Ashbourne road, near Derby, a serious accident to motorists has occurred owing to the bursting of a tyre. The accident occurred at Mackworth, and resulted in the car turning a complete somersault, the rear portion of the car being hurled forward and pinning four of the unfortunate occupants underneath. The fifth, who escaped uninjured, hurried for assistance, and his companions were extracted from their terrible position with all possible speed. All were more or less injured. Soon afterwards a car belonging to Mr. H. H. Raphael, M.P., arrived on the scene, and the chauffeur placed this at the disposal of the unfortunate victims.

An inquest was held on Monday at Rushden concerning the circumstances attending the death of Mr. Frank Whitworth, who was killed in a motor accident. The evidence showed that he had travelled by motor-car on Saturday night from Wellingborough, and when entering Rushden he passed two pedestrians. In front of them were two other pedestrians, whom he apparently did not see. After passing the first couple safely he ran into the second couple, both of whom were knocked down and seriously injured. Mr. Whitworth was thrown off his machine and fractured his skull, death resulting on Sunday. A verdict of "Accidental death" was returned.

A CORONER'S jury at Chester has found that no blame was attributable to the driver or occupants of a motor-car which knocked down and killed a child named Walter Smith on Saturday night. An eye-witness stated that the child ran immediately in front of the car, which was being driven at a speed of six miles an hour.

A MOTOR accident occurred near Firsle last week. Mr. Cecil Chandless, of Sherrington Manor, was leaving home for a tour in Lincolnshire. Just after leaving Firsle he saw in front two horses being exercised by a groom—one ridden and the other led. Mr. Chandless suddenly steered into the gateway of the road leading to Glynde from Pay Gate Cottage. Being confronted with the gate he seems to have endeavoured to turn into the road again. There was insufficient room to do this, and the car crashed into the cottage, knocking the wall in, and finally coming to a standstill with half of it inside the house, on top of the debris. In fact, the car practically took off a big corner of the building.

AUTOMOBILE INSTRUCTION.

SUPPLEMENTING the information we gave in our last issue with regard to the various opportunities for instruction in motor-car work that now exist, we give the following:—

Mr. J. F. Ronca is the teacher of motor-car engineering at the G.E.R. Mechanics' Institution, at Stratford. The syllabus is of a very practical character, embracing steam and electric vehicles as well as petrol cars.

The Institute of Chauffeurs, Ltd., of 94, Victoria Street, S.W., have made a feature of automobile instruction for the last four years, during which time some 2,000 men have qualified as chauffeurs and motor-car drivers, not to mention a goodly number of lady pupils who are now in a position to take entire charge of their various cars.

The National Motor Academy, of which Mr. George Sherrin is the secretary, has a well-equipped school in the Boundary Road, Notting Hill, W.C. In addition to lectures in the schoolroom it has a private track for practical instruction in driving and a workshop for acquainting pupils with practical repair work. Day and evening classes are held, and an hour daily is devoted to practice in tyre work. The scheme of tuition includes a fortnight's course of instruction, a private tuition course, and a thorough knowledge of garage repairs.

On the occasion of the recent visit of the Provincial Grand Lodge of Freemasons to Henham Hall, Suffolk, the seat of the Earl of Stradbroke, two Churchill charr-a-banc were employed to convey the guests.

The Paddington Technical Institute is holding two classes weekly in motor-car instruction. Last year they had more than 130 students and Mr. W. Hemingway, the teacher, had a very successful course.

New classes in automobile instruction have been started at the Woolwich Polytechnic, meeting on Mondays and Thursdays. These will follow the City and Guilds of London Institute syllabus and be conducted by Mr. W. Hemingway, who is a pioneer instructor in automobilism, his teaching experience dating from 1898.

As showing the satisfaction which these cars give their owners, the Daimler Company have sent us a photograph in which is shown a fleet of a private gentleman who runs no less than five Daimlers. The first glance at the photograph would convey the idea that it was one of a club meet, but this is not so, every car having been purchased by the same gentleman.

THOSE who have once tried using a petrol strainer between the tank and the carburettor are not likely afterwards to dispense willingly with its aid; but it is not often such clear and definite proof of the utility of any fitment is available as that secured recently by the E. M. Bowden's Patents Syndicate, Ltd. One of the trade clients of that firm, a large motor dealer in the Midlands, finding that the Bowden petrol strainer fitted to a car no longer worked freely, returned the offending article to the works, where an examination showed it to be completely choked—not only the straining gauzes but the body as well—with the sediment intercepted on its way from the tank to the carburettor. The number of involuntary stops saved to the driver of the car in question by means of this useful little attachment must have been considerable.

FORTHCOMING EVENTS.

OCTOBER.

- 7th (M.).—The L.G.B. Order for the restriction of the speed of motor-cars to ten miles an hour when passing through Ilford comes into operation.
- 12th (S.).—Close of the Commercial Vehicle Trials. Final run from Baldoek to Dalston, London, N. Southend M.C. closing run of the season to Witham. Brooklands A.R.C. meeting.
- 17th (Th.).—Demonstration of Commercial Motor Vehicles in Glasgow, under the direction of the Commercial Vehicles and Industrial Committee of the Scottish A.C.
- 19th (S.).—Auto-Cycle Club's quarterly trial.

NOVEMBER.

- 13th (W.).—Annual Dinner of the Motor Union.

DECEMBER.

- 7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.

MARCH, 1908.

- 21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

PUBLIC MOTOR SERVICES.

THE F.I.A.T. Motor Cab Company, Ltd., has made satisfactory arrangements with regard to its garage, which is situated in a most central position close to Victoria Station. The first delivery of cabs is expected to be running early in December next.

Primarily formed to provide Folkestone with an up-to-date motor service, the South Eastern Motor Supply Company will also establish a garage in that town and undertake a general motor trade. The directors are Messrs. J. W. H. Dew, R. S. Currie, C. A. Lloyd, and F. W. Ediss. The capital is £10,000 and the registered office is at King's House, King Street, E.C.

AERONAUTICS.

MR. JOHN DUNVILLE and Mr. C. F. Pollock ascended from Chelsea in the former's balloon La Mascotte at one a.m. on Saturday, and having passed to the north of Oxford, over Upton-on-Severn, the Malvern Hills, Hereford, and the wildest parts of the Welsh mountains, descended near Lampeter, Cardiganshire, at 8.20 a.m., having travelled about 190 miles in 7½ hours.

THE balloon Satellite, with Mr. Philip Gardner and Mr. Short on board, which ascended from Battersea on Thursday night last week at 10.15, descended three miles from Ellesmere, at a place called Knolton Bryn, Flintshire, at 5.30 a.m. on the Friday morning, the distance covered being about 200 miles.

A DISMISSAL.

AT the Tonbridge Petty Sessions, David Broomhold has been summoned for driving a motor-van at a speed which was dangerous to the public. After the police evidence the defendant said he had for nearly two years driven motor-buses in London, and had for four years driven motor-cars. On the day in question he was drawing 5 tons 10 cwt. and his motor-van was geared up to twelve miles an hour. He went into the town at about five or six miles an hour, and he slowed down to four miles. When he got to some sheep he had to slow down to two miles an hour to get by. He passed four constables and one sergeant in the High Street, and not one of them spoke to him. Mr. Gregory, in addressing the Bench, remarked on the unfairness on the part of the police in not stopping the car and giving the defendant an opportunity of protecting himself. The Bench dismissed the case.

POLICE TRAPS.

NEAR the Mile House, on the Chichester road, at Arundel, is a measured distance.

THERE are several traps on Bury Hill and on the Worthing road, in Ferring parish, near Arundel.

THERE is a police trap within the ten-mile limit at West Kilbride, (Ayrshire).

A POLICE trap of 440 yards at Thornholm village, on the Bridlington and Driffield road, has been discovered to be 455 yards long. That is in Yorkshire—not Sussex.

THERE is a police trap just outside Colchester, on the main road to Clacton.

AMONG the Kentish villages in which police traps have been laid are Chislet and Sturry.

AT Ratley and at Pillerton Priors are traps leading to the Kington Petty Sessions.

THE High Road, Hayes (Middlesex) has its motor trap.

BETWEEN the police station and the National Schools at Llandrindod Wells is a measured stretch of road 330 yards long.

MESSRS. MILLION-GUIET, a well-known Parisian firm of motor body builders, have opened an English depot at 48, Old Bond Street, London, W.

AUTO-CYCLE CLUB.

IN order to meet the wishes of some of the clubs eligible to compete in the final of the Penalty Run of the A.C.C., which was to have taken place on the 28th ult., the Auto-Cycle Club has postponed this event until Saturday, October 12th. The competition will be run off over a course in the neighbourhood of Derby. The length of the route selected is about thirty-eight miles, and this will be traversed three times.

BUSINESS NEWS.

PRICE'S PATENT CANDLE COMPANY, LTD., forward from their Belmont Works at Battersea, S.W., interesting souvenirs in commemoration of the Tourist Trophy events of 1905, 1906 and 1907. In addition to providing interesting photographs of the winners as well as the result of the Tourist Trophy races, the souvenirs also draw attention to the part played by Price's Motorine in connection with these events.

ADMIRAL FOLEY, who has just been appointed to take charge of the Home Fleet, has purchased a 15-h.p. Humber car from the Motor Supply Company, Ltd., of 111, Piccadilly, London, W., which he intends using in connection with his official duties.

DURING the past year the Hele-Shaw clutch has rapidly increased in popularity with the British and French trade, and its use is now spreading to the other side of the Atlantic. To develop this branch of the business, arrangements have been concluded whereby the sole American rights are vested in Mr. Powell Evans, of the Merchant and Evans Company, Philadelphia. The manufacture of all types of clutches has already commenced, and from present indications it appears that the Hele-Shaw clutch will have a good vogue on American cars for the 1908 season.

THE COVENTRY CHAIN COMPANY, LTD., write us as follows:—"You will be glad to hear that, owing to the notice you were good enough to put in your paper concerning the cigarette case we were giving away, we have had applications for between 4,000 and 5,000, and we should be glad if you would apologize for us for the delay which is bound to occur in despatching the cases to some of the applicants. We have plenty more for distribution, but must ask that future requests be accompanied by 2d. in stamps for postage."

MITCHELL'S GARAGE, in Wardour Street, London, W., has been quite a rendezvous for American tourists during the season now closing. Calling there the other day we noticed at least half a dozen American cars in addition to a large number of British and Continental vehicles.

IT is interesting to note the advantage which is being taken by members of the medical profession, who now fully realise the usefulness of the motor-car, of the present flooding of the second-hand car market and the consequent low prices obtaining—so writes Mr. H. Waymouth France, A.I.E.E., consulting automobile engineer, of 39, Westbourne Gardens, W., who makes a speciality of carrying out expert examinations of second-hand cars.

FOR 1908 season three sizes of Weigel cars are to be made, viz., 25-h.p., and 40-h.p. four-cylinder and 60-h.p. six-cylinder. The 25-h.p. and 40-h.p. models will each be made in two lengths of chassis.

MR. WALTER WELLMAN, of the Wellman Chicago Record-Herald Polar Expedition, just before he started on his voyage towards the North Pole, wrote to the De Dietrich Company, Ltd., expressing his great satisfaction with the 70-80-h.p. Lorraine-Dietrich motor supplied for the polar airship "America." He reports:—"We find the motor economical in its consumption of petrol, and it would be difficult to design or to desire a better motor for the propulsion of a great airship, in which safety, endurance and economy are greater desiderata than lightness of weight."

To ensure more harmonious action on the part of drivers after having passed the winning post at the completion of races the Brooklands authorities have issued special instructions, and cancelling those formerly issued, which requested drivers to pull up as soon as possible after crossing the finishing line and to remain standing until all cars had completed the race. Under this new scheme there will always be a width of 50 feet available on the track should a car come along the banking under the members' bridge passing towards the railway side of the track at full speed. Certain hours will be reserved on each of the practising days which precede a race meeting for the purpose of affording competitors an opportunity to familiarise themselves with the new limit line.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, OCTOBER 12, 1907.

[No. 449.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

“THE INDUSTRIAL MOTOR REVIEW.”

“THE INDUSTRIAL MOTOR REVIEW,” which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

“The Industrial Motor Review” is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

THAT the motor-car is effecting considerable alteration in the social life of the nation is a truism. The late Sir Francis Jeune was one of the first of the public men in the early days of the Motor Movement to draw attention to the enlargement of the radius of social pleasure that was being made by the automobile. Now every country

house is possessed of its automobile—not, perhaps, the latest model of the car, but some reliable vehicle that can make its two or three journeys to and from the station for the conveyance of guests, while the “old grey mare” is plodding along with a single consignment of luggage. The mansions of greater extent are now having added to their outbuildings substantial garages for the accommodation not only of the owner's, but also for the visitors' cars—a development of countryside architecture which was probably pioneered by the Hon. Evelyn Ellis in the first completely-equipped building of the kind that he erected at his place near Windsor. The importance of design in a garage will be recognised by motorists even more than by architects and builders themselves. Many details have to be considered, and the exact location in relation to the exits and entrances from the estates is not the least essential factor in the whole scheme. In this connection we may mention that the additions made to the Royal stud of automobiles, and the popularity of the car among those who visit the King at Windsor, has made the provision of an extensive garage there an urgent matter. As a first practical step, the Crown has purchased a number of properties in Park Street, Windsor, leading to the Long Walk and adjacent to the Castle precincts. The tenants have been given six months' notice to quit, when the houses will be demolished, and others, as they are acquired, to make room for a number of improvements about the Castle, one of the most important being the provision of a Royal garage for motor-cars.

A Case for Appeal.

THE nervousness of a couple of women was apparently the cause of a motorist, Mr. R. F. Williams, being brought before the Westminster magistrate last week charged with reckless and negligent driving of a motor-car. Mr. Williams was driving in the Brompton Road when the ladies in question left the side walk for the road, necessitating the brakes being put on suddenly in order to avoid a collision. Of course, a crowd assembled when the car skidded and the French mechanic, in his excitement, jumped out. The policeman, who could not have seen the original occurrence, then said he should charge the motorist with drunkenness and with driving to the common danger. Mr. Williams was taken to the police station, detained in the cells for several hours, and ultimately let out on bail. On the case being tried the charge of drunkenness was dismissed, the only evidence that was heard on his behalf being his doctor, although he had seven other witnesses, five of whom he had never seen before, to testify to his sobriety at the time. The charge of reckless driving was then proceeded with. A hairdresser's boy estimated the speed at thirty miles per hour, and a fine of £20 and £10 costs was imposed. The case is certainly one that should be carefully considered by those who act for the protection of motorists, with a view to an appeal.

A Good Word for Drivers.

MUCH of the success that has attended the development of the industrial motor vehicle must be attributed to the drivers, who have been responsible for the manipulation of the automobiles through the streets as well as their care in the garage. Firms employing motor-vans in their business have generally been able to attract a good class of steady men, who have continually endeavoured to improve their knowledge of their vehicles, so as to be able to deal with any emergencies that have arisen. We are glad to know that there is also full co-operation in this matter between the Army authorities and many commercial leaders who are associated with the motor movement. The scheme recently instituted by the War Office for training time expired soldiers in the driving of motor vehicles is now in full swing, and there are busy times in store at the Clarence Barracks, Portsmouth, which are the headquarters of the motor training section. Recently a second-hand 12-16-h.p. M.M.C. car was purchased, and this is now being examined by a class of twenty-five men. Local motorists are also invited to extend the men's knowledge by occasional demonstrations with their cars of other types. At the end of the training the pupils undergo an examination for regimental certificates as to their ability as drivers, and all also enter for the Royal Automobile Club driving certificate examination.

A Society of Pilots.

OR the making of societies there is apparently no end, and it has remained for Mr. Bryan Scurfield, of Manchester, to inaugurate one which certainly has novel features, although the necessity for its organisation may be doubted in many quarters. He notes that no vessel is allowed to cross the bar of the Mersey without a pilot in charge, and having seen that small children and others are often in “abject terror” when crossing the road, he seeks to adopt the idea of the Mersey pilot, and

form a society of pilots to help people to cross the busy streets. The "Society of Pilots" would be for men and women. There would be no subscription and only one rule, viz., to assist children and infirm persons in the streets to cross. This he regards as more useful in the present development than the mere abuse of motor-cars, and hopes in a few weeks to be able to report considerable progress in the idea thus indicated.

Exaggerated Reports.

EVIDENCE at two or three recent inquests on the victims of accidents in which motor-cars were alleged to be concerned, proves that the old habit of the general Press in carelessly ascribing most of the unfortunate mishaps on the highways to the presence of automobiles has not been entirely departed from. Occasionally the spirit of fairness prevails, as was shown by a Manchester journal which recently published an account of a motor-car mishap, which was modified the next day into a statement that "a wheel of the motor-car stuck for a few minutes in a hole in the road; neither the vehicle nor its occupants were injured." We had hoped that the state of mind indicated by such reports was no longer in the public Press. The practice of exaggeration may be easy to follow, but it is often harmful in its results.

Mr. and Mrs. Percy Woodland on the 45-h.p. Mors car they have recently acquired.

Liquid Fuels.

ON Monday, Mr. R. W. A. Brewer gave a paper on Liquid Fuels for Motor-Cars, before the Society of Engineers, in which he pointed out the advantages of the adoption of large "heavy oil" engines for marine purposes, as compared with gas-producing plant and gas engines. A synopsis was given of what has been accomplished by makers of heavy-oil engines and paraffin engines, and the two methods of carburating air by means of paraffin were discussed, necessity being urged for an accurately-measured feed of oil for each working stroke, as distinct from the utilisation of a spray carburettor. He showed that the specific gravity of petrol has increased during recent years, and said that carburettors should be modified to satisfactorily utilise petrols of even a greater density than those now on the market. The advantage of the adoption of a spirit of a greater specific gravity than 0.720 was clearly demonstrated. Tables were given showing the results of the author's experiments upon the rate of evaporation of various petrols and the effect of heat and air currents. These proved that higher temperatures materially affect the rate of evaporation of petrols of greater density, whilst the effect of air currents is less marked. Results of road tests upon carburettor loss and strength of explosive mixture were

compared with those put forward theoretically and as the result of laboratory experiments. The necessity for some alternative fuel was admitted, and Mr. Brewer showed that the results of the benzol tests are very satisfactory, the distance covered by the car per gallon of fuel being a marked increase as compared with various brands of petrol. Alcohol was tested when mixed with a proportion of another liquid fuel and without any alteration to the engine. The results obtained show great promise for this fuel, and enabled the author to refute statements which have been made with regard to alcohol being an impossible fuel for a motor-car engine.

The Use of the Camera.

MANY motorists are photographers; in fact, the car has done much for the camera—or rather the makers of the same. But not often has the camera proved so useful to the car as in the case at the Holt (Norfolk) Petty Sessions, when Mr. F. R. Horne, of Reigate, was summoned for driving through a "measured distance" at Bodham at a pace exceeding the legal limit. The defendant said the trap was thirteen yards beyond the quarter of a mile alleged by the police, and Mr. T. B. Wood, Professor of Agriculture at Cambridge, said he took a photograph, which was produced. The camera was placed on the gate where the sergeant stood. The witness said it was impossible to see the end of the trap from where the sergeant stood, and the Bench retired to consider. Upon their return the chairman said the Bench had decided to dismiss the case.

Motor-car Imports and Exports.

A VERY appreciable decline took place last month in the importation of foreign motor-cars and parts into this country. The number of complete vehicles which reached the United Kingdom during September was 286, their value being given at £143,835. Parts were responsible for an additional £133,556, which gives a total of only £277,391, as against £314,625 in the corresponding month of last year. For the first nine months of the current year the figures are:—Number of cars imported, 3,838; value of same, £1,675,224; imports of motor parts, £1,935,602; total, £3,610,826. For the similar period of 1906 they were:—4,821 cars of a value of £2,009,533; parts, £1,430,097; total, £3,439,630. Turning to the exports of British motor-cars and parts, these continue to show a steady expansion, September's total of £136,478 forming a new record. The number of vehicles shipped during the nine months ending with September last was 1,578, of a value of £575,509; to this have to be added parts estimated at £360,245, which gives a combined total of £935,754, as contrasted with only £510,266 in the corresponding period of 1906.

Horses on the Highway.

HORSES straying on the highway are a source of danger to motorists—perhaps more so to them than to any other users of the highway. An instance has occurred at Rushton, when a motor-car, owned and driven by Mr. T. F. Spencer, a veterinary surgeon of Kettering, and having as a passenger Superintendent Hooper, the chief of the Kettering Divisional Police, crashed into a drove of horses while descending the steep hill leading from Desborough to Rushton, flanked on the west side by the wall surrounding Rushton Park, and on the other by a high-banked hedge, whilst the overhanging trees almost completely shut out the wan light given by the rising moon. Half-way down the hill is a gateway leading to the farm premises belonging to Rushton Hall, and it is supposed that the horses must have either inadvertently strayed from those premises or from a field on the opposite side of the road. At all events, the car was running down the hill at a fair speed, when the form of a horse suddenly loomed in front of the vehicle. The narrowness of the road made it impossible for a collision to be avoided, and the front of the car struck the animal with great force, bowling

it over and over along the road. Unfortunately the car swung round, and, colliding with the Park wall, turned topsy-turvy. The occupants were fortunately thrown clear of the car, but not without injury.

The Military Airship.

ON Saturday we were interested in the spectacle of "Nulli Secundus" passing in front of the office of the M.C.J., after paying respects to the War Office, and on its way round St. Paul's. The Royal Engineers are to be congratulated on the success of their enterprise, and Colonel Capper's initial voyage from Aldershot marks a new era in aerial navigation that should cause a renewal of interest in the subject. While the airship remained at the Crystal Palace it was visited by Colonel Templar, Professor Huntington, the Hon. Mrs. Assheton Harbord, Mr. Harold Perrin, and other well-known aeronautical experts. About noon on Monday preliminary preparations were made for the ascent. The propeller blades, which had been removed over-night, were re-attached, and the engine was set in motion. The

number of individual vehicles dealt with. At the same time the comparative solitude of some of the City streets compared with a few months ago is proof of the serious character of the police attack on noisy buses. But the emptiness of many of the vehicles along main routes suggests a continuance of the present unsatisfactory financial position.

The Commercial Vehicle Trials.

AFTER their long pilgrimage, those engaged in the R.A.C.'s Commercial Vehicle Trials return to-day (Saturday), and will, doubtless, be welcomed by an interested crowd at the motor-bus garage, Shrubland Road, Dalston. According to the provisional record, the cars which had made non-stops since the beginning of the trial on September 9th up to Saturday last were:—A6, Unic Van; B12, Lacre Box Van; C13, Halley Van; C19, Thornycroft Lorry; E30, Hallford Lorry; E32, Siddeley Canvas Tilt Wagon; E33, Straker-Squire Open Van; E43, Commercial Cars Lorry; E45, Thornycroft Lorry; F52, St. Pancras Lorry; F53, Yorkshire Steam Lorry, and H59, Wellington Steam Tractor. On Monday the vehicles

The British Military Airship "Nulli Secundus" rounding St. Paul's Cathedral in the course of its flight from Aldershot to London on Saturday last.

propellers, acting as fans, had the effect of drying the structure, which continued rapidly to lose the moisture that accumulated. Colonel Templar was, however, of opinion that it would hardly be possible for the ascent to take place owing to the heavy state of the atmosphere, and after efforts extending over two hours, the attempts to resume the journey were abandoned for the day.

Motor-Buses in the Metropolis.

THE Commissioner of Police for the Metropolis has lately addressed a letter to the Borough Councils with regard to the alleged nuisance from motor traffic in the streets. He emphasises the views expressed in our recent issues, and says that it would be "unreasonable to hold out any hope of anything he could do in doing away with noise. He could only keep on applying pressure, but he thought that they must trust more to the evolution of the machine than to police measures." Apparently some confusion has arisen with regard to the 6,211 omnibuses which had been "put off the streets," this being really a record of the number of complaints which the police had brought against vehicles, and as such notices were served on some motor-buses on several occasions, it clearly does not represent the total

proceeded from Nottingham to Leicester; on Tuesday to Northampton; on Wednesday to Bedford, where they were on exhibition during Thursday; on Friday to Baldock, and to-day they will come to London.

In Wild Donegal.

THE many motor visitors who have during the past season tasked the hotel accommodation in the Donegal Highlands have apparently convinced some of the local people of the necessity of setting their roads in order without delay. They are realising that those who go by motor-car are not the least valuable of the clients at hotels, and a list of motorists who have lately visited Donegal includes a Japanese Viscount, a German Baron, the Governor of Kassala, several members of Parliament and American tourists. Unfortunately, however, they could not speak with universal favour of the roads over which they travelled. A motoring party from Kent recently declared that six weeks on the Donegal roads had been more destructive on the tyres than a year's run in England. Points like these we are glad to notice are being taken up by the Irish Press, and if they will emphasise the lessons to be learned some mitigation of the present unsatisfactory position may be secured.

A LITTLE TRIP IN ESSEX.

I THINK it is Raleigh who says:—

Abused mortals, did you know
Where joy, heart's ease and comforts grow,
You'd scorn proud towers,
And seek them in these bowers,
Where wind sometimes our woods perhaps may shake,
But blustering care could never tempest make.

And such an old-world country lies, now that the motor-car has come, at our very door, and, what is more, we have often probably passed it by, in seeking more distant scenes and thinking merely of distance overcome and police traps evaded. Chance, or rather a troublesome friction-driven water pump, necessitated a halt on the main Colchester road not far from Chelmsford, and as, when a new fibre had been fitted and trued up in the lathe, it was too late for the journey I had had in view, and mine host had told me of lovely country bye roads, I wandered where Oliver Goldsmith once lived, through Springfield, claimed to be the original of that author's famous Deserted Village. Here I branched off past the inn to the right and so by Cuton Hall, turning off to the left on reaching the Great Baddow road, and so gently ascending amid beautiful surrounding scenery to the site of the old Danish Camp, Danbury. At

Mr. H. Hollingdrake's 15-h.p. Talbot Car which proved the winner of the under £450 Class in the Manchester Motor Club's recent hill climb.

the top of the hill is an ancient church, with a lofty wooden tower, from whence the ships can be seen passing in the Thames and Crouch, in the south the Kentish hills, on the north the fine cathedral of Essex—as the inhabitants like to call the old Thaxted Church—and on the west the Palace of the Bishop of St. Albans. The inn here, "The Griffin," is mentioned by Sir Walter Scott in the preface to "Waverley."

The Little Baddow road, which turns off to the left, can now be followed; for about a mile and a-half it is well wooded, beech, and a tree often taken for it—the hornbeam—being numerous. A turn to the left leads to the Chelmer, where good pike fishing can be had. Boreham House and Hall merit a visit. In the Great Hall—now a chapel—are the initials of Henry VIII. and Anne Boleyn, sculptured with love-knots. The road now crosses the main Colchester route, and should be followed to Brent Hall, and from there to Little Waltham across the Roman road to Great Waltham. The Norman church in this old village, which is one of the largest in Essex, contains many interesting frescoes and brasses, and in the vicinity are many fine old mansions. If time permits, a turning on the left at How Street can be followed to Pleshey, the old

town of the Tumuli, once the seat of the High Constables of England. Old Roman entrenchments surround the place, and a mound marks the site where in ancient times a castle stood. To the right, near the Mount, leads by Ringtail Green and Hartford End to Felstead, a pleasant village overlooking the Chelmer Valley. An old house has some quaint wood carvings, one setting forth the name of the builder and date—1594. There is good accommodation in the town; but, as Little Dunmow was near, and I was keen on seeing the scene where the flitch of bacon is presented, the journey was continued there. A most comfortable inn was found, and I soon heard all about the town which Ainsworth's novel has rendered famous. In the time of Henry III. a Robert Fitzwalter started the presentation of a flitch of bacon to such married couple who had not repented them, sleeping or waking, of their marriage after the lapse of a year and a day. Kneeling on sharp stones, the applicants had to swear before the prior and convent this oath:—

You shall swear by the custom of our confession,
That you never made any nuptial transgression
Since you were married man and wife,
By household brawls or contentious strife;
Or otherwise at bed or at board
Offended each other in deed or in word;
Or since the parish clerk said Amen
Wished yourselves unmarried again,
Or in a twelvemonth and a day
Repented not in thought any way,
But continued true and in desire
As when you joined hands in holy quire.
If to these conditions without all fear
Of your own accord you will freely swear,
A gammon of bacon you shall receive,
And bear it hence with love and good leave;
For this is our custom at Dunmow well known.
Though the sport is ours, the bacon's your own.

The winning pair were then installed in an armchair, which can still be seen in the church near the east end, and then the day was given over to general festivity. The church is a very interesting one and contains an alabaster monument to Walter and Matilda Fitzwalter, the latter's head being supported by a pillow held by angels. Some remains of the old Priory can be seen, and in the neighbourhood some interesting Roman pottery has been discovered.

A return to town can be made through Hatfield forest and Bishops Stortford, the birthplace of Cecil Rhodes, or a further route may be taken through Easton, the seat of the Countess of Warwick, a glorious mansion, and so on to the Sheffield of Queen Mary's time—Thaxted—a charming quaint old town with timbered plastered houses, situated on rising ground and commanding a fine view of the valley of the Chelmer. The inhabitants are justly proud of their church to St. John the Baptist. There is a splendid tower and spire dating from 1424, and the richly-carved ceiling and ancient pulpit are specially worthy of note. A pretty undulating road leads to Debden, and, though Essex does not boast of many floral rarities, the small fruited goose grass is not to be found elsewhere, and can be seen here as well as the sickle-leaved hare's ear, and, of course, the saffron, said to have been, according to tradition, introduced hidden in a palmer's staff. Those in search of quaint old cottages should turn off at Smith's Green, and take the road through Rook End to Newport. Here Nell Gwynne is said to have lived; the house is known as the "Crown," and can easily be found. We have now come to the main Cambridge road, and a turning just beyond the Park at Shortgrove goes to Saffron Walden, of murder fame. It is on the bank of the Slade, a tributary of the Cam. Edward the Sixth's Almshouses and the museum on Castle Hill are worth seeing, as well as Lord Braybrooke's mansion, a mile to the west of the town. C. T. W. H.

SEVERAL of the local authorities in the villages of Perthshire have lately requested the chief constable of the county to consider the question of the speed of motor-cars on the main roads, and the Blairgowrie District Committee has further suggested that the police should be provided with stop watches, as is the case in many localities on this side of the Tweed.

THE NAPIER 30-h.p. CAR.

NOW that the 1907 season is practically closed announcements are rapidly being made as to the new models which the various manufacturers are putting in hand for next year. One of the first programmes to reach us is that of Messrs. S. F. Edge, Ltd., from whom we learn that the 1908 models of Napier cars will number no less than seven, as follows:—18-h.p. four-cylinder, chain drive; 45-h.p. four-cylinder,

Fig. 1.—View of carburettor side of Napier 30-h.p. six-cylinder car.

chain drive; 30-h.p. six-cylinder, chainless drive; 40-h.p. six-cylinder, chain drive; 40-h.p. six-cylinder, chainless drive; 60-h.p. six-cylinder, chainless drive; 80-h.p. six-cylinder, chainless drive. Chief interest undoubtedly centres in the new 30-h.p. car which is being put on the market at such a relatively low price as to bring six-cylinder vehicles within the reach of a larger clientele than hitherto. At the same time an examination of the chassis reveals the fact that it comprises all the special features of the Napier vehicles and that the workmanship is of the usual high order associated with the makers' name.

The frame, which is supported on five springs, is well strengthened by cross members, the pair of the latter to the rear of the gear-box being additionally supported by diagonal rod braces. Fig. 1 gives a view of the motor taken from the right side of the chassis. As will be seen, the cylinders are cast in pairs, the valves being all located on the left and operated off a single cam shaft. Ample water jackets are provided, a feature being the provision of an additional circulating pipe from the valve surrounds or jackets to the radiator. The latter is furnished with a large top extension to enable a relatively large supply of water to be carried.

The mixture is furnished by a simplified form of semi-automatic carburettor, in which the centrifugal governor, hydraulic regulator, and their connections have been eliminated; it is claimed to furnish a perfect mixture at all speeds from 80 to 2,400 revolutions per minute, and is placed on the right side of the motor, the inlet pipe passing between the rear pairs of cylinders. Two air-valves are provided, one acting automatically in accordance with the suction of the engine, and the other operated by means of a lever on the dashboard. Special reference may be made to the novel arrangement of throttle control, which is so contrived that it is impossible to "race" the engine except by using the accelerator pedal. The hand lever on the steering wheel is connected to the throttle in such a way that, beyond a certain engine speed, any further movement given to it has no effect; this speed is determined by the throttle opening that will just pass a sufficiency of gas for easy starting, but no more. By this means it is impossible for a careless chauffeur to run the motor at an excessive speed, with the usual noisy roar, on starting up, and the customary rash to the steering wheel to close the throttle is

obviated. A small lever connected with a Bowden wire mechanism is provided in front of the radiator to enable the carburettor to be flooded when starting up the engine. The petrol is pressure fed to the carburettor, an adjustable valve being available for regulating the admission of the exhaust pressure to the petrol tank, and a filter is also provided to prevent any foreign matter passing. A petrol filter is similarly fitted in conjunction with the carburettor.

The ignition is of the Napier standard type of coil and accumulator with synchronised high-tension distributor. The latter is located on the dashboard, and is operated off the cam shaft through a vertical spindle fitted with a universal joint. The high-tension ignition wires are neatly enclosed in an aluminium tube which extends across the top of the engine. The advance and retard is controlled by a lever on the steering wheel, on which latter is also mounted an ignition cut out. The lubrication of the engine is effected by a small pump working in a well at the lowest part of the base chamber. The exhaust from each pair of cylinders passes by a separate pipe to an expansion chamber, whence they pass to the silencer proper.

Coming now to the transmission, a clutch of the multiple disc type is employed, a joint being introduced in the shaft between it and the gear-box to enable either part to be dismounted without it being necessary to disturb the other. A small clutch brake is also provided to facilitate gear changing. Considerable improvement has been effected in the gear-box, which is adapted to give three speeds forward and a reverse. On the top speed a direct drive is obtained, all the pinions being then entirely out of mesh. As will be seen from Fig. 2, the main shaft, with the direct drive shaft, is supported by no less than four ball bearings, the external bearings being fitted with stuffing-boxes to prevent any possibility of leakage of oil. The lay shaft is carried on three bearings; any whip of the shafts is thus prevented, while, owing to the very wide but fine teeth of the pinions, noise is reduced to a minimum when on the second or low speed. The gear is controlled by a lever working in a gate. Attached to the sector is a small lever by means of which the sprag at the rear of the gear-box is brought into action. The final drive is by a cardan shaft (provided with joints at each end) and bevel gear to a well-

Fig. 2.—The Change Speed Gear.

supported live axle, the torque of the latter being taken by a triangular rod which extends from the differential casing to one of the cross members of the frame.

Ample braking power is provided. A pedal actuates a wide external brake at the rear of the gear-box; the hand-operated brakes are of the internal-expanding type, and are provided with an effective compensating device. The dashboard fittings are of the simplest, while the dashboard, instead of being of aluminium as usual in the more expensive Napier cars, is made of 9-ply wood (thicknesses or sheets of wood closely pressed together), which is proof against cracking and warping.

CONTINENTAL NOTES.

Belgian Motor-car Imports and Exports.

To the end of August last the imports of foreign motor-cars and parts into Belgium had this year attained a value of £120,286, as contrasted with only £103,873 in the first eight months of 1906. During the same period the exports of motor-cars and parts from Belgium increased from £258,957 to £291,143.

A Competition for Drivers.

As has already been mentioned in the *M.C.J.*, the "Auto" of Paris is organising a competition to test the knowledge of motor-car drivers in case of breakdowns on the road. The "Concours de Pannes," as the event will be known, has been fixed for November 3rd. A number of cars are to be purposely

hill-climbing competition and race. The usual categories for both touring and racing vehicles will be provided, and the first part of the programme will consist of a series of runs over a level kilometre with a flying start over a distance of three-eighths of a mile down-hill, the competitors being sent off one at a time. The fastest two in each class will afterwards be sent together over the same course, but in the opposite direction, the times for the standing mile and for the flying kilometre being both taken.

The Gaillon Hill Climb.

The annual hill-climbing competition at Gaillon organised by the "Auto" is this year to be held on the 20th inst. The event is to be held on the Sainte Barbe hill, the times being taken for the flying kilometre. Classes are being provided for both touring and racing machines, several categories being provided in each section.

SNAPSHOTS OF THE SEMMERING HILL CLIMB ORGANISED BY THE AUSTRIAN AUTOMOBILE CLUB.

1.—Hemery on Benz Car. 2.—Deplus on a Pipe. 3.—Klug on a Sizaire-Naudin.

(Allgemeine Automobil Zeitung.)

placed *en panne* from the same derangement, repairable by means of the tools and spares on the vehicle. The competitors, who will be unaware of the cause of the stoppage, will then each be allotted one car, and the one who gets his machine going first will be adjudged the winner, a maximum of twenty-five minutes being allowed. To further test the capabilities of the drivers, those who fulfil the above task within the time will be required to detach and refit the tyre of one of the rear wheels of the car. The two events will be separately timed, but in the event of a dead heat in either the award will go to the one whose aggregate is the lowest.

Speed Trials at Evreux.

A somewhat novel meeting is being organised by "Les Sports," of Paris, for the 27th inst. The event, which is to be held near Evreux, will consist of a combination of speed trials,

A Trial of Two Cycle Engines.

A trial of two cycle patrol engines suitable for use on motor vehicles commenced on Wednesday at the laboratory of the French Automobile Club at Levallois-Perret. Seven motors have been entered, viz., two Tony Huber-Peugeot, a Billard, a Chastanet, a S.V.U., a Legros, and a Picot.

Miscellaneous Items.

An automobile club has just been formed at Freiburg-im-Breisgau, Germany.—The fifth annual motor-car exhibition in Turin is to be held from January 18th to February 2nd next.—The Touring Club of Italy proposes to organise a trial of motor-buses at Plaisance.—The trial of industrial motor vehicles organised by the German Imperial Automobile Club commenced in Berlin on Monday. Fifty-two entries were received, and of these forty-nine started.

FRENCH PREPARATIONS FOR THE 1908 SEASON.

(FROM OUR OWN CORRESPONDENT.)

THE French *Salon*, as it is popularly termed, will open its doors early this year—the 12th November, as at present fixed. It will remain open until the 1st December, and it is expected, as the tenth annual show of a mighty industry, to surpass all other efforts from a spectacular and commercial aspect. The coming of the show brings up the annual question regarding the novelties which will be on view. Year by year these novelties have decreased in relative importance and numerical strength, as the excellent productions from the best French firms neared perfection, as at present conceived, of the motor-car and its allied industries. A year or two ago it was recognised that no very great changes could now be sprung upon an amazed world on the opening of any particular show, but nevertheless the details offered to examination do not present

trade, and, secondly, to defeat the weapon of cheapness which it is expected will be used by the Italians in the coming season. The French certainly are awake to the fact that competition is to be feared in both these quarters.

A novelty which should be looked for at the Paris Show is that relating to a perfected carburettor for heavy oils, and also for the use of denatured alcohol. In view of the increase of price of *essence*, and the probable rarity of this fuel in the near future, French makers have been studying the application of heavy oils and alcohol in larger numbers. Further, it will certainly be found that increased and detailed attention has been given to the matter of engines for motor-boats. The perfected car has left the boat far in the rear, and the marine engine has been receiving increased attention by some firms of repute, in order to bring the motor-boat into line with its dry land confrère, and make the motors worthy of the hull.

There will not be a few firms who will confine their 1908 output of automobiles to two or three different models, and the announcement will probably be made before the show

The Church Congress at Yarmouth.—A Group of the Members' Cars outside St. Nicholas Church.

less relative interest to the client who warms up to the tiring trudge through avenues of motor-cars as his knowledge of automobile mechanism becomes more pronounced.

French makers are usually and comprehensively reticent regarding the good things in store at each successive *Salon*, but were any great change anticipated it is probable that the usual muteness would be somewhat relaxed in ratio to the importance of the novelties embodied by any particular maker.

It is known that at this year's *Salon* there will be held a competition of automatic starting arrangements. This was a novelty at the 1906 *Salon*, but little practical application of the proposals then put forward appear to have been made. This year, however, in response to a well-expressed desire on the part of several French and foreign makers, the matter of automatic starting arrangements will take the form of an open competition among the exhibitors.

As regards the cars themselves a further effort will be made to simplify existing models with a two-fold object in view. First to fight the anticipated extension of the American export

that certain firms have determined to take the bull by the horns and establish the nucleus of a factory in other countries for the manufacture of cars according to their design, the exportation of parts being, of course, a part and parcel of the policy of these attempts to obtain new business. French firms recognise that they must do this for their self-protection, and the example already set by some well-known French firms will certainly be followed by others in Italy, United States and Great Britain before very long. At present there is a stock of cars in France which will meet the demand for many months, unless the coming show brings with it a return to the brisk days of a year ago.

THE Earl of Malmesbury has recently purchased from the Daimler Company a chassis with a wheel base of 10½ ft.

THE chairman of the Carlisle Bench, in recently fining a motorist £10 and costs, said that in similar cases in future they will add to the monetary penalty the further disability of the suspension of the licences of motorists thus convicted.

CHARGING ACCUMULATORS FROM ELECTRIC LIGHT CIRCUITS.

IN our correspondence columns this week one of our readers raises a query as to the method to be adopted to charge his accumulators from the 200-volt continuous current electric light circuit in his house. As the question is one that may be of interest to a large number of motorists, we have gone into the matter somewhat more fully than usual, and have prepared a diagram, reproduced herewith, showing the necessary connections.

To charge accumulators from a house supply, it does not signify whether one or two are being charged at a time, as the greater part of the voltage or pressure is used in the lamps that must be in circuit. As only five volts are required to charge one, and ten volts to charge two four-volt accumulators, and as the house supply is 200 volts, it is necessary to guard against getting this full pressure on to the accumulators, by having lamps of the ordinary type used in the house in circuit with the batteries, so that the current flows through the lamps and then on through the accumulators. The lamps regulate the actual

Diagram of Arrangement for Charging Accumulators from 200-volt Continuous Current Electric Light Circuit.

The switch bridges across from C to either A or B according to its position. When the switch is at A the switch is acting as an ordinary wall switch, and the current flows through the lamps as usual, but when it is at B the current can only flow to the wall plug, and from thence through the accumulator when the plug top has been fixed in position. The accumulator connections can be made before the plug is put in, to avoid risk of shock, and the plug must always be put in the same way, that is with the positive side on the side which should be marked positive. A line of paint down one side of the chime plug will make this easy.

current that the accumulator gets—that is to say, as a 16-c.p. lamp takes one-third of an ampere, you will require to have three such lamps in circuit if you wish to have a current of an ampere through the accumulators. An electrician with full knowledge of what he was doing would charge the accumulators from a switch that is controlling three lamps on an electrolier, the switch being kept at the off position, and the two wires from the accumulators being connected with the switch so as to bridge it. The accumulators then form a circuit through which the current can pass, though the switch is not on.

The best method for safe working is as follows:—Procure from an electricians' depot a small base board fitted with a two-way tumbler switch and an ordinary wall plug. These are wired up on the board, as in diagram, and two wires of different colours, preferably red and black, are wired to the wall plug top, these being provided for connecting to the accumulators. The charging board has to be inserted in the wires on one side of a circuit supplying, say, five lamps, and when fixed the positive and negative terminals should be tested for, and the wall plug marked so that the red wire is always positive when

the plug top is put in, and the black wire is negative. These are then always connected to the correct terminals of the accumulators, namely, positive to positive, and negative to negative. When the accumulators are not charging the plug top can be taken out and the switch turned to A, when the current flows direct through the circuit as usual; but with switch at B the current is deviated round through the wall plug, and with the plug top in, and the wires joined up to the accumulators, the circuit is completed through them. With five lamps in circuit the current will be about $1\frac{1}{2}$ amperes; this can be increased or decreased by altering the candle-power and number of the lamps. There is no possibility of short-circuiting the accumulators by this arrangement as the two-way switch prevents this, and the plug top, with its connecting wires, makes a safe and easy method of connecting the accumulators without risk of shock from the circuit. It would be advisable to have the work done properly by a wiring electrician.

UNATTENDED MOTOR-CARS.

WHETHER it be merely a coincidence, or whether there is a national outbreak of police vigilance against motorists who leave their cars unattended, we know not. Certainly there have been many cases before the courts of late, and the reader can be assured that it is dangerous to leave his motor vehicle in the street. A motorist residing in Bath recently drove up to a restaurant in the High Street, Bridgwater. He left his car by the pavement while he made a hurried tea in the shop. Result, a summons to appear before the Bench, charged with obstructing the traffic. Fortunately, he was able to say that a carriage and pair were also outside the restaurant, and the magistrates dismissed the case—owing to an equal division of opinion among them. At Matlock three motorists similarly called to court have been less fortunate, fines following, apparently as a matter of course.

On this matter of leaving cars unattended motorists should be familiar with the legal aspect. This is not difficult to follow. The first part finds expression in the Motor Cars (Use and Construction) Order, 1904, Clause 2 of Article IV. of which, referring to the driver, says, "he shall not, when on the motor-car, be in such a position that he cannot have control over the same, or that he cannot obtain a full view of the road and traffic ahead of the motor-car, or quit the motor-car without having taken due precautions against its being started in his absence, or allow the motor-car or a vehicle driven thereby to stand on such highway so as to cause any unnecessary obstruction thereof."

In taking action against the motorist the police should actually prove the obstruction. Often they are very careless in their evidence on such point, and if the motorist can produce witnesses who passed him on the roadway in vehicles while his car was stationary, division on the Bench may lead to his acquittal.

We had an opportunity the other day of inspecting the first of the new Badminton cars which are shortly to be put on the market by Badminton Motors, Ltd. The vehicle is of 14-20-h.p., and while following the general lines of live axle vehicles, comprises several interesting details, notably as regards the clutch and cardan shaft. The four-cylinder engine, which is 90 mm. bore by 110 mm. stroke, is provided with an automatic carburettor of the Krebs type and high tension magneto ignition. The clutch is of the disc pattern, alternate bronze and steel plates of rather greater thickness than usual being employed. The cardan shaft is entirely enclosed in a casing, which acts as the torque rod; it extends from the differential case to a crescent-shaped piece pivoted to one of the cross members of the frame. The cardan shaft and casing are thus free to adjust themselves to the inequalities of the road. The first chassis has been built in France, but we understand from Messrs. Teste and Lassen, of 9, Warwick Street, London, W., who are interested in the new concern, that arrangements are in hand for the complete production of the vehicles in this country.

NEW members of the R.A.C. include Earl Poulett, Lord Alexander Thynne, Captain H. R. Hayter, and Mr. W. Campbell, K.C.

AN order has recently been issued announcing that motor-cars may be imported into Paraguay free of import duty for a period of two years from June 26th last.

WE illustrate herewith a new chassis which is being introduced by the Hotchkiss Company for the 1908 season to meet

Chassis of the new Hotchkiss 16-20-h.p. Car.

the growing demand for a high-class car of moderate horse-power and price. The vehicle, which follows the usual lines of the Hotchkiss cars, is provided with a four-cylinder engine rated at 16-20-h.p., the bore and stroke being respectively 95 mm. and 110 mm. The ignition is by high-tension magneto, and the speed of the motor is controlled by both hand and foot levers. The transmission is through a leather-faced cone clutch, gate-controlled change-speed gear giving four forward speeds and a reverse, cardan shaft and bevel gear to a live axle. The brakes are of the internal expanding type and the pressed steel frame is narrowed at the front to give a large lock, and raised at the rear to clear the differential casing. Special attention has been devoted to the suspension, three-quarter elliptic springs being employed at the rear. The car, which has a wheel base of 9 ft. 6½ in., is mounted on equal sized road wheels, 875 mm. by 105 mm. tyres being fitted. The London and Parisian Motor Company, the British agents, inform us that the new model has been subjected to extensive trials and has proved itself to be both speedy on ordinary roads and a good hill-climber.

AN inquiry by the Local Government Board Inspector for the limitation of the speed of motor-cars to ten miles per hour took place at Bromley, Kent, on Monday; on Wednesday a similar inquiry was held at Mere, Wiltshire, into the application of the County Council to close the road to motor-cars.

MR. T. SPONG, of 205, Shaftesbury Avenue, London, W.C., is open to contract on weekly, monthly or yearly arrangements for the supply of tyres, tubes, oil, petrol, &c., for any make of car. He is also arranging for cleaning and garaging cars, and generally placing himself at the service of motorists.

A CURIOUS incident has just come to light in connection with the recent visit of the King to Perth, when he passed through the General Station en route for Advie. Two days afterwards His Majesty's motor-car, while passing up North Methven Street, was stopped by a constable of the city police. Unaware of the fact that the car belonged to His Majesty, with quiet dignity the constable inquired of the chauffeur why the car was not registered. With a smile His Majesty's chauffeur politely informed the constable that such a privilege was only extended to the King, and the constable, comprehending the situation, allowed the car to pass.

HERE AND THERE.

ST. DAVID'S FREE CHURCH, in the Ward Road, Dundee, will shortly be transformed into a motor garage by Mr. Thomas Shaw.

CAPTAIN WOOD'S 30-h.p.

Daimler made a non-stop run in the Aga Khan Motor Reliability Trial for cars driven by amateurs last month. It was also first in the Khandalla Ghat hill climb.

THE 8-h.p. Rover car employed by the Motor Union inspector for road agency work has now completed 4,000 miles in a little over six weeks.

THE Cheshire Automobile Club has passed a new bye-law to the effect that persons employed or engaged in the motor trade shall not be eligible to take part in the competitions of the club.

WE join with the Rev. Canon Barrett, of Barnet, in hoping that motorists passing through the town on Sundays will do so with as little noise, particularly horn blowing, as possible during the time the congregations are at church.

TUITION in motor tyre repairing is now a feature in the educational programme at some of the London and provincial polytechnic schools, Messrs. Harvey Frest and Co.'s vulcanisers being frequently used for demonstrating purposes. The firm are willing to loan an appliance to any established school.

MR. THOMAS STRONG is arranging for the Clifton Baths Garage, Cliftonville, Margate, to have accommodation for fifty vehicles. Private lock-ups for cars will shortly be added. At his place in Victoria Road, Margate, he stocks accessories and sundries, and undertakes all kinds of motor-car repairs as well as the letting of cars for hire.

THE accompanying illustration shows the 40-h.p. six-cylinder Napier which started on the 30th ult. on a 3,000 mile trial of Simcar benzol under the observation and supervision of the Royal Automobile Club. The distance run on each day

The Car starting from the Red Lion Hotel, Hatfield.

since the commencement of the trial is 150 miles, the consumption of fuel on the first day being 7 gallons of benzol; on the second 6 gallons 4 pints 14 oz.; on the third 6 gallons 3 pints; and on the fourth 7 gallons 5 pints 8 oz., giving an average for the four days of twenty-two miles per gallon.

AN excellent garage with accommodation for a score of cars is run by the Monmouth Motor and Cycle Company, Ltd., in Priory Street, Monmouth. An attendant is to be found on the premises by night as well as by day.

MR. H. GARNER, of Nantwich, has joined Argylls (Midlands) Ltd.

IN the London Road, Derby, Mr. H. Butler has opened a new garage and motor works.

DURING the month of September 164 motorists joined the Motor Union directly as individual members.

IN connection with the centenary fund of the Primitive Methodist Churches a motor-car campaign for the county of Lincolnshire has commenced at Crowle, a car having been placed at the disposal of the deputation by Mr. T. R. Watkinson, J.P., of Grimsby.

COLONEL R. E. CROMPTON, C.B., has given his opinion that the Dust Committee of the R.A.C. has learned a great deal as the result of the recent experiments at Brooklands, and they will be able to place a definite report before the manufacturers which will be of great service to designers.

SUBSCRIPTIONS of 50 guineas and 20 guineas have been given by the R.A.C. and the Motor Union respectively towards the appeal on behalf of Mr. Joseph Taylor, of Maidenhead, whose work in connection with the freeing of the Maidenhead and Windsor tolls is well known to motorists.

THE Relations Committee of the R.A.C. is to be called together on the 23rd inst. to investigate the situation arising out of the controversy between the Motor Union and the Automobile Association in so far as the club is affected by that controversy. It is being asked to report to the first meeting of the club Committee, to be held in November.

WE illustrate a new jack known as the "Duco" No. 3, which has lately been put on the market by Messrs. Brown Bros., Ltd. The tool, which is fitted with a patent universal handle joint, has a body made from best hematite iron, and annealed; the screws are of steel, and the other parts of malleable iron. The jack, which is fitted with hand adjustment, and will lift a ton, weighs 5½ lbs.; its height when down is 10 in., and when extended 16 in., giving a range of 6 in.

ON the invitation of Mr. Turpin, the work's manager, we recently made a tour of inspection of the Panhard Works at Acton, W. Since acquiring the new premises a considerable extension has taken place in all branches, the firm being now able to undertake repairs to any make of car, Spyker, Horch, Humber, Decauville, Austin, and other vehicles being under treatment at the time of our visit. A special feature is made of the lengthening of chassis and conversion of the now obsolete rear-entrance vehicles to the more convenient and roomy side-entrance type; as this alteration requires coach-builders' work, a very complete installation has been put in, comprising body-building, upholstering, painting and enamelling and wheelwright departments. Another important branch is the manufacture of the Dunlop detachable rim, and the adapting and fitting of the same to the present type of road wheel. Repairs to cylinders by the acetylene-oxygen welding process were also in operation, while other departments include those devoted to the repairing of ignition magnetos, lamps, &c.; there is also a very complete smith's shop in which all patterns of forgings are turned out and axles straightened. With such facilities the Panhard Works are able to make any part not procurable from the original makers, and thus guarantee a date of delivery for any repair work undertaken. In addition to this important side a very large stock of spare parts for Panhard cars is kept on hand, this section requiring four floors of the building to accommodate them. Mr. Turpin has shown the keen interest he takes in the well-being of his large staff by providing very fine mess rooms and recreation rooms for the employees, while the neatness and order evident throughout the whole establishment points conclusively to the fact that the system employed under his direction is complete in every detail.

A MAIL motor service is to be started between Cosham Petersfield, and Haslemere.

MR. W. SMITH, of Eton Stret, Richmond, has a garage for sixty cars at his works in the Quadrant Road, near the railway station.

THE attempt of Lieut. Graetze to cross Africa by motor-car has been quickly frustrated, the car being at present stranded about 200 miles from the starting point, with four cracked cylinders.

THE Scottish A.C. have agreed to appropriate £500 for the erection of road signs and to remit to the Touring Committee to consider the matter fully and submit a scheme to the next meeting of the General Committee.

IN a recent number, the New York "Motor" published an interesting article on the equipment of a private garage, from the pen of Mr. Wesley Hawkes, a condensation of which will be found elsewhere in the present issue.

BENZOL, as a fuel for petrol motor vehicles, is now being supplied by Messrs. Sadler and Co., Ltd., Middlesbrough; the Staffordshire Chemical Co., Chatterley; and the Simon and Carves Bye-Product Coke-Oven Construction and Working Co., Ltd., Manchester.

A FINE of 40s. and costs was imposed, at Feltham Petty Sessions, on Monday, on the navigator of a motor-launch in Teddington Lock cut on a recent Sunday, without special care and caution, and at a speed and in a manner so as to endanger the safety of such vessels. Waves set up by the launch washed into a punt and wetted the occupants, soaking the carpets, cushions, and clothing lying at the bottom of the craft.

AT the recent Notts A.C. Hill Climb, held at Hazlewood Hill, Daimler cars made the first, second and third fastest times of the meeting. This makes the twenty-fifth time during the past season that Daimler cars have made fastest times of all cars competing at club competitions, and the second occasion on which they have made first, second and third fastest times. The majority of the wins were made by privately owned and driven cars of standard pattern.

DURING the stay of the commercial vehicles in the R.A.C. trials in Sheffield, a visit was paid to the works of Messrs. W. Jessop and Sons, Ltd., at Brightside. About twenty of the leading representatives of the motor industry following the trials went down in a motor-bus, and spent a very enjoyable morning. Messrs. Jessop have paid great attention to the requirements of motor manufacturers, and have successfully applied their efforts to the production of the special steels which the industry calls for.

AT the testing station of the British Fire Prevention Committee, Regent's Park, N.W., an interesting demonstration was given on Wednesday last week with petrol tanks fitted with safety devices to prevent explosion in case of fire. The display was arranged by the Safety Non-Explosive Reservoir Company, Ltd., of Alderman's House, Alderman's Walk, E.C., who provided vessels fitted with the safety device made in accordance with the Henze patents. This consists of a metal safety plug and an interior wire gauze safety tube, constructed on the well-known principles of the wire gauze cylinder in the Davy miner's lamp. A metal petrol tank, similar to that carried on many motor-cars, was surrounded by wood and other inflammatory materials, forming a huge bonfire. The tank was half-full of petrol, and the bonfire was lighted, petrol being poured on it to increase its intensity. After some minutes the fusible plug in the tank melted, and was blown out by the gas accumulated in the tank. In the ordinary way an explosion bursting the tank would have happened, but, instead, the gas simply lighted and was easily extinguished. A further demonstration was given by placing an ordinary motor-spirit tin filled with petrol and a safety petrol tank in the bonfire together. The can of spirit, after being in the fire for some time, blew up 30 ft. in the air, and landed some twenty yards away. The safety tank, on the other hand, behaved admirably, the plug and gauze tube allowing the gas to burn quietly, no explosion taking place. The new invention is one worthy of the close attention of all interested in the safe storage of petrol and other inflammable liquids.

SOME USEFUL NOTES.

IN a single or even a double-cylinder motor it is very easy to determine whether there is a freedom from leaks and whether the proper compression pressure is attained, by the "feel" of the starting handle when the latter is turned over, with the ignition switched off and the throttle partly open. If, when the handle is being pulled against the compression stroke, there is a constantly increasing resistance transmitted to the hand through the starting handle up to the time that the dead centre is passed, no matter how slowly the handle is turned, one may feel confident that the compression is good. If, on the contrary, there is no such springy resistance, unless the handle is rotated suddenly and energetically, and if the compression stroke may be completed with very little effort when passed slowly and gradually, the compression is faulty.

GOOD modern petrol motors, when in condition, operate practically without any knocking sounds. The motorist's ears should, therefore, be on the alert for any unusual noise proceeding from the engine. When a knock that is evidently not attributable to a too advanced ignition begins to develop, the danger signal which it conveys should be at once heeded. If such sounds develop rather suddenly it is a fairly sure sign that the engine has become hot from lack of oil or of water circulation. If the cause is pre-ignition, due to incandescent carbon deposits in the combustion space, the trouble will probably have been noticed before and will cause no immediate anxiety. The difficulty may be due to a loosening of the connecting rod bearings on the crank pins or to a loosening of some other mechanical fastening about the motor.

If the cylinders of a petrol engine become more than normally hot and the pistons move with difficulty and squeak, the trouble is probably lack of cylinder lubrication, while, if the cylinders are very hot and the radiator is comparatively cool, the difficulty is presumably one of lack of water or of defective circulation. A hot engine, if attended to at once and allowed to cool gradually, will probably not be seriously injured by the experience. The copious feeding of oil to the heated parts and a very cautious supply of cold water to the engine jackets, so long as they are intensely hot, are advisable.

"KNOCKING" due to the engine's overheating and self-igniting its charges is of a peculiarly sharp, almost metallic, clanging nature, and is generally accompanied by considerable smoke arising from the burning off of oil from the outsides of the cylinders. There is usually, too, a very offensive and pungent exhaust produced from the incomplete combustion of the charges, when the motor runs after the current is switched off. A knock produced by mechanical looseness is of a less sharp nature, but louder, and shakes the car more noticeably.

IMPERFECT inflation is responsible, to a greater extent than anything else, for tyre "bursts" and quick disintegration. When a tyre is not sufficiently pumped up the walls are continually bending backwards and forwards as the car moves, with the same result as when a wire or piece of metal is bent backwards and forwards, that is, heat is engendered in the threads, as a result of which they soon weaken, and in a short time the inner walls are no longer strong enough to support the air pressure multiplied by the weight of the car, and "bursts" result.

LACK of lubrication in a particular cylinder may sometimes cause so much friction at that point that the cylinder will lag, and, especially at low throttle openings, will add little or nothing to the power of the engine. Under such conditions the particular cylinder will probably heat excessively, and may become so hot as to develop pre-ignition and "knocking." Conditions such as these are, however, likely to be detected during the operation of starting the motor, or by a squeaking sound when the engine is running.

A NEW AUTOMATIC ENGINE STARTER.

IN connection with the recent correspondence on the subject of engine starting devices the following particulars of a new arrangement which has lately been put upon the market by the Auto Improvement Company, of Hudson Street, New York, U.S.A., may be of interest. The starter, which is known as the "Ever Ready," is designed for attachment to the front of a car in the place usually occupied by the starting handle. The device, which is enclosed in a brass casing, consists of a spiral spring of considerable weight. Pre-supposing the spring E to have been wound tight, it is released for starting by a slight rotation of the lever D about its spindle, which releases the clutch band or shoe F, through a toggle linkage, from engagement with the disc, upon which are mounted the pawls I (Fig. 3), engaging with the ratchet wheel H mounted upon the spindle with the forward member of the jaw clutch C (Fig. 1). The inner end of the spiral spring E is positively connected with the internal ratchet J, and the engagement for starting is thus accomplished through J and its pawl, which are mounted on the disc with the pawls I, and the ratchet and pawls

H and I. The lever D, through the action of a spring shown in Fig. 3, normally holds the brake band F in engagement with the disc, it being released by a pedal on the driver's footboard, and connected to D by a wire or rod. After the engine has been started the pawls L, which are enclosed within the spherical shaped part of the casing, engage, as shown in Fig. 2, with a member attached to the spindle, upon which is carried the inner pinion of a set of planetary gears. With the spring wound to the limit set by its adjustment, the pawls L are shifted endwise on the spindle by a thread-actuated device until they are released from engagement with the pinion. When the spring is unwound they are again brought into engagement by the screw. The spring is rewound by the engine through the jaw clutch C, the pawls L and the planetary set, with a reduction of motion of 10 to 1 from the engine shaft, and is held in a wound condition by the brake band F until that band is again released by the pedal through the movement of the lever D. The forward end of the device is provided with a clutch for the engagement of a telescopic starting-handle with either the rewinding pawls or the engine shaft direct through the clutch C. Should the device, through failure of the engine to start owing to imperfect carburation or ignition, become unwound, it may be readily rewound by hand with only a small expenditure of energy on the part of the operator.

THE British Consul General at Constantinople reports that the importation into Turkey of petrol motor bicycles and cars has been authorized by a recent Customs circular. Their use in towns is, however, prohibited.

THE CLOTHIER AND THE CAR.

FOLLOWING what we wrote last week with reference to the clothing of motorists, we would now emphasise the position that Irish frieze has taken in connection with the subject, while the introduction of the detachable lining is another point of interest. In fact, this latter development is one of the most noticeable features of the present position. They both arise from the desire to secure motor clothing that shall appear as not out of the ordinary when the motorist is walking, and to have one garment always available, no matter what the weather may be like.

A. DUNHILL, LTD.

Among those who have specialised in motoring equipment, Messrs. Alfred Dunhill, Ltd., of Euston Road and Conduit Street, London, early attained distinction, which they have maintained through succeeding seasons. The desire has been to bring out raiment for motorists which can also be worn when not on the car without attracting undue attention to the wearer. In this connection mention may be made of

The "Hillingdon" Coat.

the "Hillingdon" coat, a stylish garment of specially close woven Irish frieze, which is one of the most practical motoring coats we have lately inspected. The wind, which in many garments is not wholly excluded from the chest when the wearer is in a sitting position, is effectively kept out in the Hillingdon coat by the introduction of a wind flap buttoning on to the same buttons as those which close the coat over the chest. An extra wide skirt is given to the coat, rendering it comfortable when the wearer is sitting, and, in fact, it acts as an apron. Being pleated at the back, so that it can be taken in by a short belt, an ordinary appearance is given to the garment when walking. The style of buttoning the collar to give security to the neck from wind and rain is ingenious and effective, and the firm are to be congratulated on the success of their efforts in this direction. "Umbrella" coats and other distinctive motor costumes are also included in the stock of clothing for gentlemen. In the ladies' department are many fashionable garments, some striking novelties being shown in leather costumes, notably one in soft green leather with undervest of pale embroidered mauve suede and hat to match. There is also an excellent "slip-on" wrap in vicuna for all seasons. This is provided with ingeniously arranged collar and sleeves which can be worn in a variety of different styles. Drencher proof tweed coats, Harris spun tweed coats, the "Kennard" mackintosh, designed by one of the pioneers of lady motorists, and hats, hoods, and vells are also included in their specialities. The catalogue issued by Messrs. Alfred Dunhill, Ltd., in connection with their clothing department is one of the most complete works of the kind lately published.

HOARE AND SONS.

At their Central House, 252-254, High Holborn, W.C., Messrs. Hoare and Sons have a selection of motor clothing which will commend itself to many motorists in the reasonableness of its price. For the season they have introduced the "Smok-ett" coat, which is described as a waterproof without rubber. As a long double-breasted motor coat with ample skirt the garment should find much favour. It is light when worn, of good appearance, and amply withstands storm, wind and rain. As a new garment for motorists the "Smok-ett" should attract considerable attention and become a recognised fashionable garment. Mention must also be made of other standard styles designed and executed in the workshops of Messrs. Hoare and Sons. The "Rex" can be supplied with all-wool or leather lining as desired, and affords adequate protection against all weathers. It can be worn on or off the car without exciting the notice of the man in the street. The fur-lined motor coats which the firm supply combine a high grade of cloth with choice fur, and should satisfy the most exacting patrons of such goods. As an advance on the original parapluie the "Storm smock" brought out by Messrs. Hoare and Sons is a distinct success, securing the same immunity from wet, but, dispensing with the rubber neck, having an efficient substitute in a new plan of closing the neck and chest, by a protector which adds to the protection from the weather. Motoring "slip overs," a patent motor cloak with telescopic sleeves, and other garments testify to the firm's good work as motorists' tailors. They are also specialising on liveries, in which department the same regard to reasonable prices is shown.

WHOLESALE FUR CO.

Although men have not increased their partiality for fur garments when motoring, ladies seem to have naturally retained their liking for raiment of that description. A reference to the specialities of the Wholesale Fur Co., of 201, Regent Street, W., is proof of such a fact, for there are to be seen several types of fur-lined motor coats, handsome in appearance and evidently warm and comfortable to wear. An elegant model is that known as the Panhard. This has a large storm collar, to turn up or down, and, made in the firm's specially selected dark natural musquash, lined with grey and white squirrel, is a most effective coat. The Darracq coat, in mole grey squirrel, is a stylish and graceful model. This is trimmed with silver pointed fox, and can be had lined rich quilted or plain satin. Lined with the latter material and made in natural musquash, the coat is indeed a striking garment. Recognising that garments of this description have to be worn on diverse occasions, frequently over a dinner gown or ball dress during an evening drive, when warmth combined with lightness in weight are so especially desirable, or at other times over tailor-made gowns and coats and similar garments whilst hunting, driving, motoring and travelling, it is important that there should be ample room for all such contingencies. With this important point in view special attention has to be given to the arm-holes and sleeves, so that the coats slip on readily and are worn with comfort, without sacrificing elegance of style; also the appearance of unnecessary bulk is avoided. The firm have also brought out a new automobile coat known as the Brooklands, produced in elegant shades of heather mixture, tweeds, Cheviots, &c., in various fur lining.

LOVEGROVE'S.

Messrs. Lovegrove's, the well-known motoring tailors, are removing from 175, Piccadilly, to the first floor of 169, Piccadilly, London, W., where they are showing a comprehensive selection of clothing of the latest styles, both for ladies and gentlemen. Among the specialities are very smart ladies' leather boleros in several colours; skirts of leather and cloth skirts trimmed with leather intended to be worn with the bolero, a combination which makes a useful and stylish costume; ladies' leather motor coats lined with fur or camel fleece. An excellent waterproof overall is another good line. In motor hoods the firm has several good types, the "Sandringham" being a very interesting accessory. This is made in coloured leather trimmed and lined with various furs as required. By bonding a wire lying within the rim the shape can be altered for variety. In gentlemen's clothing are some fashionable garments in Irish friezes, tweeds, etc., including a travelling coat which has been much appreciated by medical motorists, who have recognised the hygienic principles upon which it is constructed. It is made from frieze cloth lined with camel fleece, and interlined with a special woven material. It has large pockets to hold bulky cases. A section of the business in which Messrs. Lovegrove's have attained much distinction is concerned with liveries. In these we noticed a special landaulet livery, designed specially for use in town. The collar, cuffs, and hat are trimmed in bold contrast. A chauffeur's livery is also made in velvet cord reefers, friezes, and meltons, in colours to match the car. In addition to the garments we have enumerated, the firm have a large selection of caps, gloves, &c., and are able to clothe the motorist in the latest styles, based upon a practical acquaintance with the requirements of motorists.

MESSRS. HENRY ANGUS, SANDERSON AND Co., of Westgate Road and Percy Street, Newcastle-on-Tyne, have been appointed by Messrs. S. F. Edge, Ltd., sole agents for the six-cylinder Napier cars for Northumberland, Durham, and Cumberland.

WE learn that the Samson Non-skid Company have installed an up-to-date vulcanizing plant at their factory at Hythe Road, Willeston Junction, and are now able to undertake all classes of repair work as well as the re-rubbing of tyre covers.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

MOTOR-CAR DESIGN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—A considerable amount of discussion took place at the recent meeting of the Institute of Carriage Manufacturers, as to the ideal type of motor-car. The discussion was taken part in not only by carriage builders but also by engineers; and while obviously, so long as the present standard type of car is so enormously in the majority, the average motor-car engineer is fairly well tied to uphold that type, it was equally obvious from the discussion that not only most of the carriage builders were dissatisfied with the present type but that also many engineers recognised its faults and desired to see radical improvements.

A very interesting paper was read by Mr. Baillie dealing fully with the various types of cars which are manufactured. He was kind enough to refer to the N.E.C. cars at considerable length. It seems to us that whatever view is held as to future development, it is a subject on which could be based a very interesting discussion in your paper,

and theatre work, and for doctors. It must take the place of the train for ever increasing distances, and all this besides being a mere speed vehicle for sporting purposes.

It goes almost without saying that for a car to fulfil all these purposes it must be thoroughly reliable and stoutly built, besides being as free as possible from complication, easy to keep in order, and simple to drive. This standard has been pretty well attained by all cars of repute. Given a careful driver, there are many cars on the market which can be depended upon as consistent performers. No new type of car which does not possess these features can hope to succeed. These points were scarcely mentioned in the discussion by the Institute of Carriage Manufacturers; instead, the points raised were those we had in mind five years ago when we designed our cars. They are perhaps best put by giving the faults of the standard type of car. These are lack of comfort, convenience and accommodation and poor appearance.

In short, the engineer in perfecting his part has disregarded the passenger, the *raison d'être* of the car. He has failed to realise that

The Adler Fahrradwerke Gesellschaft, the makers of the Adler Cars, have recently established a large open-air motor-driving track in Frankfurt-am-Main. Among its features is a series of panoramic pictures, one of which is reproduced above, representing the humorous side of motoring and cycling, by Herr Emil Kneiss, a well-known artist of Munich.

one which would be of real value to manufacturers and to the buying public as well; for even the strongest advocate of the common type of car of to-day must admit that there is a great probability of newer forms establishing themselves in a strong position. We ourselves have devoted five years to the production of an uncommon type of vehicle. We set out to secure advantages which we believe an ideal car must have, and in our opinion we have completely succeeded.

The general outline of our cars was arranged at the very commencement. If any of your readers will carry their minds back to the early days of the movement, they will recollect what dreadful things were the motor-cars of that period, small, uncomfortable, uncouth, things apart, scoffed at as the competitors of elegant luxurious carriages. So that, without wishing to boast, we really were a long way ahead when we drew, five years ago, the outlines of the cars which we are actually building to-day. Between that time and this the motor-car has changed enormously in its uses and in its fitness. It is, nowadays, a necessity, the private Pullman of the wealthy and the greatest source of pleasure of the well-to-do. Every day sees its influence spreading. The horse for carriage purposes is on the very verge of extinction, so that now the motor-car must take the place of the elegant town carriage for the park, for shopping, for calling, for dinner

as his part was perfected so it could be modified, that its general outlines were the outcome of early imperfections. Besides this, in overcoming certain defects he has very materially made other faults still worse. The bonnet is certainly the outcome of first, faulty engines which required to be constantly got at, and secondly, ill-considered and faultily designed motors, which were intended to occupy positions other than under the bonnet. The six-cylinder engine has very much increased the disadvantage of the bonnet. The bonnet being in existence, it follows that comfort, convenience, accommodation, and appearance must all suffer from serious limitations. Once the body is driven back over the rear axle, there must be unduly stiff springs to prevent the body and axle bumping together; this means discomfort from road vibration. Then, the back seat being behind the axle instead of in front of it, its movement is magnified, adding to the discomfort. Furthermore, to get the carriage a reasonable height from the ground, small wheels must be used, since the body cannot be lowered unless the axle is lowered. Then the rear wheels coming far forward in relation to the back (or main) portion of the body, there is great difficulty in securing a really convenient door. Also the body is high, to avoid hitting the axle, two steps have frequently to be arranged, and getting in and out of the car becomes quite difficult.

By throwing the body back indefinitely behind the rear axle any accommodation can be secured, but owners object to the discomfort which must be incurred or the accommodation curtailed. Appearance is a matter of personal taste and habit, but a fairly safe rule is that what is evidently best suited to the purpose will have the best appearance; and this applied to motor-cars means that the more carriage there is and the less machinery, the more there is obviously comfort and convenience and good accommodation, the better will the appearance of the car be.

The two facts which in our opinion are becoming more and more obvious every day are that the only object of the car is that it shall minister to the enjoyment and comfort of its owner, and that the early mechanical imperfections are so far eliminated that the design of the machinery can be radically altered to secure the improvements of a car in the sense of a carriage. To-day, in the light of experience, it seems quite obvious that the reason why some bonnetless cars have not succeeded better is that their designers have not understood the real reason why the bonnet must go. Almost invariably their great ambition has been to secure a short wheel base. In our opinion this is a very minor consideration, and, since a short wheel base means unquestionably loss of comfort, it is a feature that would tell rather against than for a car. In the case of our own vehicle we score to the extent of nearly 3 ft. in length by suppressing the bonnet. Our car has a wheel base of 10 ft. 6 in., which corresponds exactly with the wheel base of any similar vehicle with a bonnet. By keeping this wheel base we get the body slung completely within the wheels and so secure extraordinary comfort. By shortening the wheel base we should

Mr. Chas. MacIver, of Messrs. David MacIver and Co., Liverpool, and Beechfield, Heswall, at the wheel of his 10-12-h.p. landaulet, which he constantly uses for running across the Wirral peninsula to Birkenhead twice a day, and frequently to Chester and the surrounding district.

turn in a somewhat smaller circle, but the car would be even more uncomfortable to ride in than the one with the bonnet.

The difference between the ordinary type of vehicle and our own is well brought out in the following table, which shows how easily we can get our body "within the wheels" and how impossible it is when the engine is under a bonnet:—

Car.	Wheel Base.	Distance from dash to front of rear wheel.
Fiat	10 ft. 6 in. ...	5 ft. 8½ in.
Napier	11 ft. ...	5 ft. 3½ in.
Delannay-Belleville ...	10 ft. 6 in. ...	5 ft. 8 in.
New Engine Co.	10 ft. 6 in. ...	8 ft. 4½ in.

Briefly, what we claim for our type, and what we believe all designers will have to endeavour to secure, are that the body is completely within the axles and slung low, so that we can get the maximum comfort possible and have convenience of ingress and egress, for we are not hampered in the position and design of the door, and the step and floor of the car are low. We also secure greater accommodation on the same wheel base; and since the whole space is given up to the carriage body, and since the car is very obviously a comfortable and convenient carriage, it has therefore an improved appearance, as compared with a vehicle with a bonnet.—Yours truly,

J. C. MORT.

New Engine (Motor) Co., Ltd.

THE NEW ROUTE TO IRELAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been following with much interest the series of letters which appeared recently in your widely-read Journal re the excellent Fishguard-Rosslare passenger route between England and Wales and the South of Ireland. In a business connection I really cannot understand why the Great Western Railway Company do not advertise or make known to motor-car owners the splendid facilities offered by the route for the conveyance of motor-cars, inasmuch as to my mind it is one of the most perfect routes in that respect I know of, having excellent and up-to-date methods for the careful shipment and the discharging of all cars committed to their charge.

By booking their cars by this route, owners have one hour to rest themselves and to see their cars transferred safely from the direct boat to the main road, this work being carried out under the supervision of Inspector Davies, who always sees to the discharging of motor-cars personally, and has, I may add, about ten years' experience of this class of work. The freight charged on motor-cars up to one ton is £2 3s. 1d., and up to fifty cwt. £2 13s. from Fishguard to Waterford (direct steamer). A magnificent cross Channel steamer leaves Fishguard every night, Sundays excepted, at 11.45, arriving in Waterford at 7.35 the following morning, while owners themselves can take the mail passenger steamer leaving Fishguard for Rosslare and Waterford 2.20 a.m., and arriving at the latter place at 6.25 a.m., and are thus actually in Waterford before their cars.

Here, too, from the telephone office at the Waterford terminus, the tourist can order his supplies of petrol, lubricating oil, charged accumulator, tyres, and if necessary he can order repairs to be carried out on his car and make his mind easy that they will be carefully carried out in "the birthplace of motoring in Ireland." Hoping this information may prove useful and encourage more motor tourists to come over and see the beauties of the South of Ireland.—Yours truly,

W. F. PEARE.

"ONLY A DOG."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers help me to find out the owner of a car which on Saturday last, at 3.25 p.m., near my residence, "Villacot," Laleham Road, Staines, ran over and killed my valuable fox terrier dog? Apart from being a great pet, he was very highly bred, and a prize-winner at recent shows, and his loss to me is considerable. The chauffeur would have stopped, but his master made him go on. The car was a nearly new one, with hood and glass wind shield, and was painted a royal blue with red lining. Unfortunately I was not near enough to see the number, but I should know the car again, as would six others who witnessed the occurrence.—Yours truly,

HAROLD S. BARRETT.

WHEELS FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your valued issue of October 5th, Mr. O. Cook utterly ignores my two letters in previous issues, in which I point out in detail that the various advantages he asks for are to be found in the "K.T." tyre. Personally I have no desire to turn this correspondence into an advertising medium, but I think I may justly ask Mr. Cook to read my earlier letters more carefully before he again states that we are overlooking the real question at issue. Of course, until Mr. Cook does reply to my statements there is nothing more to be said. I have made certain propositions which I claim to be demonstrable, Mr. Cook is at liberty to leave them or assail them as he thinks fit.

With respect to your correspondent—Mr. E. H. Arnott—I have had an opportunity of seeing a diagram of the resilient wheel he mentions. As far as I can see, the whole value of this idea lies in permitting the base of the rubber tyre to spew, and so, to some extent, change its shape. If I am wrong Mr. Arnott will perhaps be good enough to correct me. Now practically the same result is achieved in theory in the Swinehart tyre, which has a narrow neck of rubber below the tread, and in the De Nevers, by the slats cut right through the tread of the tyre at intervals. In other words, Mr. Arnott depends in his tyre on the elastic property of rubber, unaided by air. May I point out that, theoretically, this cannot give the desired results. The rapidity of action of the best steel springs is about eighty-six times per minute, the rapidity of action of the best commercial rubber, such as is used in high-class solid tyres, is about ninety times per minute, but the rapidity of action of air is approximately 1,800 times per minute.

Under average road conditions, the rapidity of action of rubber alone allows a speed of about eighteen miles an hour, although it can be "overdriven" above that speed, but beyond this the atoms of rubber cannot be compelled to vibrate; consequently beyond this point it is impossible for either steel springs or rubber, or any combination of the two, to absorb vibration, which brings us back to the statement in my last letter that the only conceivable means of absorbing vibration, as distinct from shock, lies in a combination of rubber and air, until someone discovers some material which has a rapidity of action very greatly exceeding that of either steel or rubber.

When I stated that a pneumatic tyre would run at forty miles an hour under average conditions without inducing rolling, I did not

mean to say that this was by any means the limit for either the ordinary pneumatic or the "K.T." tyre, but only stated forty miles an hour as being, in my opinion, quite a big enough speed for any reasonable man on the public roads at any time.

I can, if necessary, give you the results of many tests both in the laboratory and on the road, which verify the figures and theory which I have enunciated, but, unfortunately, it would take many times the length of this letter to lay same out completely, and would, perhaps, be outside the scope of this controversy.—Yours truly,

A. ERNEST GELDER.

TYRE TROUBLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is little doubt that your correspondent Mr. Roberts is correct in stating that the heating of a pneumatic tyre when in use is chiefly due to the concussion of the blows struck by the road against the tyre, which is in the direct line of force between these blows and the rim of the wheel. The rim acts as the anvil upon which the tyre is pounded. It is to avoid this action that the Lynton tyre and wheel are so designed that the tyre is never in the direct line of force referred to, and I attribute the remarkable coolness of the new tyre when in use and its consequent long life, almost entirely to the elimination of the hammering action.—Yours truly,

ERNEST H. ARNOTT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think if your correspondent "Galen" (in your issue of September 21st) will use tyres filled with "Elastes" with non-slipping treads, he will greatly diminish his tyre troubles. He should also have the Elastes moveable-flange rim fitted to his driving wheels. If he will refer to the correspondence columns of "The Lancet" of September 21st he will find further information on this subject. I have no financial or other interest in the Elastes Company.—Yours truly,

C. E. ABBOTT.

WIRE VERSUS WOOD WHEELS FOR MOTOR-CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—A serious motor-car accident happened recently near King's Lynn owing to the collapse of the wheels. In all probability the car was fitted with wooden wheels; the natural inference is that this kind of wheel is not always safe. Could such a mishap occur if a car were fitted with wire wheels? In the 60-h.p. race at Brooklands on the 14th ult., one of the tyres on a Napier car, which was fitted with wire wheels, came off almost at the start, but the car went right through the race minus one tyre, travelling towards the finish at over eighty-five miles an hour. The strain on the wheel must have been terrific, yet it held up and was only shaken loose in the process. This raises a question as to the relative value of wood and wire wheels for motor-cars. Can any of your readers express an expert opinion on the point?—Yours truly,

H. F. TRIPPEL.

Major, Army Motor Reserve.

AN ACCUMULATOR CHARGING QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you could give me some information as to the method to be adopted to charge my ignition accumulators from the electric lighting installation in the house of the apparatus necessary in connection therewith. The supply according to the meter is continuous current 200 volts 30 amperes. I may wish to charge the accumulators singly or two at a time. Any information you can give me will be greatly appreciated.—Yours truly,

R. J. BENTLEY.

[The question raised by our correspondent being one of general interest, we have prepared a diagram showing the necessary connections. This, together with an explanatory article, will be found elsewhere in the present issue.]

A STEAM CAR ENTHUSIAST.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In furtherance of my letter of the 21st ult. and Major Perry's reply to same, I note that that gentleman points out that a 30-h.p. Stanley did 127½ miles per hour, and a 200-h.p. Darracq 114 miles. Now I wonder what would be the speed of a 200-h.p. Stanley. I observe that a White steam car enthusiast presents us in the *M.C.J.* with an interesting little account of a steam car tour around Lynmouth. We want to hear just a little every week about steamers, if it is only just to let the "petrolians" know that they are still extant. Personally, as I said in my previous letter, I should like to see some technical analysis of steam cars published now and then; accounts of their construction, accomplishments and failings, would tend to familiarise people with steamers and show the great possibilities of steam as the motive power of road vehicles. Many admit their superiority in hill-climbing, but maintain that the cars cannot keep up the pace, are soon worn out, and are a great deal of trouble. I could never see it, but my opinion

is only one, and is simply the result of dealing in all makes of steam and petrol cars. I certainly think that the maximum power and speed, the minimum weight and complication, the least destructive effect on the driving tyres, and the most luxurious riding, is attained in the steam car.—Yours truly,

HERBERT J. CHAPMAN.

A DIFFERENTIAL GEAR TROUBLE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In running my car up hill the other day the collar at the end of the main shaft of the differential broke, allowing the shaft to slip back and the teeth to come out of mesh. I got home—about a mile—with difficulty, and found several teeth broken. I should be glad if you could inform me whether the shaft slipping would be likely to have caused the breakage of the teeth?—Yours truly,

R. JENNINGS.

[The fact of the shaft slipping back and allowing the teeth of the differential gears to come out of mesh would be quite sufficient to account for the broken teeth, as stated by our correspondent. In fact, it is a wonder that he was able to get home on his own power at all, as all the driving strain is taken on the teeth of the differential pinions. It was, no doubt, due to the pinion becoming jammed that the drive was transmitted, as the car generally remains stationary if these wheels become broken.]

THE Motor Manufacturing Company, Ltd., writes:—"Some little time back we received a telegram money order from Twyford, Berks,

The first State public motor-car service has lately been established between Neumarkt and Predazzo, in the South Tyrol. The illustration shows the old horse-drawn conveyance at the side of its modern rival.

asking for three piston rings to be dispatched, but no name was mentioned, and we have not been able to trace the sender. If this meets the eye of the sender of the money order, perhaps he will communicate with us, when we can execute his command."

GARAGE IN BOMBAY.—We have an inquiry from a Bombay firm anxious to be introduced to a manufacturer or seller of motor-cars in England, who would be willing to assist in opening a garage there.

A STEAM CAR ENTHUSIAST.—Major J. C. P. Perry writes:—"In today's issue of your journal I notice there is a slight error in what you so kindly inserted for me. The sentence, "I want absolute perfection," should read "I won't say absolute perfection."

MR. EDGE'S CHALLENGE.—Considerable correspondence has passed this week between Mr. A. Huntley Walker and Mr. S. F. Edge with reference to the latter's challenge to match his team of Napier cars against the world. In reply to Mr. Huntley Walker's letter, Mr. Edge pointed out that it was a condition of his challenge, when increased from £1,000 to £10,000, that it was to be accepted during September, but Mr. Walker's challenge was not issued until after that date. Expressing his willingness, however, to overlook this omission, Mr. Edge also agreed to race under the 1908 international conditions, or under the Grand Prix 1907 rules. He suggested that the races should take place on the Brooklands track on the 19th inst. In a further letter from Mr. Walker, the latter states that the Brooklands track is not suitable for a long distance race, and suggests that the 500 miles' race should form part of one of next year's international races. He is willing, however, to run the short race at Brooklands to-day (Saturday). The copy to hand of the last letter from Mr. Edge states, "I see you now wish to back out of the long distance race by pretending Brooklands is not a suitable place to hold a long-distance race. On this point I do not agree with you, and I would be willing to race you there, neither of us to use removable wheels or rims."

CLUBS AND ASSOCIATIONS.

AUTO-CYCLE CLUB.

FINE weather favoured the annual open hill climb of the Auto-Cycle Club, which was held at Sharpenhoe, near Luton, on Saturday. The event was originally fixed for Birdlip, but was prohibited by the police. Sharpenhoe did not prove so severe as Birdlip, the smallest powered machine being able to ascend without pedalling. The positions, according to time taken, zero representing fastest in each class, were as follows:—

CLASS I. (machines weighing not more than 110 lbs. and not exceeding 2-h.p.).—W. Smith (1½-h.p. Motosacoche).

CLASS II. (80 by 80).—J. P. Legrand (2½-h.p. Matchless), zero; H. S. Catling (2½-h.p. Anglian), 22 3-5 sec. slower.

CLASS III. (85 by 85).—W. Pollard (3½-h.p. Quadrant), zero; G. Le Evans (3½-h.p. Rex), 1 3-5 sec. slower; E. S. Myers (3½-h.p. Triumph), 9 1-5 sec. slower.

CLASS IV. (twin cylinders, total capacity not exceeding 750 c.c.).—O. C. Godfrey (5-h.p. Rex), zero; F. Applebee, jun. (5-h.p. Rex), 1 sec. slower; W. H. Wells (5-h.p. Vindec Special), 4 1-5 sec. slower.

CLASS V. (any sized engine).—O. C. Godfrey (5-h.p. Rex), zero; G. Le Evans (3½-h.p. Rex), 3-5 sec. slower; F. Applebee, jun. (5-h.p. Rex), 2 1-5 sec. slower.

CLASS VI. (Variable Gear Competition). Two runs up the hill.—H. S. Catling (2½-h.p. Anglian), 2 min. 1 2-5 sec. and 2 min. 11 4-5 sec., total, 4 min. 13 1-5 sec.; C. A. Potts (3½-h.p. Phelon-Moore), 2 min. 41 2-5 sec. and 2 min. 27 1-5 sec., total, 5 min., 8 3-5 sec., 2.

CLASS VII. (Passenger Machines).—Wilbur Gunn (10-h.p. Lagonda), zero; F. Applebee, jun. (6-h.p. Rex Litette), 30 2-5 sec. slower.

The following receive silver medals on A.C.C. formula:—Smith, 872 marks; Catling and Legrand, tie, with 1,020 marks; Pollard, 875 marks; O. L. Summers, 5-h.p. Vindec, 1,005 marks (Class IV.); Lee Evans, 836 marks; S. Riley, 5-h.p. Riley, 870 marks (Class VII.)

NORTHAMPTONSHIRE.

A MEETING of the committee has been held at the George Hotel, Northampton, Mr. F. Bostock presiding. The secretary reported that owing to the Kettering carrier, whom the committee decided to prosecute for obstruction, having sold his business, the prosecution was withdrawn. The following were appointed a sub-committee to consider the question of road signs throughout the county:—Dr. Hope, Dr. J. C. O'Rafferty, Mr. S. Yarde, Mr. Humphrey Bennett, Dr. Simpson, Mr. J. C. Hipwell, Captain Sowerby, and Lord Lilford.

The secretary reported that Dr. Henshaw had written saying that whilst driving his motor-car along the Weedon Road, on September 17th, he had been obstructed for a considerable time by a motor mail van, the driver not allowing him to pass. Captain Goacher, representing Messrs. Mulliner and Co., the owners, and the driver of the van concerned, attended the meeting. The driver, on being questioned, stated that he was not aware he had prevented Dr. Henshaw from passing. As soon as he knew a car was behind he drew to one side. If there had been an obstruction it was quite unintentional, and he was sorry for it. He admitted, however, that when driving a motor mail van it was almost impossible to hear the horn of a car approaching from the rear. Captain Goacher, on behalf of his firm, said he would consider whether some contrivance might be fixed on the vans to enable drivers to see vehicles approaching from behind. The chairman expressed the committee's opinion that the driver in this instance was not to blame.

BROOKLANDS.

IN addition to the races already announced for to-day's (Saturday) meeting at Brooklands, a private stakes has been arranged between Lieut-Colonel Carleton-Smith (40-h.p. Napier), Capt. G. Llewellyn Hinds-Howell (35-h.p. Iris), and Mr. J. Dennis (40-h.p. Dennis). This event will be of the nature of a handicap over a distance of about five miles.

The starts for the Medium Handicap are as follows:—C. Hobson (Brasier), 0; A. Goldschmidt (50-h.p. Pipe), 74 yards; O. Cupper (50-60-h.p. Metallurgique), 269; S. F. Edge (40-h.p. Napier), 432; E. W. Lewis (35-h.p. Deasy), 586; E. de Wilton (30-h.p. Ariel), 644; Capt. W. E. D. Owen (40-h.p. Junior), 718; A. Huntley Walker (30-h.p. Darracq), 925; H. P. MacConnell (24-h.p. Rapid), 1,120.

HERTFORDSHIRE.

THE closing event of the Hertfordshire County A.C.'s season, a meet at the Bull Hotel, Redbourne, Herts., took place last Saturday, when a fair number of members mustered, considering the time of year and the uncertain weather prevailing.

Among those present were Mr. and Mrs. E. Webster, Miss Webster, Mr. and Mrs. Hinshelwood, Mr. and Mrs. E. Baker, Mr. S. F. C. Baker, Miss Orchard, Mr. and Mrs. T. Williams, Mr. and Mrs. F. Peterson, Mr. and Mrs. H. C. Harper and Miss Harper, Mr. D. K. Hal, Messrs. H. W. and A. H. Collier, Mr. H. Oakley Smith, Mr. N. V. C. Turner, Miss Verrey, Mr. and Mrs. Edwards, Dr. H. A. Rudyard, Mr. J. van Hooydonk and Mr. Lowry.

INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

IN view of the fact that the opening meeting of the session of this society clashes with one of the most important days of the Commercial Vehicles Trials, it has been thought advisable to postpone the meeting of the Institution from the 9th inst. to November 20th. This meeting will be held at the Institution of Mechanical Engineers, Storey's Gate, St. James Park, S.W., at 8 p.m., when Colonel R. E. Crompton, C.B., R.E., will be in the chair, and will give his presidential address on "The Future of Automobile Engineering."

SCOTTISH.

WITH a view to interesting the commercial public in commercial motor vehicles and demonstrating the advance which has been made in these, it has been arranged to have a parade of commercial vehicles in Glasgow, on the afternoon of Thursday, October 17th. Vehicles will meet in Blythwood Square at a quarter to two o'clock, and it is intended that they will be driven through the principal streets in and around the city between two and four o'clock. The Club committee have agreed to offer prizes to the drivers of the best kept vehicles as under:—Steam vehicles, two prizes of 20s. and 10s.; petrol vehicles with a carrying capacity exceeding 26 cwt., three prizes of 20s., 10s., 5s.; petrol vehicles with a carrying capacity not exceeding 26 cwt., three prizes of 20s., 10s., and 5s. The judges will be appointed by the Trials Committee of the Club.

The committee appeal to the owners of all commercial vehicles to assist them in making this demonstration and parade a success. They have fixed upon the Thursday as being more likely than a Saturday to suit the convenience of the majority of the owners of such vehicles. They hope that, for the short time involved, a large majority of the owners will be able to allow their vehicles to take part. Manufacturers and dealers are invited to send vehicles, but these will not be eligible for the award of a prize. The matter of carrying loads is optional.

The committee propose having similar parades in other centres at later dates, and Mr. R. J. Smith, the secretary of the Club, 163, West George Street, Glasgow, will be pleased to supply information to intending entrants of vehicles.

MOTOR-CYCLE UNION OF IRELAND.

THE members of the Dublin centre of the Motor Cycle Union of Ireland wound up their competition season with a series of speed trials at Portmarnock on Saturday last. Some very fast speeds were accomplished, S. Findlater on an 8-h.p. twin-cylinder machine covering two miles with a turn in 2 min. 55 sec. He won the handicap very easily from scratch. Mr. E. Drewry on a 5-h.p. twin was second in the two miles and won the twenty miles race; C. B. Franklin, the holder of the cup offered in the latter, being fourth. In the latter race Findlater's belt slipped badly, and he had to retire. Mr. T. W. Murphy acted as starter and timekeeper.

Mr. T. H. RYLAND has resigned from the hon. secretaryship of the Midland A.C. Mr. F. H. Cerrito has been elected as his successor.

THE result of the 100 miles Petrol Consumption and Reliability Trial held on the 18th ult. by the West Essex A.C. has been announced:—First, G. Baddy, 15-h.p. Darracq; second, W. E. Gunnnett, 3-h.p. Triumph; third, A. Ainsworth, 1½-h.p. Motosacoche.

PLACE FOR A GARAGE.—The many replies received to F. V.'s inquiry in the M.C.J. of the 5th inst. have been forwarded to that gentleman.

ARIEL MOTORS (1906) LIMITED, have sent us photographs depicting the interior of one of their showrooms and the entrance to their garage at 101, New Bond Street, W. The showrooms are among the finest in London and cover an area of 8,711 superficial square feet. We understand that the company are now in a position to undertake all kinds of repairs to Ariel-Simplex cars at their London headquarters.

EXTENSIVE improvements are being made in the showrooms of the Deasy Motor Car Manufacturing Company, Ltd., at 10, Brompton Road, S.W. They are coupling up with their present premises those known as 3 and 4, Park Mansions Arcade, which, when completed, will give the company accommodation for about twenty cars, besides providing excellent offices, and a large basement for adjustments, &c.

MESSRS. J. KEELE AND CO. will shortly be moving into their new and larger premises in New Bond Street, W. Owing to their increasing business during this last season, they found it necessary to take premises in Hanover Square, in addition to their present place at Brook Street, and also at Highgate. By the end of November they hope to be in the new establishment, bringing all West-end departments under one roof. The premises selected are in one of the best positions in London, with a showroom measuring 170 ft. long by 30 ft. wide; where Messrs. Keele and Co. will be able to make a large display of the Darracq Enfield, and Belsize cars, for which they are the sole London agents. At the back of the showroom will be workshops and garage. Messrs. J. Keele and Co. have no intention of closing their works at Canston Road, Highgate, as they have a large business in the north of London.

THE EQUIPMENT OF A PRIVATE GARAGE.

In a way, the outfitting of a private garage, or motor house, is very like furnishing a house. There are certain essentials to be provided, and certain definite principles to be followed in their arrangement. Beyond this there is an almost infinite range of possibility in which utility and convenience and comfort may be supplemented by luxury. There are certain essentials which must be procured, and certain methods of arrangement which tend to the greatest convenience in actual use. And, on the other hand, there are a thousand and one things which may be useful sometimes, but which add one more item to the cost of the whole, take up a portion of valuable space, and hence may be classed as luxuries. The main point to be taken into account in considering any problem of the sort is, of course, the kind of occupancy to be provided for. That is to say, is the use to be permanent or transient, or, in the case of the garage, is it to serve merely as a repository, or must provision be made for a certain amount of repair work? And if so, how much?

In coming to a conclusion on this point, a good deal depends upon the owner, perhaps more upon the type of vehicle which is to be housed, and most of all upon the location and degree of isolation from motor repair depots. For while some owners are possessed of a desire to do, or at least to be able to do, all that is required in the permanent upkeep of the car, others are quite willing to get on with as little mechanical work as possible. Moreover, when cars are kept at some distance from the factory or agency, the owner should have on hand at all times a more or less complete stock of spare parts, and

hose, or, better still, an overhead washer of the swivel type. In addition to this, there must be several water pails, a good soft carriage sponge or two, they being now obtainable so fitted in a retaining device that the water from the hose runs through them while they are being used, and a long handled narrow brush suited to the purpose of cleaning inaccessible parts of the gear. Such a brush may be purchased, and should be chosen with an eye to securing the most pliant and yielding bristles possible, so that the painted surfaces shall not be marred by its use. For filling the tanks, suitable funnels fitted with strainers should be provided, those used for petrol, water, and oil being, of course, provided with filtering gauzes of different mesh. For cleaning and polishing several soft chamois skins should be procured, those which are used in cleaning the brass work being kept, for obvious reasons, religiously separated from those which are used on the body surfaces.

It will be found to be a great convenience in caring for the rugs and such motor clothing as is to be kept in the garage, if a closet be provided for this especial purpose. This should be furnished with several deep shelves as well as plenty of hooks, and if there be room on the floor for a trunk or camphor chest, its utility will be apparent when the coming of warm weather compels the laying aside of furs and heavy rugs. In addition to this, and also, in the event of no such provision being deemed needful, it is well to have a long horizontal pole mounted along one wall in suitable brackets, which keep it several inches from the sheathing, over which rugs and dust covers may be thrown for drying and safe keeping.

In connection with the ordinary maintenance of the rolling stock, there are several articles which are very desirable, if not quite essential, to the owner. For instance, there should be some sort of a turntable, or a substitute. This will may be a portable turntable, and, indeed, where it will become necessary to shift the machine or machines about to any

Touring in France.—Lamartine's House at St. Point, near Macon.

space must be provided for them. Hence, taking it all in all, the task has about it quite as large an element of choice as has that of selecting the car itself, or even that of picking out a route for an afternoon's run. There are, however, certain necessities which, in any event, may be set down as a sort of basis for the ultimate choice, and these may be supplemented at the owner's will.

On coming into possession of a motor house the first point for the owner to consider is the degree of provision which has been made for the daily care of the car, and the storage of running supplies. If the building has been designed especially for the purpose, it is to be supposed that a washing place has already been provided, supplied with plenty of running water, and properly drained, and also that some method of storing and handling motor spirit has been installed. For the storage of lubricants, cotton waste, brass polish, varnish cleaner, &c., a suitable closet should be arranged, and handily located. This need not be very large, and requires no elaborate fittings, except that the shelves which are to hold greasy or inflammable materials should be lined with sheet zinc. The metal forms a protection which, besides being kept clean very easily, will not absorb oils as does wood, and hence is far safer than the latter alone. In this closet space should be provided for the storage of all funnels used in refilling the tanks and hooks for the polishing cloths. The closet should be ventilated at the top and bottom so that any fumes may pass out readily. In this way what fire risk there is may be brought entirely within a limited zone, and the danger from accidental or spontaneous combustion thereby greatly reduced, especially when the door is stoutly fastened, and the key habitually carried by the owner or his driver.

As to the equipment required for the other portion of the garage, for the washing process itself there must be at least a good length of

extent, some device of this sort will be found a great saving both in time and labour. Another utility, and one which may be obtained without difficulty, is a set of jacks, four in number, of such a height that when mounted on them the wheels of a car will clear the floor by at least an inch and a half, with the tyres fully inflated. These should be staunchly made, with as narrow a base as possible, stability being secured by a good length on the floor, and should be fastened together with bolts running from side to side, rather than by nails or screws. Also, a fairly large-sized double-acting tyre-pump permanently mounted in an accessible location, or a power pump with air-tank attachment, and furnished with a good length of hose, will be found to be a relief over the common foot pump, when tyre troubles have to be wrestled with. In the case of cars using accumulators for ignition purposes, some sort of charging outfit will have to be provided. This may be a mercury arc rectifier or some other device such as are now on the market for this especial purpose. Current-measuring instruments, such as the voltmeter and ammeter, will be found to be valuable in testing batteries, which it is always wise to do before the car is taken out.

In locating and erecting a work-bench, which is absolutely necessary, even though no great amount of repair work be contemplated at the outset, two factors are of the utmost importance, namely, strength and stability. For probably nothing can contribute more of anguish to the heart of the workman than to be compelled to labour on a rickety bench. And as the nature of the work which is to be done cannot be foretold in the beginning, it is best to build for all time, making the structure as rigid as possible, rather than to risk annoyance later. The uprights should be spaced not more than five feet apart, and should be of well seasoned 3 in. by 4 in. timber. The front of the top should be made of a straight

grained hardwood plank—birch or maple being good woods for the purpose—and should be fastened down by means of through bolts countersunk, or by wood screws, put through from beneath. This should be not less than $2\frac{1}{2}$ in. in thickness, and should be as wide as possible. The remainder of the top may be $1\frac{1}{2}$ to $1\frac{3}{4}$ in. in thickness, but the heavier the structure in all respects, the greater the degree of satisfaction granted to the user. A facing board should be run along the front of the top, the edge plank overhanging it by at least two inches, and a couple of drawers, heavily made, and conveniently placed, should be let into it.

Another absolute essential in addition to the bench is a good vice, which should be of ample size, and preferably of the swivel type, which permits of considerable latitude of use. It should be mounted near one end of the bench and directly over one of the uprights, where it will best withstand the shocks to which it must be subjected. It is essential that the location of the bench, and especially the vice, should be such that ample light is available at all times, and there should be plenty of room all around the vice for the handling of large parts upon occasion.

As to the tool equipment itself, as has been said, it is largely optional with the owner; it may range anywhere from the furnishing of a miniature machine shop, including a small lathe, which is very useful, and small upright drilling machine, down to the most trivial addition to the regular touring equipment furnished with a car. In selecting a tool equipment the chief thing to be considered is that the tools which make it up shall be substantial and adequate to easily cope with the work to be done. Nothing is more trying to the patience and wasting of strength than an attempt to work with tools which are not fitted for the task on hand. Considering, then, the essentials for ordinary repair work, a fairly complete set of bench tools will be found useful at all

The Lorraine-Dietrich six-wheel Petrol Wagon which took part in the recent Military Manœuvres in France.

times. These may comprise a half dozen files, ranging from a heavy bastard down to a heavy smooth cut, of various lengths, and including the round and half-round types, and a warding file for cleaning the contact points of tremblers, &c.; a couple of wrenches, one large enough to take the heaviest nut on a car, which usually is the hub cap, and the other an ordinary bicycle wrench; a heavy machinist's hammer, and a light babbitt or copper hammer, the latter for driving finished parts without injury; a breast drill, together with a set of drills ranging, say, from 1-32 in. to 1-4 in., by thirty-seconds, and from 1-4 to 1-2, or the largest size which the drill chuck will hold, ranging by sixteenths; a small wrench capable of handling round pieces; a hack saw, a pair of 8 or 16 in. gas pliers, and a pair of screw-drivers, one large and one small, to say nothing of a set of socket wrenches. In addition to these, a blow torch, together with a soldering iron and stock of hard and soft solder, will be found almost indispensable, while a good combination volt-ammeter, of the bench type, will soon pay for itself. If heavy parts are to be handled to any extent, or if much overhauling is to be done, a portable crane, or a differential hoist well placed, will be found a great labour saver. It is possible to purchase certain combination tools, and complete sets of tools ready made, some of which are most alluring, owing to their completeness and compactness.

It is always desirable to have on hand, ready for service when needed, a substantial tyre repair outfit, consisting of jacks, levers, &c., and cement and patches in liberal quantities. In making repairs of this nature a small vulcanizing outfit will be found to lend permanency to the finished job.

With all the tools, as with the other portions of the equipment, provision should be made for a neat and orderly arrangement, which shall combine convenience and security to the articles themselves, and economize space, yet without sacrificing anything to efficient

working. By the judicious use of shelves, drawers, and racks on the walls, however, this can be accomplished to such advantage, that from a spare tyre stowed away in its box or bag, down to the very last grain of valve grit or emery powder, nothing shall be mislaid or injured, and any work which is to be done can be carried on to the best possible advantage, even in comparatively unpretentious quarters.

COMPANY NEWS.

NORBURY.—£10,000. Dealers in and agents for motor-cars, wagons, &c. No initial public issue. First directors: Messrs. F. J. Norbury, S. Norris and R. Hilditch. 19, Cooper Street, Manchester.

ANGLO-ITALIAN AUTOMOBILE SYNDICATE.—£10,000. To carry on the business of agents for motor vehicles, and to adopt an agreement with Mr. G. A. Reid and others. No initial public issue.

BRUHN'S TAXAMETER.—£1,000 (£1). As title. No initial public issue. Registered without articles.

BRAMPTON BROS., LTD.—At the general meeting of Messrs. Brampton Bros., Ltd., to be held on the 16th inst., the directors' report will be presented. The profit and loss account shows a profit brought from trading account of £15,931, and after making allowance for depreciation, &c., the available balance is £12,287, from which the usual 6 per cent. dividend will be recommended on the preference shares and a dividend of 5 per cent. on the ordinary shares.

CAPE CART HOOD COMPANY.—£1,000. To take over from Mr. A. McCurd the business of a manufacturer of and dealer in Cape cart hoods, glass wind screens, and other screening devices for motor-cars carried on by him as the Cape Cart Hood Company, together with the lease of the premises in the rear of 3, Willow-Walk, Kentish Town, N.W. No initial public issue. Registered without articles.

SUNBEAM MOTOR CAR COMPANY.—In their report for the year ended August 31st the directors propose a further dividend of $7\frac{1}{2}$ per cent., making 10 per cent. for the year, to write off the whole of the goodwill of £2,000, and to place £2,000 to reserve, making it £4,500, carrying forward £1,315.

ARGYLLS (MIDLANDS).—£10,000. To adopt an agreement with Argyll Motors, Ltd., to act as selling agents of that company in Midland counties and elsewhere, &c. No initial public issue. First directors: Messrs. H. Garner (chairman and managing director), E. H. Watson, and W. A. Smith. 24, New Street, Birmingham.

SOUTHSEA AUTOMOBILE COMPANY.—£2,500. To adopt an agreement with Mr. G. Vereker for sale to company of Granada Motor Company, Limited, recently purchased by him. No initial public issue. First directors: Messrs. H. G. Vereker, G. H. Cox, and E. B. Cornford. One hundred shares.

SIMMS MANUFACTURING COMPANY.—£60,000. To acquire the business of the Simms Manufacturing Company, Ltd., in connection with motors, motor vehicles and accessories, magnetos, and the like, &c. No initial public issue. First directors: Messrs. F. R. Simms, H. J. Donkin, and J. W. P. Peters.

ROAD REPORTS.

BEXHILL.—A question of importance has been argued before the county magistrates at Bexhill, relating to the proposal to make up De La Warr Road and Dorset Road, Bexhill, under the Private Street Works Improvements Act, with tar macadam. Mr. T. E. Rodgers, Town Clerk, explained that it was proposed to make up 1,332 yards of road, and Mr. Willett represented only 423 yards. The cost of tar macadam would be only slightly heavier than ordinary macadam. Mr. George Ball, Borough Surveyor, said the difference in cost between a foot run on the road in macadam and tar macadam was as 7s. 6d. to 8s. 8d., and the latter material would save much expense in scavenging, &c. The Chairman (Mr. E. E. Hurst) said the magistrates had agreed that the apportionment should be reduced by the cost of tar macadam above the cost of ordinary macadam. The case was adjourned for the Surveyor to bring up an amended apportionment.

NORTH BERWICK.—At a meeting of North Berwick Town Council Provost McIntyre moved that the Council make a request to the Secretary for Scotland for the restriction of the speed of motor-cars within the burgh to the rate of ten miles per hour. The caution post erected, had, the Provost said, frequently been entirely ignored. It was agreed to request the ten miles restriction.

THE GREAT NORTH ROAD.—The Great North Road runs through the areas of no less than seventy-two highway authorities, of which number forty-six are actually engaged in its maintenance, but all the seventy-two have some share in its administration.

WORCESTER.—The roads around Worcester have been in splendid condition for motoring. The steam roller is working towards the city. The road from Droitwich to Worcester is uneven, but the main road from Hartlebury to Worcester has improved.

AYRSHIRE.—The state of the roads in the county has been engaging the attention of the Ayrshire County Council, the convener stating that he was under the impression that most of the roads were in good condition, but he confessed that a ride over them in a motor-car had altered his opinion. It was a matter for the District Committee to take up, and if they could see their way to improve the roads he thought it would do a great deal of good to the district.

WORK is approaching completion on a large extension to the works of Messrs. Clement Talbot, Ltd., at Notting Hill, W.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING SPEED LIMIT.

For driving motor-cars on the Nairn and Inverness public road beyond the speed limit three different charges were heard before Hon. Sheriff-Substitute Lightbody in Nairn Sheriff Court. Thomas Bischoff, Ditton Hill, Surrey, at present residing at Loch Coruisk House, Nairn, pleaded guilty to driving at the rate of thirty-one miles per hour. Charles Lumsden, chauffeur to Mr. Grace, of Battle Abbey, Sussex, at present at Dalcross Castle, Inverness-shire, pleaded guilty to driving at the rate of thirty-seven miles per hour. Each was fined £5 or one month in prison. In absence, Arthur Nicholson Stuart, of Harrow, lately residing at Golf View Hotel, Nairn, was found guilty of driving at the rate of twenty-nine miles, and was sentenced to pay a fine of £5, or one month's imprisonment.

EXCEEDING LEGAL LIMIT.

Before Sheriff Begg, at Aberdeen, Ralph Eglin, of Oldham, has been charged with having driven a motor car at a greater speed than twenty miles an hour on the 11th ult., on the north Deeside road, between Mannofield and Culter. Detective-Inspector William Smith stated that on the date libelled, acting on instructions from the chief constable, he went to the north Deeside road to take observations as to the rate of speed at which motor-cars were being driven, and the accused's car was travelling at a speed exceeding twenty miles an hour. The Sheriff found the charge proven, and characterised the case as an extremely bad one, because the car had to pass through two villages at which there were rather dangerous curves. If the car was being driven at excessive speed in order to advertise the possibilities of the car, that was no excuse. He thought the full penalty ought to be inflicted, namely, £10, with the alternative of sixty days' imprisonment.

FURIOUS DRIVING.

At the Leeds City Police court, Frederick Clarke, of Belfast, was summoned for furiously driving a motor-car. The evidence showed that on July 14 the defendant was driving a car along the Harrogate Road at Moortown, and he was timed over a measured distance of 220 yards. The speed attained by the car worked out at 40 miles 1,600 yards per hour. In reply to the Stipendiary Magistrate (Mr. C. M. Atkinson), Mr. Arthur Willey, who defended, stated that that speed was a record as far as the Leeds police were concerned. His Worship stated that under ordinary circumstances he would have imposed a fine of £7 and costs, but as the defendant had volunteered to come over from Belfast, and as he had to pay his expenses, he would only fine him £5 and costs.

The Mayor of Newport (Councillor Frederick Phillips) answered two summonses returnable against him at the Newport County Police Court. The summonses were literally for "driving a certain motor-car recklessly on August 15th at St. Mellon's," and for "driving a certain motor-car in a manner which was dangerous, having regard to all the circumstances of the case," at that time. After hearing the evidence, Mr. Moore, for the defence, contended that there was no case to answer, and the bench, after retirement, concurred, and dismissed the case. The second summons was withdrawn.

At Birkdale, Benjamin Maddox, a motorist, was summoned for driving a motor-car at a speed dangerous to the public over a dangerous piece of road known as Oxford Crossing, at Birkdale. The defendant was fined £2 and costs. When the case had been disposed of Inspector Foster stated that the Birkdale Urban District Council had received a petition from gentlemen residing in Lulworth Road and Westcliffe Road respecting excessive speed of motor-cars. The Urban Council had in consequence petitioned the police, and it was hoped that after that case the ground of complaint would be removed.

REAR LIGHTS.

At the Handsworth Police Court, William Roberts was charged with driving a motor-car in Soho Road without a rear light. Defendant said he was certain the lamp was alight a few minutes before he met the police officer. The chairman (Col. Wilkinson) said that as a motorist he sympathised with the defendant. He knew from personal experience how difficult it was to keep the rear lamp burning, but at the same time the law required that a light must be shown at the back of the car. Defendant would not be fined, or his licence endorsed, but he would have to pay the costs, 5s.

A DISMISSAL.

At the Buckrose (East Riding) Sessions at Norton, on Saturday, fifteen motorists were charged with driving beyond the speed limit and other offences, the large capture being the result of a trap set by the police on the main road running between York and Scarborough, near Malton. The case to which most interest attached was that of David Stoner Crowther, of Rooklyn, Huddersfield, against whom two charges were preferred—of driving beyond the regulation speed, viz., at thirty-one miles, sixty-one yards per hour, and of driving to the danger of the public. Mr. C. Fowenthall, barrister, who appeared for the defendant, asked that the charges should be taken separately, which was done. After the police had stated that the offence was committed on a dangerous part of the road known as Potter Brompton, where three roads meet, and had admitted that there was no traffic on or near the road at the time, the barrister urged that there could be no conviction because nobody had been endangered. He pointed out that the section of the Act required the circumstances with regard to traffic, &c., to be taken into consideration.

The Bench dismissed the charge on the ground that there was no evidence of the defendant having driven to the danger of the public.

In the second case, for exceeding the speed limit, the defendant did not deny what the police had stated, that he had gone over thirty-one miles an hour, but the barrister raised the point of law that the defendant having been tried on one case in which the facts and the circumstances were the same, and having been acquitted, he could not be convicted on the second charge. The Bench said they dismissed the case on the point of law only.

After this decision the superintendent of police withdrew the charge of driving to the danger of the public against all the other defendants, but thirteen of them were fined for exceeding the speed limit.

"TRAP" OR "MEASURED DISTANCE."

At Lancaster, on Saturday, Mr. William Robley, Blackburn Road, Accrington, was summoned for exceeding the speed limit at Ellel. Sergeant Summerfield, speaking of the measured distance of a quarter of a mile on the Garstang road (which he said the defendant covered at the rate of twenty-five miles an hour), referred to it as "the trap." He was told by the Chairman (Mr. E. Barton, Carnforth) not to say "the trap," but "the measured distance." A letter was read from Mr. F. W. Ogden, solicitor, Manchester, an occupant of the car, to the effect that Mr. Robley was driving carefully and at a reasonable speed all the way, that there was no idea of and no need for scorching, as they had plenty of time, and that if the speed limit of twenty miles an hour had been exceeded it could only have been momentarily. A fine of £2 10s. and costs was inflicted.

MOTOR DAY AT ARUNDEL.

On Monday, at the Arundel Borough Bench, four motorists were fined £15 10s. and costs.

Before the County Bench seven motorists were summoned and all fined, the aggregate gain to the county being £31 and costs.

Touring in Germany.—A Halt en Route.

From a Sketch]

HEAVY HAULS.

Reports from many of the courts show that heavy hauls of motorists have lately added to the revenue at the Bearsted (Kent) Petty Sessions, and the courts at Grantham, Christchurch, Malton (Yorkshire), Ripon, and Carlisle.

SUPERINTENDENT MARKS AGAIN.

ON the 3rd inst., at King-ton Petty Sessions, a summons was gone into by which Mr. E. G. Drabble was alleged to have driven at a speed dangerous to the public on the Hershaw road at Walton between the "Barley Mow" and Mole House. Mr. T. W. Staples Firth defended. Inspector Marks gave evidence that on September 10th he was standing in the gateway of Mole House looking over the wall when a motor-car came into his view round the corner 70 yards away. When he first saw it it was travelling at thirty-five miles an hour. The road itself was a very dangerous one, having three very sharp turns within a distance of under 200 yards, and two market garden carts had just passed out of his view, going in the opposite direction to the car. After hearing some witnesses for the defence, the Bench intimated that the evidence for the prosecution was very unsatisfactory and dismissed the summons.

FROM Messrs. Rubery, Owen and Co., of Darlaston, we have received a copy of their new catalogue of motor vehicle frames, which are made both of hydraulically pressed and rolled channel steel. The firm was one of the first to take up this branch of the industry, and the new list has been compiled with a view to it being found useful for reference as a standard work, as they now have a large quantity of dies, whereby they are enabled to provide almost any design of frame required. No less than sixteen pages are devoted to illustrations of different designs of frames, but if these do not meet requirements, Messrs. Rubery, Owen and Co. are prepared to make dies to customers' exact needs, or even smith such frames by hand should the quantity needed not justify the expense of dies. Frame-ends, springs, and spring carriers, nuts and bolts, &c., are other specialities of the firm dealt with in the catalogue, copies of which may be had on application.

FORTHCOMING EVENTS.

OCTOBER.

- 12th (S.).—Close of the Commercial Vehicle Trials. Final run from Baldock to Dalston, London, N.
 Southend M.C. closing run of the season to Witham.
 Brooklands A.R.C. meeting.
 Motor Cycling Club members' petrol consumption tests, starting from the Bull, Gerrard's Cross.
- 15th (Tu.).—The "Industrial Motor Review" will be published, with a full report of the Commercial Vehicle Trials.
- 17th (Th.).—Demonstration of Commercial Motor Vehicles in Glasgow, under the direction of the Commercial Vehicles and Industrial Committee of the Scottish A.C.
- 19th (S.).—Auto-Cycle Club's quarterly trial.
- 23rd (W.).—Annual dinner of the South Devon A.C. at the Royal Hotel, Plymouth.
- 26th (S.).—Scottish A.C.'s hill climb near Fintry, Stirlingshire.

NOVEMBER.

- 11th (M.).—Opening of Olympia Exhibition.
- 13th (W.).—Annual Dinner of the Motor Union.
- 22nd (F.).—Stanley Show.
- 30th (S.).—Annual dinner of the North London A.C. at the Midland Grand Hotel, London.

DECEMBER.

- 7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.
- 18th (M.).—General Committee of the Motor Union.

MARCH, 1908.

- 21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

PUBLIC MOTOR SERVICES.

IN returning a verdict recently in the case of a fatal accident at Bournemouth, the jury have recommended that all mechanically propelled vehicles plying for hire in the town should first be examined by a fully qualified motor engineer.

THE Coroner's inquiry into the circumstances of the motor-car-a-banc smash at Moscar, near Sheffield, on August 25th has been concluded. Albert Frudd gave evidence that the car got into the gutter in endeavouring to pass a carriage travelling in the same direction, and crashed at a speed of ten miles an hour into the telegraph pole. The jury, after deliberating for forty minutes, returned a verdict that the four persons fatally injured met their deaths through an accident. They added an expression of opinion that in future all intended drivers of public motor-cars should be conversant with the district before driving.

THE seventeenth volume of London Statistics just issued by the L.C.C. gives the number of motor-buses in London at 783 and of horse omnibuses, at 2,964.

AFTER being the subject of numerous complaints, motor-omnibuses have ceased to run in Birmingham. The last service was withdrawn on Saturday.

THE Hagley Road motor omnibuses have been taken from the road as the result of pressure brought to bear on their owners by the Birmingham Watch Committee. We understand that the Birmingham and Midland Motor Omnibus Company have arranged to replace them by a service of horse 'buses.

POLICE TRAPS.

WE hear of several traps having been successfully worked by police operators within the borough of Godalming.

MOTORISTS going near the Menai Bridge should beware of police traps on the various cross roads in that locality.

THE trap at Kingston, between Carlisle and Glasgow, is again in active service.

ON the Arundel road at Durrington is a motor trap.

THE village of Raglan has its police trap—a measured distance of 354 yards.

IN the Charlton Road, Charlton, the police are now timing motorists.

THERE is a police-trap in Kingston Road, Ham.

SEVERAL police traps have lately been set in some of the roads about Walton-on-Thames.

THE police are often watchful at the Muddleswood cross-roads, near Haywards Heath.

BROMLEY Common has become a favourite trapping ground with the police. These are generally in operation on Sunday afternoons.

ELECTRIC timing arrangements have been introduced into Yorkshire, being used in connection with the traps on the Scarborough road, notably at Potter Brompton.

CLAIM AGAINST MOTORIST.

AT the County Court, last week, before His Honor Judge Tindall Atkinson, Ernest Broyd sued Preston Cooper, motor engineer, Halstead, for £3 damages for negligence in driving a motor-car, whereby he ran over a black spaniel dog.—Plaintiff stated that the driver of the car, after running over the dog, did not stop. The car was travelling at a rate of about eighteen to twenty miles an hour.—Defendant maintained that the dog rushed in the way of the car, and that he was not going above fourteen miles an hour.—His Honor found for the plaintiff, and awarded £3 damages and costs.

OBSTRUCTING A MOTORIST.

A SUMMONS was brought by Mr. W. A. Calvert, J.P., of Broomells, Capel, at the Dorking Petty Sessions, against Percy Goddard, of Isleworth, for obstructing the highway at Capel on September 14th by neglecting to keep the horse and van which he was driving on his left or near side of the road. Complainant said that he was being driven in his motor-car. At Hoyle Hill, near Beare Green, he overtook a furniture van. There was a man lying on the top of the van, just behind the driver, watching the car. As the van was not on the proper side of the road witness's chauffeur sounded the horn. The man on the top of the van looked back twice, but the van did not move on to the proper side and there was no room for the car to pass. Defendant, who now said he did not hear the horn, was fined 10s. including costs.

AUTOMOBILE ACCIDENT.

A SERIOUS motor-omnibus accident occurred on Saturday afternoon at Liberton Brae, near Edinburgh. The omnibus, which had a full complement of passengers both inside and out, was going downhill when it swerved to one side and overturned. Twelve of the passengers received injuries of a more or less severe nature, while five persons were so seriously injured that it was found necessary to remove them for treatment at the Royal Infirmary.

BUSINESS NEWS.

THE "Ever Ready" automatic engine starting device illustrated elsewhere in the present issue is made by the Auto Improvement Company, of 316, Hudson Street, New York.

FROM Mr. John Roper, of the Gear Works, Dudley Road, Wolverhampton, comes a descriptive list of the bevel and mitre gears he is making suitable for the differential gears of motor-cars.

THE Sheppey Motor Company, of Thomas Street, Lawrence Street, York, have just issued a catalogue of the various specialities they are turning out for steam cars and launches. These include single-acting horizontal four-cylinder engines, double-acting high-speed engines, generator feed pumps, throttle valves, regulating valves, feed water heaters, relief valves, &c., all designed for use in connection with superheated steam.

MR. HUNTLEY WALKER has retired from his position as managing director of Messrs. Huntley Walker and Company, and the name of the firm will in future be the "Times' System" Automobile Company, Ltd., with Mr. Chas. Gulliver as managing director.

THE proprietors of the National Motor Academy and Exchange, Ltd., wish it to be made clear that they are not, and never were, in any way connected with "The Academy of Motoring." They have in the last month made considerable extension of their premises in Boundary Road, Notting Hill, W., renovated the whole of the class-rooms, made material extensions and additions to the equipment of their workshops, and have raised the "stud" of instruction cars to seven, of which no less than five have modern four-cylinder engines.

THE Vulcan Electrical Speed Indicator, of which many thousands are now in use, has been recently considerably improved, the result being to render the instrument still more independent of skilled attention and care. As is already well known, the instrument consists of a small electro-magnet of some four to five inches in length, having a rotating iron armature, there being no moving coils, wires or commutator. This is connected by a flexible wire to an indicating dial, which is a small hot wire voltmeter, entirely dead-beat and yet immediately responsive to variations in the speed. In the older type, the bearings of the magneto were quite plain and required rebrushing from time to time as well as greasing. If this was not done, inaccuracy sometimes appeared after considerable use. In the new pattern which Messrs. Geipel and Lange are now sending out, the bearings have been redesigned and the highest class steel cone adjusting ball-bearings are fitted. These are filled by the makers with sufficient lubricating grease to last many thousands of miles, and may reasonably be expected to wear considerably better than in the older pattern. Messrs. Geipel and Lange also inform us that they are now prepared to supply a recording speed indicator which can be fitted to the dashboard of a car and, while indicating at any moment the speed at which the car is travelling, will record on a chart, clearly in view of the driver, the speed at any moment. At the end of the run, therefore, the chart can be removed from the instrument, and a view taken of the whole day's running. The mechanism is extremely substantial and reliable; it can be set to give a record 1 in. long in twenty-four hours, or, if required, an arrangement can be made to give a record of 1 in. per hour.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, OCTOBER 19, 1907.

[No. 450.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

IT was a frequent cry of the opponents of railways in the early days of the last century that the coming of the locomotive would lead to the extinction of horses. Something of the same kind has been heard with regard to the motor-car, but more enlightened public opinion has convinced even the most rabid opponents of mechanical traction that it is not desired to oust any particular form of locomotion but to do the best that is possible for the country. This fact is apparently recognised by veterinary surgeons, for Professor G. D. Lander, at the opening of the winter session of the Royal Veterinary College, pointed out that the power of the motor-car as a source of injury to their profession in general had been considerably overstated, and that, apart from the horse practice, there were other established and prospective avenues open before them. There still remained the farm and other domesticated animals, and he urged veterinary surgeons to extend their work in that direction. This is certainly a reasonable attitude to assume, for, whilst the automobile may displace activities in certain directions, these will find avenues for employment if diverted into other ways.

Motor-Cars in Barracks.

THE following instructions have been issued officially for the information and guidance of all in possession of motor-cars for which storage accommodation is provided in barracks. A copy of these instructions is to be placed in a conspicuous position in every petrol store or where any motor-car, public or private, is housed in barracks:—Smoking strictly prohibited; no matches or light of any sort to be brought into this store under any pretext whatever. Petrol tanks must be filled in daylight, and at a distance of not less than ten yards from this store; petrol taps and petrol tank covers must be kept closed while in this store. Examine carefully daily for leaks of every sort, especially at junction of petrol feed pipe; do not flood carburettor in store. Engine never to be left running in the vicinity of the store unattended. Spark not to be left on, nor spark tested while in store. No empty or partly empty tins to be kept in the store, nor any tins that have been opened, nor any leaky tin. Not more than three tins of petrol to be kept in this store, and the seals of these must not have been broken. A box of dry sand of not less than five gallons capacity to be kept in the store to extinguish fire; water is never to be used where petrol is concerned. No paraffin or other mineral oil (petrol excepted) is to be placed in this store. Cars are not to be run into this store by their own power; they must be run in by hand.

Automobile Instruction.

IN connection with the Polytechnic motor-car body and carriage building schools at Balderton Street, Oxford Street, London, W., which we recently referred to, a Day School has been established, intended for the use of the sons of coach makers and others. Special arrangements have been made for those who can only spare two or three afternoons a week, thus including the practical work with the technical training so essential to the young man entering upon the business of motor-car body or carriage building. We are glad to learn that opportunities for combining practical and theoretical instruction are growing both with regard to engineering and carriage work. Doubtless the time is coming when it will be generally recognised that a few hours spent each week in a technical school will be an advantage to the young fellows engaged in such industries as those associated with the automobile, in whatever department they may be. Private enterprise, such as the National Motor Academy, has provided ample opportunities with regard to the engineering section, and it is gratifying to learn that the carriage work is not being overlooked.

Trimming Hedges.

THIS is the time of year when owners of land in the country, as well as residents in the suburbs of large towns, are trimming their hedges and lopping their trees. We trust that in doing so occupiers and owners of property will take care that all cuttings and trimmings are immediately removed from the road, so that users of the highways, including motorists, will not be inconvenienced. In Andover the Rural Council is advertising in the local papers calling attention to the high hedges at the cross roads, and appealing to occupiers to keep those adjoining the same as low as possible. Although, of course, there is no legal obligation for owners to observe such a request, a general response to the suggestion conveyed would add considerably to the safety of the road. If the local authorities throughout the country would systematically indicate, through their surveyors, where hedges could usefully be lowered and the way made clear for advancing traffic, it would be a national advantage.

Caution in Court.

AN interesting incident occurred recently at a Stipendiary Magistrate's Court. A motorist had been charged with driving to the common danger, and the magistrate, in his summing up of the case, expressed an opinion that it is very hard on motorists to suddenly find themselves in a dangerous

place, there being no indication that extra caution is necessary, and mentioned several danger spots in the district near which caution boards should be erected. It happened that Colonel Bosworth, Chairman of the Automobile Association, was in court to give evidence in the case, and, addressing the magistrate, he observed that his society was always glad to prevent persons from unconsciously breaking the law, and that he would therefore be happy to erect the signs indicated by his worship. The magistrate asked Colonel Bosworth to convey his thanks, on behalf of the public, to the Automobile Association, and directed the chief inspector to confer then and there with the chairman, the result being that the necessary caution boards will be erected forthwith.

The Popular White.

◆ ◆ ◆
In the Town Carriage Competition in this country, and at many of the leading social events of the United States, the White steam car has proved a fashionable vehicle. When leaving Oyster Bay, at the conclusion of the season, for Washington, President Roosevelt and his wife—seen in the accompanying photograph—left their house for the station by one of the Government's White steam cars. In previous years the departure of the President from the famous resort has taken place by ordinary carriage, but President Roosevelt preferred to make

the journey by automobile instead of horse vehicle. Another distinguished American who has lately shown marked partiality for the White car is Mr. J. D. Rockefeller, who has purchased one of the first 1908 30-h.p. model limousines, after two years' experience with a White car also of the limousine type.

Tramways and Public Safety.

◆ ◆ ◆
CORRESPONDENCE has lately taken place between the Highways Committee of the London County Council and the Motor Union with regard to three ideas of some importance so far as the safety of pedestrians in the streets of the Metropolis is concerned. The result has been to establish three points, to which we give publicity, so that infringements or omission to comply with these may be notified to the authorities. It appears that at busy times of the day officials are placed on duty at the entrance to all the Council's tramway depots to control outward and inward traffic, and to hold these up when cars are about to enter or leave the depots. Then, again, the Council's conductors are instructed to warn passengers of the dangers of passing traffic when they are leaving the cars; while the Highways Committee are now considering what further steps they can take to enforce this warning upon careless members of the public. An important point with regard to the stoppage of tram-cars on the up and down routes when side by side and effectually blocking the road, has also

been raised by the Motor Union, in reply to which the Council said that the stopping places on their tramways are so placed that there shall be a clear distance of about a length of a car between the two vehicles when they are at a standstill on different tracks. Moreover, the police are also taking steps to prevent two tram-cars from stopping alongside one another at busy points of the main routes. This latter is an important point, and when motorists find it is being disregarded they will be acting in the public interest to call the attention of the nearest policeman to the fact.

Motoring on the Great North Road.

◆ ◆ ◆
THE question of furious motor driving on the Great North Road was again brought up at a meeting of the Standing Joint Committee of the Kesteven (Lincolnshire) County Council last week. The Chief-Constable of the county (Capt. Mitchell Innes) said he was doing all he could with his very sparse and widely-spread force to check the nuisance. The police had stopped 124 motor-cars on the road and cautioned them for driving at an excessive speed. He took action in twenty-one cases, which resulted in sixteen convictions; two he withdrew, and three were dismissed. He believed the nuisance had been distinctly diminished, and he had received tremendous support in checking it from everybody who was concerned and interested in decent driving, including motorists and motor organisations. For the slack season he hoped to be able to carry on with the force of police he had available, but when the time came round for him to make arrangements for the busy season he would ask the Committee to appoint a small sub-committee before whom he could lay his complaints and his suggestions with regard to obtaining extra police. Without more police assistance he could do nothing. In the course of a discussion which followed it was stated that damage had been done to the Great North Road by quick-travelling motor-cars, during the past six months, amounting to £1,000. The Committee ultimately decided to endorse any action the Chief Constable thought fit to take in the matter.

The Licenses of Drivers.

◆ ◆ ◆
"LEAVE nothing to chance" is an old proverb not without its application to the modern motor-car. A Kingston merchant has been summoned for employing a chauffeur who was not licensed to drive. The driver, of course, was also summoned for being in charge of a car without having the necessary permission. On behalf of the motorist it was explained that he was not aware that the Motor Car Act made it incumbent on him to see that the driver was properly licensed. He knows now. In this particular case the chauffeur had had a licence but it had expired; hence the delinquency. Owners of cars cannot be too careful in such matters as the registration of their vehicles and licensing of their drivers—acts for which they are legally responsible.

The Grievances of Motorists.

◆ ◆ ◆
A LETTER in the correspondence columns of the *Times*, from Mr. W. M. Acworth, is an interesting testimony to the fact that prejudice against automobiles is parochial and isolated. He has been touring on Exmoor and Dartmoor, and has come to the conclusion that there is no such general deep-seated hostility to motor-cars as is sometimes suggested by opponents. When he passes a dozen carters in succession in a Devonshire lane, and every one of them draws his cart in to the bank and stops to let him get by without difficulty, "I cannot think that he does it with hatred in his heart, in dread that my motor will damage his cart. And when to my 'thank you' he replies with a cheery smile, I am convinced that the pleasant relations between the classes which always have existed in country districts have not been upset by the advent of motors. What hostility there is to be found among the population near London and on two or three main roads within a hundred miles

er so." Then, too, as Mr. Acworth points out, motorists have grievances of their own. Roads are made to travel on, and it is not fair that, where a proper footpath is provided, a pedestrian should use the road except with the same liability which a driver takes who goes on his wrong side. If road surveyors would appreciate that neither sharp pebbles nor muddy loam are attractive to walk on, possibly pedestrians might sometimes even use a footpath by preference. Again, there are other road-hogs besides motorists, and "beery draymen, droway carriers, careless drovers," and the like, need to be once more educated up to the same standard of wakefulness and activity which they surely must have maintained in the old coaching days.

A Magisterial Warning.

THE Midhurst magistrates on several occasions have hinted to motor defendants coming before them that there was a possibility of severe measures being meted out to them in the near future, and at the last sitting of the Petty Sessions the chairman of the Bench intimated that his brother magistrates have come to the end of their tether so far as

the method of timing adopted by the police. Drivers heard nothing of the matter until two or three days had elapsed, and were therefore unable to prepare a defence. The chairman of the Bench said there was nothing in the Act to exempt medical men, although, personally, he sympathised with them, and wouldn't mind them going 60 miles an hour—he would only be too pleased. And then he proceeded to fine the doctor £3 and costs.

Traps to be Disclosed.

IN the course of a case against a motorist at Croydon on Saturday an interesting piece of information was given by Inspector Chinn. The defending motorist said he asked the constable who stopped him on the Brighton road at Coulsdon where the trap was. The reply of the officer was that he was not allowed to disclose it. And yet it was, as any ordinary person can see, very necessary that the defendant should know where the trap was, in order to check the evidence of the constable. Then the inspector announced that as the result of a case at Edgware the Commissioner of the Metro-

The Poona Motor Trials.—Captain Woods at the wheel of the 30-h.p. Daimler on which he won the Khandalla Ghat Hill Climb.

leniency is concerned. A practical example of this followed when every motorist coming before them was fined £10, these being the heaviest fines that have yet been imposed at Midhurst for offences under the Motor Car Act. Apparently no discretionary power will be recognised, uniformity in heavy fining being the magisterial rule in Midhurst.

Medical Motorists.

CONSIDERABLE sympathy must be felt with the Medical Officer of Health for Loughton, who has been four times before the Justices for speedy driving during the last three years, and only on one occasion, when the case was dismissed, had there been any allegations of reckless or inconsiderate driving. Summoned last week at Ongar, he denied that he was going at 30 miles an hour, because his car was incapable of doing it. On the day in question he attended a patient at Coopersale, and hearing that someone had been seriously injured at a farm fire at Stanford Rivers he hurried forward. If the police continued to pillory him in this way it would make the continuance of his country work almost an impossibility, because there was probably no day upon which he did not go at the rate of 23 or 24 miles an hour on some part of his journey. Further he objected to

politan Police had given orders that the exact location of the measured distance should be shown. This is reasonable—if we allow that there is any reason about a police trap—and it seems scarcely English to have gone on so long without such a regulation being made known to likely victims of police vigilance.

Brooklands.

THE last meet for the season on the Brooklands Track took place on Saturday, when the organisation of the event was admirable in every way. Evidently the inexperience of the earlier events has been an education for the promoters of the track; who have had the weather on their side at each meet they have held. This has been an important factor in the development of track motor racing in this country. On Saturday the highest speed attained was in the only long distance race of the afternoon, Mr. F. R. Fay's 75-h.p. Mercedes averaging 92½ miles per hour. Mr. O. Cüpper, too, was a successful competitor, taking premier honours in the first race, and being second in two others with his Metallurgique cars. The Napier was successful in three events, and won the most exciting event of the day, beating the Iris by six or seven feet only.

SOME NOTES ON HILL CLIMBING.

By LOUIS T. WEISS.

ONE of the great feats that is credited to almost every car by its owner is, "She'll take any hill, within almost any radius, on the top gear." It is certainly necessary for a car to get over any hill on the road, and it is, no doubt, a pleasure to surmount it on top speed; but whether it is advisable to do so is a question answered in some cases immediately by the breaking or straining of one of the parts, or later by the poor condition of all the parts of the mechanism. The most important factor in climbing hills fast certainly is in having sufficient motive power in proportion to the weight of the car which it propels. It does not follow, however, that a high-powered vehicle should climb hills on the top speed as easily as a light car with a good deal less motive or horse-power; first, on account of the difference in weight to be dragged, and mainly on account of the relation of the speed of the motor to the driving wheels.

High-powered cars are generally geared much higher than cars with smaller engines. This is done so as to be able to travel fast on the level without running the motor excessively

between the intervals of the explosion, the vehicle will jerk at each explosion, and all driving and power transmitting parts will be under a strain for which they were really not designed. While they may stand it they will certainly not last as long as they would when carefully used. To impress the importance of this subject and make it clear, let us figure just how far one explosion in one cylinder of a four-cycle, four-cylinder motor, geared at a two to one ratio, must push a car mounted on 34 in. wheels, and at the same time how many revolutions, or at what speed per minute, the motor runs when the car is travelling at a speed of sixty miles per hour.

A mile being 5,280 ft., and the circumference of a 32 in. wheel being approximately 9 ft., it takes about 587 revolutions of the wheel to cover one mile. The motor must then make twice 587 revolutions, or 1,174 revolutions per minute. As in each cylinder there is one explosion to two revolutions of the crankshaft, we get 2,348 impulses on the motor shaft in one mile, which works out at about 2 ft. 3 in. of travel of the car to each explosion.

Now, supposing we negotiate a hill with $33\frac{1}{3}$ per cent. gradient, which means one foot rise in three feet advance. If we ascend it with the car before mentioned, each explosion in the

The Commercial Vehicle Trials.—The Officials receiving the cars at Baldoak.

fast. The average relation of gearing is about three to one on the top speed on cars of from 20-h.p. to 25-h.p. In cars of from 30-h.p. to 45-h.p. the average gear is about two and one-half to one. Still higher powered cars, say from 50-h.p. to 60-h.p., have a ratio which is often less than two to one. These ratios are spoken of as the average, but there are many high-powered cars with lower gear ratios when built for special uses.

When, for example, the ratio three to one is spoken of, it means that the engine shaft turns three times in order to turn the driving road wheel once. When figuring the ratio or the speed of the motor when travelling a certain mileage per hour it is necessary to consider the size of the driving wheels, because when a car mounted on 34 in. wheels has a ratio of three to one, its engine runs slower than one of a car mounted on 32 in. drivers with a three to one gear, both making the same speed.

Consider now what the ratio of gearing has to do with the hill-climbing abilities of motor-cars. The explosions in the cylinders behind the pistons are really pushing the car up the hill. When the motor is allowed to run fast while the car goes slow, the explosions occur often, the fly-wheel will keep up a continuous, uniform speed, and the car will mount easily and without jerking. When, however, the motor runs slowly, the fly-wheel not being heavy enough to advance the car steadily

small cylinder of perhaps $4\frac{1}{2}$ in. to 5 in. in diameter, and on a crank of $2\frac{1}{2}$ in. to $2\frac{3}{4}$ in. length, must push the car with all its weight, and against all the friction, 2 ft. and 3 in. ahead, and consequently raise it one-third of that distance, which is 9 in. Consider what a tremendous strain there must be on all power transmitting parts, especially when going slowly, for then the fly-wheel at the speed it turns is not heavy enough to carry the car steadily ahead and upward. On this account it is advisable to climb hills on the lower speeds.

THE Star Engineering Company, of Wolverhampton, have sent us a photograph of a new motor-cab which they are now supplying for private and public use. The vehicle is not designed to suit the London regulations, but modifications are being introduced whereby the Star Company can construct the cab to meet the requirements of the Scotland Yard authorities. The vehicle is fitted with a 12-h.p. four-cylinder engine, $3\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke, the ignition being by magneto. The change-speed gear gives three speeds forward and a reverse, the transmission being by two side chains to the rear road wheels. A roomy body, giving comfortable accommodation for two persons, is provided, as also is an extra lift-up seat for a third passenger.

A FORTNIGHT'S TOUR IN HOLLAND AND GERMANY.

BY R. M. WRIGHT.

IN a fortnight's motor tour in Holland and Germany I have covered a distance of 2,300 kilometres, and had opportunities of sampling various roads in different parts of the Continent, and my experience may be of assistance to others who may contemplate visiting Holland and Germany by motor-car. I left Lincoln on Saturday, August 31st, on a 12-14-h.p. Argyll fitted with hood and screen and every other accessory to make such a tour a success. The first part of the journey was to Harwich *via* Ipswich, at which latter place the night was spent. The following day through Felixstowe to Harwich, and on board the Great Eastern steamer "Dresden" for the Hook of Holland. At this point I was joined by two friends, who accompanied me on the trip. The Hook was reached at 5 a.m. on Monday morning, and, the car safely landed, we made straight for Rotterdam, that town being reached after a very rough journey over the vilest roads it had ever been my experience to drive. The roads were very narrow, and paving stones of very large dimensions constituted the surface. This journey took us an hour and a half. After light refreshment we made our way to Utrecht, where we arrived for lunch. During this distance the roads were very bad, with the continuance of paving stones. After lunch, we continued the remainder of the day's trip to Arnheim, where we arrived at 5 p.m., just prior to a heavy thunderstorm. Arnheim is a town of picturesque dimensions, and is a typical Dutch centre.

Leaving Arnheim on the following day at 8.30, we made for the German frontier, a distance of some sixteen miles, where we got our Dutch money back as duty paid on the car at the Hook, but had to pay it out again to the German Customs some 200 yards further ahead. Here we got on some good road, and, making our way to Cologne, we had a lovely spin, the only interruption during this trip being one puncture. The condition of the road during the day was much appreciated after the previous experience, and we anticipated that if the remainder of our trip was to continue with such good roads, we would not think too much of the bad condition of those in South Holland; but our experience the next day, on leaving Cologne for Frankfort up the Rhine, was not equal to the previous one. Still, we could not term the roads bad; they were moderate. The scenery up the Rhine from Cologne to Frankfort was quite equal to all that has been said of it, what with the beautiful river and the mountains on each side.

We arrived at Frankfort at 7.50, having made a good trip. The town is a magnificent spectacle of beautiful buildings, wide streets, and very clean delightful suburbs, and we would compare it really to Edinburgh, with the exception that it is not hilly, and the buildings are of a richer character. Leaving Frankfort at mid-day on the Thursday we made for Heidelberg, the beautiful University town, and on to Karlsruhe, where we put up for the night. The following morning we left Karlsruhe for Kippenheim, a distance of seventy miles, which was the home of one of the occupants of the car, and, after taking dinner at the residence of a family in that small village, where we received a hospitable welcome, we journeyed to Baden-Baden, possibly the most fashionable spa watering-place in the whole of

Germany, arriving at five o'clock. At this place I had decided to stay for two or three days, and visit the various interesting places round about with the car, which up to this point had not given the slightest trouble. During my stay at Baden-Baden, which is one of the most lovely spots it has been my lot to see, I visited most of the pretty and interesting places in the neighbourhood, each day finding myself amidst charming scenery with fine old castles situated on mountains, thickly wooded, and approached by long avenues of trees.

On Wednesday, at three o'clock, I and my friends bade adieu to lovely Baden and made our way to Mannheim, there to visit some friends and the large exhibition open at that place. This we found a very large open show like Earl's Court, splendidly illuminated, with all sorts of amusements going on, and was well worth a visit. The next morning, after a most beautiful run to Mainz, where we took lunch, we went along the

Rhine to Cologne, which was the finest run of the tour, the weather being excellent and the scenery charming. We arrived at 6 o'clock, and, putting up at the Du-Nord Hotel, made arrangements to make an early start next morning, as we had a long journey before us, and the usual order of Customs to encounter before reaching Amsterdam, where we wished to arrive in daylight. This was satisfactorily accomplished after a very interesting run *via* Zanton, Beck, Arnheim, Utrecht, the distance, 172 miles, being completed by 5.30 o'clock.

Saturday being the last day on the Continent, we spent the morning seeing the sights of Amsterdam, and afterwards ran to Scheveningen, the famous Dutch watering place on the North Sea, near the Hague. Continuing our journey to the Hook of Holland we made all arrangements to get the car on board the "Dresden," the same boat that we went over on. After the usual order of Customs and getting our duty money back, the car safely landed on the boat, and everything done, we put ourselves up for the night, and before the boat left the quay we were fast asleep and nothing

more troubled us until our call next morning at 5.30 o'clock.

At Harwich, after breakfast on the boat, and seeing my friend off to London by train, I got the Argyll ready for my journey to Lincoln, where I had wired to say I should be home for lunch. Starting punctually at 8 o'clock and making my way towards Mannington, Bury St. Edmunds, Downham Market, Wisbech, Long Sutton, Holbeach, Sleaford, I arrived home at 2 o'clock, a distance of 147 miles, non-stop. This, I consider, was a very good finish, the little car behaving in a manner that does credit to the firm who made it, it having covered 1,500 miles in all in a fortnight, and for the most part over terrible roads. I had not even to touch a sparking plug during the whole journey. The petrol consumption averaged 22 miles for the gallon, which is not bad for a four-cylinder car.

There are a few points I should like to mention which may be of interest to other motorists taking a similar tour. The slow vehicular traffic is drawn by oxen, which are very stupid, and mostly on their wrong side of the road, and the drivers are nearly always asleep. The lights at night on all heavy slow-moving carts are carried underneath the vehicle at the back of

Mr. R. M. Wright at the wheel of the 12-14-h.p. Argyll on which he recently made a tour in Holland and Germany. Seated at his side is Mr. W. Lilly, the new Sheriff of the City of Lincoln.

The photograph from which the above illustration is reproduced was taken at Newport Arch, Lincoln—the oldest Roman arch in the country.

the horses and oxen, which is very misleading. The roads in Holland are all brick paved, some very badly indeed, and quick travelling is not conducive to comfort. The German roads are very indifferent, and for the most part very bad, nothing like the roads we have in England, and the worst feature is the cobble stones in the small towns and villages, which are terrible. The deep "grips" which run across the streets are most dangerous, being very liable to break the frame springs and axles. The railway lines are most numerous, and have to be crossed many times during a day's run in most districts. The warning signs such as "Drive slowly" and "Automobiles 15 kilometres," &c., are very numerous, and this I consider a step in the right direction, and should be more liberally done in the villages and main roads in this country, for there would then be less complaints than we have at present.

Taking the trip as a whole, it was one that I can thoroughly recommend to motorists, or even non-motorists, as they can hire cars at a reasonable price, and get a holiday that cannot be equalled in this country. I would advise intending tourists, however, to take a good whip with them, to keep the boys from

TO THE ISLE OF WIGHT.

MOTORISTS are not content with the exploration of the roads and bye-ways of their own countries; and British tourists are no exception. They are often found wandering in islands adjacent to Great Britain. This year some crossed to the Emerald Isle to follow the Reliability Trial there; others ventured to Douglas and attempted enthusiasm in connection with tourist trophies. Profiting by the experience of recent seasons, many journeyed southward and revelled in the delights of the Isle of Wight. The advantage of such a trip is that the whole island can be finished in one attempt, and the visitors become quickly familiar with all its charms.

How to reach this favoured spot—separated from the mainland and unreachable by motor-car. The London and South Western Railway Company has two routes to suggest; that via Lymington has found advocates among a large number of motorists since the facilities for dealing with cars at that place have been made generally known through our columns and elsewhere.

A Motor-Car Landing from the Ferry at Lymington.

sitting on the back wings and hanging on to the hood behind the car, as they have a strong weakness for this kind of thing.

At a recent meeting of the Long Island Automobile Club (U.S.A.), an interesting paper was read by Mr. Louis T. Weiss on the subject of "Hill Climbing," an abstract of which is given elsewhere in the present issue.

THE Industrial Motor Company, of Windsor, have just completed a 1-ton van for Mr. Harry D. Sillito, of Golden Hill. The vehicle is the first of three which it is intended to use for the delivery of bread between the central bakery and Mr. Sillito's various shops and stores. The motive power is supplied by a 12-h.p. two-cylinder petrol engine.

THE Empress Motor Company, of Stockport Road, Manchester, have sent us a copy of the catalogue giving a full description of the Empress 14-20-h.p. car. The vehicle is fitted with a four-cylinder engine, and, while following the general lines of live axle machines considerable care appears to have been taken in working out the details. Mr. Frank Smith, the manager of the Empress Company, has lately devised a new automatic carburettor, which we hope to illustrate in an early issue.

Last summer 130 large automobiles went to and from the Island by this route, and a considerable growth in the traffic is officially anticipated in the 1908 season. At Easter this year more than forty motor-cars were taken to the island via Lymington, an experience that persuaded the L. and S. W. Railway Company to treat the Whitsun and August Bank holidays as ordinary weeks, so far as that class of traffic is concerned.

In addition to the favoured Lymington route, the joint South Western and Brighton companies have a tow boat service between Portsmouth and Ryde, which is run all the year round.

Unfortunately, there have been numerous complaints of inconsiderate driving in the Island by some of the drivers of the heavy touring cars which were there during the season. It is stated that some of these were driven regardless of the dangerous character of the roads there, which are very narrow and twisting, with very bad corners and steep hills. Conduct of this kind does great harm, causes public prejudice against motorists generally, and is the more unfair to the resident motorists because they have done all that is possible to keep on good terms with the police and the local authorities. The Chief Constable has informed Mr. Clarke, the hon. secretary of the Isle of Wight Motorists' Association, that if this reckless driving continues he will be driven to enforce the speed limit by timing.

CONTINENTAL NOTES.

An International Conference on Roads.

The French Government has authorised M. Barthou, the Minister of Public Works, to take the necessary steps towards the holding of an International Congress in Paris next year to consider the question of the preservation of roads deteriorated by motor traffic and their adaptation to meet the requirements of the new mode of locomotion.

French 1908 Models.

Announcements are coming to hand with regard to the different models the leading French motor-car builders are putting in hand for the 1908 season. Thus the Delaunay-Belleville series will include 15-h.p. and 20-h.p. four-cylinder with live axles, 28-h.p. four-cylinder, a 40-h.p. six-cylinder with chain drive, and a 15-h.p. six-cylinder live axle vehicle. The Panhard series comprises eleven different models—8-h.p. chain drive, 10-h.p. chainless transmission, one with three and the

days, the first six being devoted to trials with daily stages of about 150 miles (seven circuits), and only those vehicles which come successfully through the trials will be eligible to compete in the speed race on the seventh day over a distance of about 200 miles (nine laps). During the trials the cars must attain a maximum speed of about eighteen miles an hour, and all the parts will be officially sealed and stamped so as to provide against the possibility of their being replaced during the contest. In addition to the prize offered for the winning car another trophy, known as the Coupe de Régularité, will be awarded to the firm whose team of three cars makes the best performance throughout the trials.

Miscellaneous Items.

The Belgian Automobile Club proposes to organise a trial of industrial motor vehicles.—M. Henry Deutsch de la Meurthe has written a letter to the French Minister of War, offering to make a gift of his airship, the Ville de Paris, to the French army.—The Automobile Club de Nice is busily engaged in drawing up the programme for next year's Nice Automobile

Herr Friedrich Wagemann, of Vienna, at the wheel of his Brasier 50-60-h.p. Six-Cylinder Car on which he has lately completed a lengthy tour in the Tyrol. [Allgemeine Automobil Zeitung.]

other with four speeds; 15-h.p. with chain or chainless drive, 18-h.p., 24-h.p., 25-h.p., 35-h.p., and 50-h.p., all with four-cylinder engines and chain drive and a 60-h.p. six-cylinder vehicle with side chains. The new price list shows a reduction ranging from £20 in the case of the 15-h.p. to £280 as regards the 50-h.p. Considerable interest will be shown in the new live-axle cars, this being the first time the Panhard Company have made vehicles of this type.

La Coupe des Voiturettes.

Interest in French motoring circles is just now centred on the reliability trial of light cars which is to be held from the 21st to the 27th inst., and for which no less than sixty-seven entries have been received. The vehicles will be divided into two classes—(1) those with single-cylinder engines with a maximum cylinder bore of 100 mm., and (2) those with two-cylinder motors having a maximum bore of 80 mm. Each car must be completely equipped for touring, and carry not less than two persons, the total weight varying in accordance with the cylinder bore. The event, which is to be held on a 33·8 kilometre triangular course near Rambouillet, will extend over seven

week.—A public service of motor vehicles is about to be inaugurated between Vich and Manresa, Spain.—The Automobile Club de la Sarthe of Le Mans proposes to hold a trial of industrial motor vehicles early next year. The event will probably extend over a fortnight and comprise a section for public service vehicles.—The monument in memory of the late M. E. Levassor, which is being erected near the entrance to the Bois de Boulogne, Paris, is to be officially inaugurated during the course of the forthcoming Salon.—A 350 kilometre race for light cars is to be run off on the Florio Cup course, in Sicily, on Sunday next.—A company has lately been formed in Upsala, Sweden, to establish a public service in the district.—The Touring Club of Italy proposes to organise a trial of motor-buses at Plaisance.—The proprietors of the "Frankfurter Zeitung," of Frankfort am Main, have lately put an electric delivery van in operation, while the "Abendzeitung," of Augsburg, is employing a Renault motor vehicle for the rapid delivery of newspapers.—No less than sixty-seven entries have been received for the annual hill-climbing competition at Gaillon, which is to be held on Sunday next. Two Napiers are included in the list.

TYRE VULCANISING BY ELECTRICITY.

A NOVEL and interesting apparatus for vulcanising repairs to motor pneumatic tyres by means of electricity has lately been introduced by the Union Rubber and Chemical Company, of Unity Works, Shaw Street, Ashton New Road, Manchester, and is attracting considerable attention in motoring circles in the north. The apparatus, which is known

Fig. 1.

as the Turco, is exceedingly simple, comprising as it does a small wooden block, to one side of which is attached a curved plate of aluminium and a flat plate to the other. The plates are heated in the same way as an electric heater by means of a coil fitted within the block and through which a current of electricity for an ordinary accumulator is caused to pass. Three terminals are provided on the vulcaniser; only two are, however, used at a

Fig. 2.

time, the pair varying in accordance with whether the flat (for air tubes) or curved (for outer covers) side is being used. The *modus operandi* is exceedingly simple; the cover or tube to be repaired is made ready in the usual manner, clamped on to the vulcaniser, the necessary wires are attached to the terminals on the block, and to those on the accumulator—that on the car sufficing, provided it is fully charged.

It is then left for about twenty minutes, at the end of which time the repair will be found to be perfectly vulcanised, no attention having been necessary in the meantime. A special claim for the apparatus is that it cannot be over-heated; as soon as the requisite temperature is attained it remains absolutely stationary, the danger of excessive vulcanisation being thus avoided. Two sizes of the vulcanisers are at present being made. Fig. 1 depicts the No. 1 4-volt type in operation upon an air tube. It is designed to deal with nail holes and small bursts up to $1\frac{1}{2}$ in. in extent in tubes, and the superficial cuts and gasches up to the same extent in all types of outer covers. The machine is fitted with flat and concave vulcanising plates, both $1\frac{3}{4}$ in. by $1\frac{1}{4}$ in. The tube repairs are vulcanised on the flat plate, the necessary pressure being exerted by means of a convenient pressure clamp, while outer cover repairs may be vulcanised without removing the tyre from the wheel, in which case the concave surface of the machine is securely fastened on to the cover by means of a convenient strap provided for the purpose. The current absorbed is at the rate of, approximately, only $2\frac{1}{2}$ amperes per hour, but the apparatus should not be coupled to anything smaller than a 20 amp. hour accumulator. A large apparatus (Fig. 2), designed for use with an 8-volt accumulator, is also being made. This is designed to deal with much more extensive repairs, the flat plate measuring 4 in. by $2\frac{1}{2}$ in., and the concave one $3\frac{1}{4}$ in. by 3 in. The amount of electric current absorbed is at the rate of (approx.) 3 amperes per hour at 8 volts. This voltage is readily obtained by coupling two 4-volt accumulators in series, the makers recommending that these should not be of less capacity than 30 ampere hours each. The vulcaniser is put up with its necessary tyre-repairing accessories, and the whole outfit, in the smaller size, weighs under a pound, and about twice that weight for the larger one.

A NEW DASHBOARD FITTING.

THE accompanying illustration depicts a useful dashboard fitting for use in connection with electric tail lamps. It represents a tell-tale which can be fixed in any convenient position upon the dashboard. The idea of a lamp placed in series with the tail light has already been tried, and, being always alight,

has been found an annoyance by some drivers, and if 4-volt lamps are used an 8-volt accumulator becomes necessary. With the C.A.V. device, which has just been put on the market by Messrs. C. A. Vandervell and Co., of Acton Vale, W., the lamp is held out of circuit so long as current is passing through the tail light circuit; but, should this be interrupted from any cause, the electro-magnetic device in the indicator completes the other circuit and lights up the indicator lamp, thus warning the driver that the rear lamp is out. A further refinement is a push-button on the steering wheel, so connected that the lamp in the indicator may be lit up at will, quite independently of the tail light, enabling the lubricators, speed gauge, clock, &c., to be inspected while driving. The device was originally intended for fitting to the side of the cupboard of cars with the Daimler type of dashboard; a special bracket, however, can be supplied so as to ensure the light being thrown across the fittings of any type of dashboard.

THE Peterborough City Garage, Cowgate, Peterborough, have been appointed the sole agents for Brown cars for the Peterborough district.

MESSRS. W. WILSON AND SON, LTD., of Cambridge Street, Sheffield, have supplied a fine Roi des Belges body to a 40-h.p. Fiat car belonging to Mr. Rossiter Hoyle, of Ecclesall.

HERE AND THERE.

MESSRS. MANN AND OVERTONS, LTD., have lately supplied Unic petrol motor delivery vans to the "Daily Mail" and the "Evening News."

MR. PHILIP SAYERS has severed his connection with the firm of Sayers and Co., who have attained prominence in the motor-body building industry these last few years.

ELSEWHERE in the present issue will be found an interesting account of a fortnight's tour in Holland and Germany, made by Mr. R. M. Wright, the well-known Lincoln motor agent.

WE learn from the South Metropolitan Gas Company that they are meeting with an increasing inquiry for Benzole as a fuel for motor-cars in place of petrol.

MESSRS. MONNET PLASSE AND Co., of 20, Store Street, W.C., have been appointed agents for the Rapid America two-cylinder tyre inflator. By means of this pump, which occupies but a small space, it is claimed that only two minutes are required to inflate a 120 mm. tyre.

MR. D. W. BARNETT having relinquished his connection with the firm of Barnett, Pembroke and Slater, Ltd., has secured some excellently designed and roomy premises at 2, 4 and 6, Milner Street, Cadogan Square, Chelsea, where he is carrying on business under the title of the London Automobile Supply Company, and more especially pushing the sale of the Belgian "U. S. B." cars, for which he is sole agent. Mr. Barnett has latterly been employing his inventive faculties, and a new high-tension distributor, a new sparking plug with automatic detector device, and an apparatus permitting the use of high-tension current with low-tension magneto are shortly to be placed on the market.

WE illustrate herewith the first of the new Sheffield-Simplex 45-h.p. six-cylinder chassis, which will make its debut at the forthcoming Show. The photo was taken on the occasion of the initial road trial, a matter of ten weeks ago. During the time

Mrs. Hudson, the winner of the Manchester Motor Club's Speed Judgment Competition, at the wheel of her 30-h.p. Beeston-Humber. The test was to drive at seventeen miles per hour over a distance of nine miles, Mrs. Hudson being only 8 sec. out.

Photo by]

[H. Wade.

THE new motor ambulance wagon supplied by the Argyll Company to the Sheffield Corporation arrived in the city on Monday. Two bodies have been supplied with the chassis.

THE Belmont Motor Works Garage has been opened at 42, Streatham High Road, London, S.W., by Mr. Edwin Burchett, who will keep the establishment open practically day and night for the convenience of motorists.

THE Unic light delivery van has done exceedingly well in the Commercial Vehicle Trials. It has a clear record as regards depot and mechanical troubles, the only delay encountered during the five weeks test being 78 min., due mainly to tyre troubles.

AT a meeting of the council of the Cyclists' Touring Club, held at Birmingham on Saturday last, Mr. W. A. Russell, M.A. (Aberdeen), was elected secretary to the club, and Mr. A. W. Rumney, M.A. (Cantab.), was elected editor of the "C.T.C. Gazette."

ON Saturday, the 26th inst., Messrs. Hampton and Sons will hold an auction sale of motor-cars on the Brooklands track. All the vehicles offered will be passed by the firm's expert, and will be on the track for trial on the morning of the sale. More than thirty cars of the best-known makes will be included in the auction.

MR. WM. LONG, the proprietor of the Lion Hotel, Buckden, writes that the photograph reproduced in our last issue of the Napier car at present undergoing a 3,000-mile trial on Simcar benzol was taken outside his hostelry, and not at the Red Lion, Hatfield. Mr. Long has a well-equipped garage, and keeps a stock of petrol and lubricating oil.

IN Oxford Street, Swansea, Mr. J. S. Brown has a motor garage and a motor body building establishment of considerable extent. In the latter department he is now building an ambulance body for the Panhard chassis which has been subscribed for locally in connection with the fund organised by the Chief Constable of Swansea to provide a motor ambulance for the town.

Mr. Percy Richardson, Managing Director, and Mr. A. Rainforth, Works Manager of the Sheffield Simplex Motor Works, Ltd., on the first of the new Sheffield Simplex 45-h.p. Six-Cylinder Cars.

that has elapsed the car has been constantly on the road undergoing the usual preliminary tests, through which it has come out perfectly satisfactorily. The vehicle is fitted with a 45-h.p. six-cylinder engine, $4\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke, and live axle drive. Like its predecessor, the Brotherhood, it embodies a number of very important and novel improvements, both in design and construction.

MR. A. WHALEY has a garage and repair shop in Bridge Street, Forres.

MR. C. J. THORNHILL, J.P., of Castlebellingham, has lately ordered a 14-16-h.p. Argyll car.

MESSRS. J. GAIEN AND CO. have a motor-body building establishment in Annandale Street, Edinburgh.

LORD LEITH OF FYVIE has lately acquired a 24-30-h.p. Leon Bollée car from the Victoria Carriage Works, Ltd.

The above illustration depicts the capability of the Mors 15-h.p. Live Axle Car to turn round in a road of ordinary width.

The wheelbase of this car is 10 ft. 8 in., and the diameter of the inner circle shown in the picture is 22 ft., and of the outer circle 32 ft. 3 in. These figures show how ample is the wheel lock on this car, and how suitable it is for town driving.

THE British and Colonial Daimler Mercedes Syndicate, Ltd., have despatched a specially-fitted 30-h.p. Daimler-Mercedes car to the Central Motor Store and Garage, Lisbon.

THE magistrates of Eastbourne have intimated that they will insist upon the appearance of all motorists summoned before them, otherwise warrants may be issued for arrest.

MORS (ENGLAND) LTD., have issued a little pamphlet on *Motoring on Perfect Roads*, which will be of particular interest to those who reside in East Anglia; they will send copies to all applicants to 45, Great Marlborough Street, W.

AN organ grinder at Blackpool has recovered in the county court the sum of £6 4s. on account of damage done to a barrel organ by a gentleman running into it with a motor-cycle. The "musician" declared that the organ was sent spinning five yards, and the tunes, by reason of the concussion, were all mixed up.

IN his evidence before the Royal Commission on Vivisection, which has just been published, the Hon. Gilbert Coleridge said he regarded the Vivisection Act of 1876 with the same contempt that he regarded the Motor Car Act as regards speed limit, for "every motorist who has a motor-car, of course, breaks the Act."

MANN'S PATENT STEAM CART AND WAGON CO., LTD., Leeds, have secured a further order for a 5-ton steam wagon from Messrs. W. Hancock and Co., Ltd., The Brewery, Cardiff, this being the third order secured from this firm this year. A second 2-ton steam wagon has also just been completed for the Barnsley British Co-operative Society, Ltd.

MESSRS. H. MAWER AND STEPHENSON, LTD., house furnishers and art dealers, of Fulham Road, South Kensington, S.W., have in service a motor delivery van which takes the place of four horses. They are unable for the moment to give the mileage per week and the cost of operation and upkeep, but inform us that they find it very useful in the saving of the carriage of the goods by railway. They add: "We have every reason to believe that not only are we saving this expense, but the cost of operation and upkeep is not more than the four horses, &c., which it supplants. It is also a great convenience to both ourselves and our clients, as we are able to deliver direct to houses further afield."

MESSRS. HOWARD AND CO. have a garage in the London Road, Coalville.

H.M. THE KING OF ITALY has recently purchased a new Fiat 25-40-h.p. car.

GRANTOWN-ON-SPEY is a charming Highland town, in the High Street of which Mr. R. S. Ross has a motor garage, and from which he lets cars on hire to visitors.

AN advertisement has appeared in a Guildford paper calling upon electors only to vote for candidates who will promise to vote for (1) limiting the speed of motors to ten miles an hour, (2) for imprisonment instead of fines after first offence, (3) for the punishment of owner and all the occupants of the car as well as the driver, (4) for the prohibition of insurance against damages to outsiders.

MR. ADAM has, with the assistance of friends of the Scottish A.C., taken out a number of the members of the Lower District Committee of the Lanarkshire County Council in order that they might have experience of motor-car driving at various speeds, and special demonstrations have been given at one particular place at speeds varying from ten miles per hour upwards.

UNDER the guidance of Mr. Percy Richardson we had an opportunity a few days ago of going over the large new works of the Sheffield Simplex Motor Company, Ltd., at Tinsley, Sheffield. During the course of our visit we learned that a new industrial motor vehicle is in course of preparation for next year. We are precluded from giving full details, but may mention that the simplicity of control will be one of the features, and that the engine will be adapted to run on either petrol, alcohol, or paraffin.

UNITED MOTOR INDUSTRIES, LTD., have sent us copies of the wiring diagrams of the various patterns of "Castle" coils which they are now placing inside the lid of the respective coils, so that purchasers can always see at a glance the correct way to wire up the particular type of coil they have to deal with. They inform us that they will be pleased to send on the correct wiring diagram to any user of their coils who wishes to place the same inside the lid, on receipt of particulars as to the coil they have, and the car to which it is fitted.

The Patent Spare Tyre Cradle lately put on the Market by Messrs. William Cole and Sons, Ltd., of Kensington, W.

WE have received a sample of a new iron cement which is being introduced by Messrs. Kirlow Bros., Ltd., of 215, Pentonville Road, N., for repairing slight cracks or defects in iron and steel castings, water-jackets of petrol motor-cylinders, &c. When mixed with water to a thick paste, this cement sets hard in twenty-four hours, without heating. When set, oil, steam, and water have, it is claimed, no effect on it, and it can be filed, hammered and polished.

THE EARL'S COURT GARAGE.

APPEARANCES are often deceptive, and the motorist near-ing Earl's Court Station, S.W., would not imagine that the modest gateway opening near the station led the way to such a spacious establishment as that of the Earl's Court Motor Garage Co., Ltd. The entrance is a few doors from the railway station, which the rear part actually adjoins. On the occasion of a recent visit we proceeded through the gateway under cover for some distance and then found, to the left, a large showroom for the accommodation of new cars, among which the six-cylinder "Standard" occupied a well-favoured position. To the rear of this department is the repair shop, with inspection pit and a wide range of modern tools, under the direction of an expert engineer, whose knowledge of cars of various types is particularly extensive. Retracing our steps through a yard devoted to the washing of cars, and in the corner of which was a petrol store, we came to the time-keeper's box, in front of which is a starting "gate," always lowered until a car approaches for ingress or exit, when it is raised and the time of the particular vehicle duly entered. This is a distinctly good detail of organisation that makes for the ease of control and direction which should characterise such establishments.

We were now between two rows of private "lock-ups," above which were signs of domesticity not often found in a garage. But the premises originally belonged to a West End livery stable keeper, and have been adapted to the purpose of motor-car accommodation by the present proprietors, Mr. A. Powell being the managing director and Mr. A. W. Hemmings the manager. The rooms above what were the stables are now occupied by chauffeurs and their families, thus providing a great convenience in housing cars and drivers each within reach of the other. In founding this chauffeurs' colony the Earl's Court Garage has made an excellent innovation. For the relaxation of the men a clubroom has been furnished and fitted, and those owners who have been able to secure these private houses for their cars and house room for their chauffeurs have been provided with a distinct advantage.

Further rearward is the general garage, a well-lighted establishment that is evidently well disciplined, judging by the way the vehicles were lined up, to be easily accessible when wanted. The storerooms for accessories, the paint-shop, and other departments are replete with modern fittings and stock, so that the private owner who garages his car there is never at a loss for spare parts or accessories of any description. The modern building and general disposition of the various departments enables everything to be done "decently and in order," to the advantage of the motorist who likes to see the work in progress. The electrical plant for the charging of accumulators is complete, and tyre repairs are also undertaken, while those whose vehicles are under repair can hire others from stock, so that professional men who are clients of this establishment are never inconvenienced by the temporary waywardness of their vehicles. In addition the firm are sole London agents for the "Standard" car already mentioned, which has become well known during the past season, particularly the 15-h.p., 24-30-h.p., and 30-40-h.p. sizes.

Some idea of the extent of the Earl's Court Motor Garage may be gleaned from the fact that the depth from the entrance to the end of the main garage is 350 ft., the width being 56 ft. The depth of the showrooms is about 150 ft., the width being more than 40 ft., thus giving opportunity for the display of cars for sale and exchange—in both of which branches the company have been very active of late. They make a special point of thoroughly overhauling cars, and trust to the efficiency of their work as the keynote of a success which is as real as it has been rapid.

THE Daimler Motor Company issue an interesting pamphlet on the adjustment of their vehicles, which will be of service to those who drive or own Daimler cars. They also send a neat calendar reminding us of the flight of time as well as of the automobile.

THE "EDOUARD" WIND SCREEN.

WITH the advent of rain and cold winds our thoughts naturally turn to the question of the various devices that are from time to time being introduced by the many caterers for the comfort of motorists, and one of the most necessary and comforting things is the wind screen. There are many of these on the market, one of the latest being the "Edouard," manufactured by Mr. E. W. Willard, of 32, Paradise Street, Birmingham. It possesses several good features, notable among them being the ease with which it can be adjusted to the various positions—six in number. We notice that provision is made for adjusting this screen at 30 and 40 degrees towards the driver, the object being to enable the standard screen to be fitted to any type of car without having to worry about the distance of the steering wheel from the dash, which distance varies considerably. The screen is made to fold down away from the driver. The locking arrangement is simplicity itself, there being a steel screw attached to a

curved handle, as shown in accompanying illustration. This binds the joint together and gives a positive lock, so that it is impossible for the screen to rattle—unfortunately a common fault of screens. The device we have inspected was fitted with a solid metal frame, the glass being firmly embedded in rubber and the

frame itself being lined with felt stripping three-eighths of an inch thick. It certainly has a very smart appearance, contrasting with the ordinary casement style of window frame often seen. Mr. Willard is also making the screen with mahogany or walnut frames.

The firm are also supplying under licence the well-known "Gordon" wind screen with mahogany, walnut, or solid metal frame. Any of these screens can be fitted with Pilkington's patent wired glass if desired.

A CAR for breakdown work is always available in the garage of the Ashton Motor Company in Chester Square, Ashton-under-Lyne.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-28, Charing Cross Road, London, W.C.]

RACING AT BROOKLANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In my recent correspondence with Mr. Edge it has been suggested that I have made certain innuendoes and accusations against the committee of the Brooklands Automobile Racing Club. It is difficult for me to understand how such an interpretation could have been put on my remarks. I should have thought that the manner in which I have always tried to support the club was sufficient proof that I was incapable of making any such innuendoes or accusations against the Brooklands Club; but, inasmuch as my remarks have evidently been misconstrued in certain quarters, I wish to take the earliest opportunity of entirely dissociating myself from any such expressions of opinion, and to withdraw unreservedly any comments of mine which could possibly be misconstrued in this manner.

What I meant to infer and what I still think is that a vital mistake has been made in commencing the standard classes during the present year, as in my opinion by doing this, much, if not all, interest has been taken out of the same owing to the fact that only one manufacturer had cars ready to compete this year in the three lower classes. I do not think any further comment on this is neces-

subservient to the engineer, and must design his work in accordance with the chassis supplied to him. The wheel basis, the height from the ground, suspension, and many other details are already laid out for him by the chassis builder. I have for some months been using for town work a front-driven town carriage built by the Pullcar Motor Company, of Preston.

This type of vehicle gives the coach builder an opportunity of carrying into effect designs impossible with the rear-driven machines, either of the chain or cardan type, as the whole of the machinery in this new type is carried in the space between the front axle and the driver's seat. The chassis, in reality, does not extend beyond the driver's seat, the whole of the carriage work with the back axle and spring suspension being attached by edge-plates to the front mechanical portion; thus the carriage portion is entirely free from mechanism. It is easy to conceive with this arrangement the opportunities which exist for elegant carriage work. One feature is especially remarkable, and that is the nearness of the entrance to the ground.

A few years ago it was not possible to produce a front-driven vehicle which could be accepted as a commercial proposition. To-day, however, under improved methods of construction, such a vehicle as I have described is in existence, and is bound to find considerable favour

Mr. Oscar Cupper on the 48-h.p. Metallurgique on which he won the Medium Handicap at Brooklands.

sary than to draw attention to the results of last Saturday's racing at Brooklands, when the whole of these three classes were won by the same make of car, i.e., the 26-h.p. class, the 60-h.p. class, and the 40-h.p. class, the latter of which failed to fill originally and was transformed into a private sweepstakes.

The idea of having standard classes I quite agreed with at the time it was proposed, and I still agree with, but I and others certainly understood that these classes would not come into operation until next year, when by such time all manufacturers would have had an equal chance of constructing cars to take part in these classes.—Yours truly,

A. HUNTLEY WALKER.

MOTOR-CAR DESIGN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with very great interest the paper and discussion at the recent meeting of the Institute of Carriage Manufacturers at Chester, and also the contributions which have since appeared in the Press relating thereto. It is very evident that the carriage builders of this country have taken up in a thoroughly serious manner their fair proportion of the development of the motor industry, and have done quite as much as engineers to popularise the use of motor carriages. However, I think I am correct in saying that up till now no motor vehicle has been introduced which has given the carriage builder a free hand in the execution of his work, but there are signs that such a vehicle is coming into use, at any rate for town work.

With the usual form of rear-driven chassis, the carriage builder is

for town work, which, it is fair to say, will be increased by the co-operation of the carriage builder. In fact, the vehicle will probably be more appreciated by reason of the excellence and suitability of the carriage work than for the advantages of its mechanical construction.—Yours truly,

J. S. CRITCHLEY, M.I.Mech.E.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice in your last issue a letter from the New Engine Company relative to some remarks made by Sir William Angus at the meeting of the Institute of British Carriage Manufacturers. Sir William, speaking to a meeting of coachbuilders, expressly stated that motor-cars had come to stay, and pointed out some of their special advantages. His opinion that horse-drawn carriages still had a use, and a future seems to be generally accepted by the almost universal approval of the Press. That he did not speak in antagonism to motors may be well believed from the fact that we have two very large factories, one of which is entirely confined to the manufacture of motor bodies, and hold several valuable agencies.

Sir William Angus and the other directors of this firm have always felt that there was tremendous scope for the first-class coachbuilder in the motor body trade, not only as regards external finish and comfort, but in the general lines and proportions. It has always been our endeavour to incorporate in our motor bodies the best traditions of the coachbuilding art, and not to adhere slavishly to the conventional lines.—Yours truly,

W. ANGUS, SANDERSON AND COMPANY.

THE BRITISH AIRSHIP AND FOREIGN ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I saw it stated in a contemporary that Colonel Capper, as a Britisher, regretted the fact that the engine of the Army airship was of French construction, but hoped that this nation would be able to compete with the French in constructing that part of the airship's mechanism. This is a direct challenge to British engineers, and everyone will appreciate Colonel Capper's sentiments. It is now an indisputable fact that, as far as motor-cars are concerned, the best type of British engine is superior to any foreign make, and it only remains to be shown that British engineers can design an engine for the nation's military airships which will supersede the French machine by reason of its superior qualities. En avant!—Yours truly,

H. F. TRIPPEL.
Major, Army Motor Reserve.

COMPARATIVE TESTS OF MOTOR FUELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—So much has been stated recently in the technical journals with respect to various new fuels that are being placed on the market, and so much is said in discussions amongst motorists generally as to whether one car or another runs at its best or at its worst with various makes of spirit, that it was judged opportune by Weigel Motors, Ltd., to make a few tests with the brands of petrol that are at present best known on the market.

For this experiment, a standard 40-h.p. Weigel engine was selected, the bore and stroke being 130 mm. and 140 mm. respectively. Three tests were made with each brand of petrol, and an average was taken of each of the three tests, with the results set out on the chart we are

sending you herewith. The chart is almost self-explanatory, but it ought to be mentioned at the beginning that on Pratt's, Bowley's, and Shell motor spirit being tested with a densimeter, the difference in specific gravity between the makes was so small as to be negligible.

It will be noticed that there is practically little difference in the maximum power given amongst the three brands. What is chiefly noticeable, however, is the way in which Pratt's spirit takes a comparatively sudden upward rise at about 600 revs. per min., while the Shell spirit seems to pull very steadily throughout. The indications after 1,100 revs. per min. do not show very much, and for this reason we have not inserted them in the chart. The same engine with exactly the same appliances was used throughout the tests, and perhaps it might be of interest to you to know that the diameter of the jet was 1.3 mm., the temperature of the shop in which the tests were made 71 deg., and the temperature of the circulating water 167 deg. The tests, of course, were made electrically.—Yours truly,

C. E. WHITTAKER.

WHEELS FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 12th inst. Mr. E. H. Gelder charges me with ignoring two letters of his in previous issues. My reason I thought was obvious. It is because there is no form of pneumatic tyre which brings the motor-car within the reach of the man of moderate means, commercial travellers and other classes who would use it but for the tyre troubles and expense. Let me mention one case:—A firm paid £40 for a set of covers and tubes. They ran them less than 4,000 miles. There were some delays due to punctures. At this price the head of the firm cannot see his way to displace any more horses. This is a typical case of many that have come under my notice. It is, in fact, the experience of most motorists. In my last letter I mentioned certain points which should be studied in the production of a

new tyre. When it is discovered (which it must be sooner or later) there will be just as many pneumatic tyres used, I have no doubt, but three times as many cars used.

In conclusion, I would remind Mr. Gelder that favourite and pet theories are continually being upset when examined under new conditions. The motor industry has now reached the stage that demands an economical, reliable and safe tyre. The greatest friends of the pneumatic cannot claim this. One thing is quite certain, we must approach the matter with an open mind if we want an improvement, and, although neither of the tyres mentioned by Mr. Gelder appeal to my mind, I have no doubt they possess features which recommend them for some purposes. It is only by allowing inventors a fair show, and by this means encouraging them, that we are likely to arrive at the desired result.—Yours truly,

O. COOK.

[This correspondence is now closed.]

WIRE V. WOOD WHEELS FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice in your issue of the 12th inst. an inquiry as to the relative value of wood and wire wheels for motor-cars. As manufacturers of both we are of opinion that wire wheels are not so liable to collapse in case of accident, but that in actual strength there is not much difference. We have made many wood wheels to replace wire wheels, but have never yet made a wire wheel to replace a wood one, which plainly shows public opinion in the matter.—Yours truly,

ROBBINS AND SONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Major H. F. Trippel, wire wheels are far stronger than wood wheels, but for general use not preferable, as they need care in keeping clean, and if the spokes are allowed to rust in the hubs they get brittle and break. Wire wheels are not new as applied to motor vehicles, they were used in some of the earliest cars, but the Lauchester Engine Co. made a speciality of them, and with great success, as they paid special attention, as is absolutely necessary, to the building of them.

Considering the weak rims which are used at present in the construction of wire wheels, these wheels are very strong; but if special hollow rims, such as those which were used in cycles in the past, were manufactured to suit motor vehicles, we should have wheels which would yield wonderful results.—Yours truly,

W. D. SPILLER.

TRAFFIC REGULATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was glad to see in a recent issue a reference to the blockage of traffic which occurs in several congested parts of the City of London, owing to the way in which the vans of carriers and other traders are allowed to line up by the kerbstone, often for a considerable length of time, without interference from the authorities. This is particularly observable on Monday mornings in the region about St. Paul's Churchyard, and on nearly every morning of the week along Ludgate Hill. If the police authorities could devise some plan for keeping this traffic moving, or not allowing it to remain after 8 a.m., it would considerably facilitate the moving traffic in the busy hours that follow. The advantages of motor-buses and even of motor-cabs are freely curtailed by the present system—or rather, I should say, the want of method that prevails.—Yours truly,

LONDONER.

A STEAM CAR ENTHUSIAST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is no doubt that a racing Stanley or White would be very fast indeed. I should like to see one built. Steam cars have not received the attention which has been devoted to petrol cars, and in consequence they are not popular. Nearly all steam cars have been too lightly built and lacking in the engineering department. Your correspondent mentions the White car, in my opinion the best ever before the public. I had practical experience with the 10-h.p. car, and I can conscientiously say that it gave me no more trouble than a petrol car, whilst for its rated power it could beat a greater powered petrol vehicle. Sweet running and a magnificent hill climber, it stood up well. I should think an up-to-date White car would be a tip-top vehicle.—Yours truly

W. O. S.

PETROL IN MANCHESTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with much interest a letter from Mr. Whittaker, of Weigel Motors, Ltd., in regard to some local motor spirit which he got in a garage in Manchester. I fully agree with what Mr. Whittaker says, as I had the same experience as he had. I purchased the spirit in a garage in Manchester, about six or seven weeks ago,

as I was told that they had nothing else in stock, with much misgiving, as I had never heard of the same.

I started home from Manchester on my 40-h.p. Pilain and arrived in London after very much trouble; this local spirit having entirely upset the carburation of my car. It took me just about one week to get rid of the evil effects, as I had nearly to pull the engine to pieces in order to get it out.

The valves were all coated with a thick hard deposit and all the pipes were more or less choked up, therefore I think that the public ought to be warned against a spirit that has such an effect, and I think that Mr. Whittaker has performed a public service in calling attention to the matter.—Yours truly,

E. D. HEINEMANN.

THE USE OF FRENCH CHALK IN TYRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad to hear the opinions of readers of the *M.C.J.* on French chalk in motor tyres. The question I wish to ask is, does it prolong the life of a tyre, say, of a 10-h.p. car? My idea is to put this into the tyre to help to get the tube into place to make it slip better and prevent nipping, not to prolong the wearing capabilities of a tyre. Of course, it will prevent chafing, but other than this will it make a tyre wear any longer?—Yours truly,

G. W. W.

The above illustration depicts the new car the Daimler Company have just supplied to King Edward, making His Majesty's ninth Daimler. The vehicle is a 104 ft. wheelbase landaulet, painted in the Royal colours, lake with black mouldings and lined vermillion. The outside fittings are brass, and the interior ones silver. The upholstery is in dark blue Cape goat hide, and the car is provided with a full complement of accessories, such as table, clock, barometer, speaking tube, electric light, &c. A feature of the car is the doors, which are fitted with special hinges made by the Daimler Company, which throw the doors back so that when open the inside surface of the door is level with the post, and not in front as is usual.

THE TRANSMISSION QUESTION—LIVE AXLE v. CHAINS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I take it that it may be taken as an hypothesis that: 1. Manufacturers build such type of cars as they think will sell, that is, as the public are likely to want and consequently buy; and, 2. the public want a car that is ideal, cheap, simple, always goes and never gets out of order. Does a chain drive fulfil these two requirements more than a live axle? If this is so, then the chain drive is an easy winner; but is it? More chain-driven cars than live axle ones should be on the market if it were so, but enquiry proves the contrary; more chain-driven cars should break down than those of the other transmission type, but once more the reply is in the negative.

Truly Churchill says:

"When fiction rises pleasing to the eye,
Men will believe, because they love the lie;
But truth herself, if clouded with a frown,
Must have some solemn proofs to pass her down."

In the live axle, chains are not needed; a countershaft is conspicuous by its absence, and the transmission is direct by bevel on to the differential sleeve of the axle, to the ends of which the road wheels are keyed. This is certainly easier to make, and what is of course important to the makers, much cheaper, but—and it is always the but—the live axle is heavier than the dead one, therefore more weight on the tyres, and, what is more, more unsprung weight, which means more liability of

shock to the bevels and also greater wear of tyres. We will take it that at the motor manufactory, as a result of great care and inspection, the bevels mesh perfectly, so that there is no undue strain, no possibility of "bottoming." There is, however, an enormous side thrust on the big bevel, which is taken up by a bearing with collars or balls; this bearing, as a result of wear, after a time allows of play, and bevel teeth may tear out, shafts break, all troubles which are beyond roadside treatment.

The transmission by a propeller shaft must be rigid; with a chain a slight error in alignment does not matter, and this seems to be so great an advantage that the abandonment of a flexible transmission is to me incomprehensible. Chains are so easily adjusted and replaced, not so bevels and fixed shafts. Still the public seem to be devoted to the live axle, and hence, I presume, the large quantity on the market. It is true, that chains are greasy, messy things to handle, but, if a greasy coat is not objected to, anyone can adjust them or put a new one on; but, from experience, I can say that to take down a live axle and bolt on a new big bevel on to the differential sleeve is a worrying, unpleasant job.—Yours truly,

T. W. H.

ROAD SIGNS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—It has been my misfortune to find myself on most impossible hills—hills that nothing would induce me to attempt. Being, as a rule, however, half-way up before realising their severity, there has been nothing for it but to continue. I would respectfully suggest that a warning board be placed at the bottom of such hills, thus:—

DANGEROUS HILL.

Steepest portion
1 in — ?

I am sure there are others who have found themselves in the same predicament and would be grateful for such warning. The two worst ascents I have in my mind are the Peak at Sidmouth and one ending at Bala, in Wales. These hills could, and certainly would, have been avoided by me had I had an idea of what I was about to undertake.—Yours truly,

PETER YATES.

LOCAL AUTHORITIES AND STEAM WAGON AXLE WEIGHTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I, through the medium of your paper, bring to the notice of such readers as are, or propose, using steam wagons, the attitude of our local authorities here in Bristol? They are insisting, to the letter, upon the observance of the law as set forth in the Heavy Motor Car Act, and, as I believe this action will soon become general, it behoves users of motor-wagons to be most careful, especially regarding loads carried. Very few wagons indeed will carry their advertised load without exceeding the legal axle weights, i.e., 8 tons rear, 4 tons front, and every buyer of a wagon should insist that the maker place the full load on the platform, and with water in tank, fuel in bunkers, weigh on a public machine. The penalty for excessive axle weights is £10, and this promises to afford a revenue equal to that at present derived from users of pleasure cars exceeding the speed limit.—Yours truly,

BRISTOLIAN.

THE SLIP OF THE CLUTCH.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is a line of Stillingfleet which, though automobiles did not exist in his time, still is most applicable, especially to the slip of a leather-faced clutch. It runs:—

"No part of conduct asks for skill more nice."

The tyre people tell you to slip your clutch over bad roads, it prolongs the life of the tyre; they omit the effect of this practice on the clutch itself. A burnt leather is hard and is fierce, and what is more dangerous, castor oil is very good for leather and in moderation for clutches, but it is not much use applying the oil to charcoal, it cannot soften it. In going down a hill it is safer to leave the clutch in, with, say, the second gear in mesh, the engine then acts as a brake; if the throttle is closed the clutch cannot get hurt and the brakes are saved for another day. The same applies for traffic and turning a corner; employ the throttle, it is much better. I met a man in Norfolk recently who thought so. In taking corners, he was the personification of carefulness; he always slipped his clutch, but did it once too often. At our encounter he was on his way to Stalham with a single horse in front of the car; there were, as well, ten useless non-four-legged ones under the bonnet, but they could not be brought to exercise their power on the wheels. He carefully took a corner with the clutch out and then let it in once more; there was a little noise and the automobile remained at rest. He slipped back to the second speed, the result was the same—then the four-legged horse. I pitied that man; I saw him again at the garage at Stalham. His gear-box was down, and the diagnosis of his car's breakdown was revealed. The bolts holding the big bevel to the differential sleeve on his countershaft had all sheared off, but the teeth

of both bevels were intact ; as a result of the six bolts shearing off, the big bevel fell right away from the small one, thus saving the teeth. He had better luck than he deserved. He was a bigger man than myself, so I did not like to preach him a sermon about letting in the clutch with care ; besides, he was too busy burring over the new bolts to listen. I feared, too, his quoting :—

"If things go wrong, each fool presumes t' advise,
And if most happy, thinks himself most wise ;
All wretchedly deplore the present state ;
And that advice seems best which comes too late."

This gentleman's trouble—I think it took him five hours to get his machine on the road again—will be, I trust, an excuse for this letter, the moral of which is "Do not slip the clutch and let it in with care."—Yours truly,

H.

WHY MOTORS LOSE POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Does not "Old Hand" in his letter of the 28th ult. omit rather an important point in his analysis of the causes for motors losing power?

I quite agree with the causes he suggests—lack of compression, bad carburation, and faulty ignition ; but what about valve timing ? It is my experience that after an engine has run for some months the distance between the valve stem and the tappet is almost certain to have increased, causing the valve to open the fraction of an inch too late and close too soon. This means that the engine in one operation loses a fraction of its power, which probably is almost infinitesimal, but which, when it is remembered that the operations are taking place at

becomes incandescent and readily fires the charge before the fixed time of ignition. As the exhaust valve also appears to get very hot, it would be very advisable to see that the water jacket around the same is quite clear.]

THE HOTEL QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your reference in Comments to the way in which the average hotel proprietor regards the motorist is none too strong. There are many of these folks who should be pillorised, but I suppose editors do not want libel cases. But by way of support to your contention I would offer the following instance from the "Manchester Daily Despatch" showing how the motorist is "rooked" by some hotel proprietors as compared with other travellers. Two friends, one a motorist the other a cyclist, put up together at a hotel in the Lake district. They dined together at the same table, partook of the same fare, received equal attention, and occupied similar bedrooms. But the accounts varied as follows :—

Motorist.	s.	d.	Cyclist.	s.	d.
Dinner	3	6	Dinner	2	6
Breakfast	2	6	Breakfast	2	0
Attendance	1	6	Attendance	nil	
Garage	1	6	Garage	nil	
Bed... ..	3	6	Bed... ..	3	0
Total	12	6	Total	7	6

When the motorist protested he was merely told that he was only charged the usual motorist's tariff.—Yours truly,

A MOTORIST ON TOUR.

Motoring in Brazil.

The Wolseley Motor Company have recently established a branch at Rio de Janeiro, and already the Siddeley cars have become very popular in the country. The above illustrations depict a 10-12-h.p. Siddeley in the mountains. On the left the car is seen descending from the Bamboos after taking five people up, this being the steepest gradient in the district. On the right is seen the Boulders Gavra, where the road passes under the natural arch formed by rocks fallen from 1,000 ft. above.

the rate perhaps of 15 per sec. or 900 per min., contributes very materially to the inefficient running of a car.

I do not think this point should be omitted from "Old Hand's" list of causes for motors losing power, as during the time I have been motoring I have always found it to be a point of the very greatest importance.—Yours truly,

GEO. SHERRIN.

AN ENGINE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 6½-h.p. single-cylinder car which continues to fire after current has been switched off. I also get premature ignition on the road and knocking on the slightest rise of a hill. The water circulation is good, the water never boiling. The timing of the engine is correct, the exhaust closing at top of stroke. I have tried advancing, also retarding the ignition a tooth or two, without result ; it appears, on taking out the inlet valve, that the top of the exhaust valve gets red hot, it being of a slightly reddish colour. The silencer is clear, also the exhaust pipe, and there is no back pressure. The compression of the engine is good. After running a few miles the engine will sometimes stop after gradually getting weaker. If you or some of your many readers can assist I should be very grateful.—Yours truly,

F. MILLER.

[The trouble experienced by our correspondent seems to be one with which many motorists are troubled. The premature firing is without doubt due to the carbon deposit in the cylinder head, which accumulates to a very great degree, if not periodically cleaned out. This deposit is formed by the lubricating oil becoming burnt and forming a scale in the cylinder head, which, after the engine has been running for a short time,

WE have an inquiry for the name and address of the makers of the "Pegasus" non-skid band.

MESSRS. C. A. VANDERVELL AND Co. inform us that a firm are advertising C.A.V. accumulators at a very low price. They have never supplied the firm in question with any goods whatever, and it is "obvious that the goods are to all intents and purposes second-hand, and cannot carry our usual guarantee."

RACING CHALLENGES.—We have received a long letter from Mr. Huntley Walker in reference to a race between Napier and Darracq cars, in which he states :—"I am anxious to end this lengthy correspondence between Mr. Edge and myself, and I make him the following very clear challenge which cannot be misunderstood :—I am willing to race Mr. Edge for one mile and for 500 miles for a stake of £5,000 in each race. The one mile race I am quite agreeable to run at Brooklands on Saturday next, the only point that I want to make clear being that it must be a race pure and simple and not complicated in any way with conditions, the fastest car to be the winner. If Mr. Edge is willing to allow the mile race to take place at Salon, in France, where it is possible to get a straight two miles, instead of the Brooklands track, and agree to the race being two miles instead of one, I am willing to give him a start of one hundred yards. In regard to the 500 mile race there is a very simple method of settling this also. Mr. Edge has stated that he is going to enter three cars in the next year's French Grand Prix, therefore I am quite willing to take the three Darracq cars which will be entered in the same race against Mr. Edge for a stake of £5,000 on each side. There is therefore no necessity to arrange a special race, let our contest form part of the big race."

MESSRS. HANCOCK, WRIGHT AND Co. have a motor garage at 23, Orville Street, High Street, Battersea, S.W.

CLUBS AND ASSOCIATIONS.

MANCHESTER MOTOR.

THE concluding competition of the Manchester Motor Club took the form of a speed judgment test for all types of motor-cars and cycles. Entries were received at the starting point, Hoo Green, near Knutsford, and a distance of nine miles was traversed in the direction of Lower Peover. A given speed was announced to each of the seventeen starters, and the prizes awarded to those covering the distance at the nearest given speed. The winning car, a 30-h.p. Beeston Humber, owned by Mr. T. Garner, was driven by Mrs. Hudson. At the conclusion of the speed test upwards of forty members sat down to tea at the Warrendale-Tabley Arms.

During the winter unofficial runs will be held at the week ends, and monthly concerts will be held at the Albion, headquarters of the club.

LINCOLNSHIRE.

THERE was a gathering of motorists at Revesby (a pleasant Lincolnshire resort), on Thursday last week, on the occasion of the last meet of the Lincolnshire A.C. Revesby is noteworthy for its picturesque inn and for the Abbey, where the Hon. Mrs. Stanhope has some of the loveliest gardens in the whole country, and which were thrown open to the members, as was the deer park, the fernery, and other enchanting places. The meet proper was at the inn, and quite a large number took tea there afterwards. We understand that it has been decided to hold a great meet at Revesby next June or in early July.

At a special meeting of the Lincolnshire A.C. the complaints as to the speed of cars on the North Road were considered and action dis-

COMPANY NEWS.

SEDAN AUTO-CAR SYNDICATE.—£10,000 (£1). To adopt an agreement between W. T. Skelding and Company, Ltd., and N. C. Gilbert for the acquisition of the Burnt Tree Engineering Works and the interest of the said company in patents (1) for an invention of T. Parker for improvements in motor-cars and (2) for an invention of L. Wirtz for improvements in variable and reversible gear, &c. 51, Lichfield Street, Wolverhampton.

ZENITH MOTORS.—£4,000. To take over the business of motor and cycle manufacturers, &c., carried on by Messrs. W. M. Wood and W. R. Johnson at 101A, Stroud Green Road, N., as the Zenith Motor Engineering Company. First directors: Messrs. W. G. Bower (chairman and managing director), W. J. Tooley, and W. M. Wood.

ST. ALBANS AND LUTON MOTOR COMPANY.—£5,000. To acquire the business carried on by Messrs. F. A. Giffen, R. G. Byers, A. C. Tilley and F. H. Giffen at London Road, St. Albans, and at Bedford Road, Luton, as Tilley, Giffen and Co., and to enter into an agreement with Messrs. A. C. Tilley and F. H. Giffen. No initial public issue. Signatories to appoint first directors. 200 shares. As fixed by company. London Road, St. Albans.

LOWE AND WOOD.—£5,000. To take over the business of dealers in motor-cars, tyres, and accessories carried on by Mr. C. L. Lowe at 77, Broad Street, Birmingham, as Lowe and Wood. No initial public issue. Registered without articles.

WASP CARS.—£3,000. As title. Agreement with J. W. White. Minimum cash subscription, 10 per cent. of shares offered to public.

STEPNEY SPARE MOTOR WHEEL, LTD.—The first annual meeting of the Stepney Spare Motor Wheel, Ltd., was held on Friday of last week at the Midland Grand Hotel, London. Mr. W. B. Jessop, chairman of the company, presided, and referred to the points of the balance-sheet,

The Meet of the Lincolnshire Automobile Club at Revesby.

ussed. Letters were received from prominent authorities in the county cordially approving of the action of the L.A.C. committee, and complimenting them on the improved conditions. The police have been instructed to act, and rigorous action is to be taken. The letters sent out to the *M.C.J.* and other papers by the Lincolnshire A.C. have, it is said, already borne fruit.

WEST ESSEX AUTOMOBILE CLUB.

THE competitions sub-committee announce that the result of the speed judging competition held on the 5th inst. was as follows:—1st, I. C. Brown, 3½-h.p. Brown; 2nd, A. E. Dendy, 3½-h.p. Centaur; 3rd, C. D. Makepeace, 7-h.p. Phoenix Quadcar.

Mr. Makepeace is the winner of the club aggregate prize for best average throughout the season. He secured 49 points, Messrs. Baldwin and Brown being a tie for second place with 47 points each.

At a meeting of motor-cyclists held at the Grand Central Hotel, Leeds, a new organisation, to be known as the "York County Motor Cycle Club," has been formed.

A NEW patent change-speed gear for motor-cars is being introduced by Messrs. Mero, Ltd., Renton Street, Sheffield.

WE are informed that Mr. W. E. B. Schreiber is no longer connected with Messrs. Perry, Thornton and Schreiber, Ltd., and that the control of Ford cars for the British Isles is now in the hands of Mr. P. L. D. Perry and Mr. B. M. Thornton, who are the sole directors and shareholders in the company.

which was summarised on page 683 of our last issue. He mentioned the formation of the German company and also the offer of an option for the purchase of the American patent rights by an American company. The adoption of the report was seconded by Mr. R. L. Wood, who spoke of the progress made at the German branch and the possible development of business in the United States. The motion was then carried unanimously, a vote of thanks to the chairman closing the proceedings.

CLAIM AGAINST MOTORIST.

WILLIAM KNOTT, of Ford, brought an action against Henry Franklin, motor-car proprietor, Shrewsbury, in the Shrewsbury County Court, to recover £20 damages for the loss of a greyhound dog alleged to have been killed as a result of the negligent driving of a motor-car by defendant's son. On May 22nd the plaintiff was driving home from Shrewsbury, and his case was that the greyhound was running alongside his horse when the car came along at a high rate of speed, without sounding horn or bell, and ran over the dog, the animal dying immediately. The defendant and his witness contended that the greyhound ran in front of the car when it was travelling at a speed of twelve to fifteen miles an hour, and that the accident was unavoidable. His Honour said he did not consider negligence had been proved, and there would be judgment for the defendant.

MESSRS. BATEMAN AND SON have opened premises at 18, Western Broadway, King's Street, Hamm-smith, where they are giving daily demonstrations on the H.F. car vulcanizer.

RACING AT BROOKLANDS.

THE concluding meeting for the present season of the Brooklands Automobile Racing Club on Saturday proved a great advance on any that have preceded it. Evidently the officials have wisely read the papers and profited by the many hints and suggestions thrown out by practical observers of the sport. The members' enclosure was nicely patronised so far as motor-cars are concerned, and the paddock was well filled with members of the B.A.R.C. The enclosures open to the public, however, never seemed to contain a great crowd, and general interest in the events only approached enthusiasm at one point during the afternoon, viz., in connection with the private stakes, when the contest between Lieutenant-Colonel Carleton-Smith's Napier and Captain Howell's Iris proved an exciting event. The official attendance was given at 7,000.

The new arrangements for supplying petrol to the cars just outside the paddock assisted the officials to start each race punctually; in fact, on one or two occasions it seemed as though they too were racing against time. The result was that between 2 o'clock and 4.30 p.m. the six events had been decided, and many of the public were at the railway station for home. Altogether the businesslike proceedings were to the advantage of the track, as likely to secure public approval.

As we announced in our issue of the 5th inst., new regulations for drivers were contemplated by the management with the view of diminishing the risk of collision to a negligible amount. These were enforced on Saturday; brakes had to be applied and power shut off immediately the finishing line of small flags suspended across the track was passed. Drivers were then instructed to reduce speed to between

In good time the second 26-H.P. RACE was run. This was for cars of a cylinder dimension of 64 or under and brought forth six competitors. The distance was $2\frac{1}{2}$ miles, and Mr. O. Cüpper's 25-6-h.p. Metallurgique and Mr. E. J. C. Roberts's 25-6-h.p. Arrol-Johnston made the running early, but were overhauled by the Napier with the result:—Mr. S. F. Edge's 25-6-h.p. Napier (F. Newton), 1; Mr. O. Cüpper's 25-6-h.p. Metallurgique (Owner), 2; Mr. J. S. Napier's 25-6-h.p. Arrol-Johnston (E. J. C. Roberts), 3. Also ran: Mr. H. E. Hall's 25-6-h.p. Germain (Owner); Mr. H. G. Nicholson's 25-6-h.p. Britannia (G. V. Fowler); and Mr. W. Phillips's 25-6-h.p. Coventry Humber (W. G. Tuck). The Humber made a good start, but the race was really between the Metallurgique and the Napier, the former securing the victory by ten yards at an average speed of $55\frac{1}{2}$ miles per hour.

THE OCTOBER HANDICAP SWEEPSTAKES was over a distance of $5\frac{1}{2}$ miles, and was for motor-cars with a cylinder dimension of 150 or over. There were three runners, the result being as follows:—Mr. F. R. Fry's 7-59-h.p. Mercedes, 789 yds. (D. Resta), 1; Mr. S. F. Edge's 60-h.p. Napier, 1,178 yds. (C. W. Smith), 2; Lt.-Col. C. D. Carleton-Smith's 60-h.p. Napier, 1,287 yds. (C. A. Glentworth), 3. This race was never in doubt—save, of course, for the possibility of mishap to the leader—and Resta won very easily at a speed of $88\frac{1}{2}$ miles per hour. Glentworth was second in the first lap but his engine was missing badly and he was passed by the other Napier in the race.

Half the meeting was thus over and the organisation had fully justified itself. There was considerable interest in the SECOND 60-H.P. RACE, for cars with engines of a cylinder dimension of 150-1 or under. The bookmakers were particularly vehement

Racing at Brooklands.—The Scene in the Paddock.

twenty and thirty miles an hour prior to reaching the bend connecting the finishing straight with the main track. On the concrete was painted a broad black line, curving into the main course and forming a "limit line," which was not to be crossed. After making the left hand turn into the main track speed had to be further reduced until beyond the the subway tunnel the "stopping line" was reached. No car was allowed to stop until that point was arrived at. After passing the stopping line drivers turned in at the gate marked G on the plan shown on page 721, avoiding crossing the "limit line" in so doing. The way was then made to the paddock. These new regulations answered admirably, and will doubtless be repeated next season.

The first event was a MEDIUM HANDICAP SWEEPSTAKE over a distance of five miles for cars with engines the cylinder dimensions of which were 104 to 122. Of the nine entrants all faced the starter with the exception of Mr. C. Hobson, who had entered the 1905 Gordon Bennett Brasier. The result was: Mr. O. Cüpper's 48-3-h.p. Metallurgique, 269 yds. start (Owner), 1; Mr. A. Goldschmidt's 48-6 Pipe, 74 yds. (Owner), 2; Mr. A. Huntley Walker's 41-9 Darracq, 925 yds. (Owner), 3. There also ran: Mr. F. S. Edge's 41-9 Napier, 432 yds. (H. C. Tryon); Mr. E. W. Lewis's 48-6 Deasy, 585 yds. (Owner); Mr. E. de Wilton's 45-7 Ariel, 644 yds. (Owner); Capt. W. E. D. Owen's 44-4 Junior, 718 yds. (Owner); and Mr. H. P. MacConnell's 41-9 Rapid, 1,120 yds. (Owner.) After Mr. Huntley Walker passed the Rapid interest centred in the performances of the two Belgian cars, which steadily went to the front, Mr. O. Cüpper's Metallurgique giving a very good showing at an average speed of $61\frac{1}{2}$ miles per hour, and 30 yds. in front of the second.

on the event and in the public enclosure even became enthusiastic. In the paddock the solitary bookmaker was busy also. For this race there were five starters, the result being: Mr. S. F. Edge's 49-9-h.p. Napier (F. Newton), 1; Mr. O. Cüpper's 48-3-h.p. Metallurgique (Owner), 2; Mr. S. F. Edge's 60-h.p. Napier (F. Draper), 3. Also ran: Mr. G. Knowles's 60-h.p. Iris (A. Clifford-Earp), and Mr. E. de Wilton's 57-6-h.p. Ariel (Owner). The Iris was unfortunate at the beginning, and a fierce clutch seriously disturbed A. Clifford-Earp, until towards the end of the course of $3\frac{1}{2}$ miles, when it was too late to get a place. The Metallurgique made a good showing, but ultimately the 49-9-h.p. Napier overhauled the others, and won at an average speed of $77\frac{1}{2}$ miles an hour.

The next event was the best race of the day. It was a PRIVATE STAKES over a distance of $5\frac{1}{2}$ miles and resulted in a very hotly contested struggle, the issue of which was a matter of considerable doubt to the public, who watched the ding-dong running of the Napier and Iris with delight and actually raised a bit of a cheer when it was finished. The keen struggle between the two leaders rather overshadowed Mr. Raymond Dennis, who stuck well to the race to the end, his plucky endeavour proving his racing capabilities, while his car was travelling but slightly slower than the winner. Tryon got away very smartly and was a few feet ahead before many yards had been travelled. Then the cars were almost side by side as they entered the straight. At one point it seemed as though the Iris might be first under the flags, but eventually the Napier won by less than a length of the car at a speed of seventy-three miles per hour.

The last race of the day was the longest on the programme. This was the SECOND 90-H.P. POWER RACE of twenty-one miles, for cars with engines of a cylinder capacity of 225.1 or under. This produced a field of three, but, apart from the high speed of the winner—92½ miles per hour—the event was a procession. Resta steadily increased his lead over the Fiat, which was followed by Mr. Guy Lewin's Hotchkiss, which was missing in one cylinder until towards the end of the event, when the driver of the Fiat, instead of taking the straight, made for the outer circuit, where he was pulled up by the waving of flags.

The summarised results of the meeting give two wins to the 75.9 Mercedes, one to the 48.3-h.p. Metallurgique, the remainder falling to the Napier stable, one of whose cars, that entered in the second 26-h.p. race, was notable because of the removal of the two front cylinders of a six-cylinder engine in order to bring it within the rating formula of the R.A.C. The Metallurgique firm also took two second places.

Four of the winners were fitted with Dunlop tyres and two with Continentals, while four of the events were won on "Shell" motor spirit.

In accordance with the usual practice, a number of the cars which competed in the races were officially measured. The following is a list of such cars, with the official measurements:—Mr. O. Cüpper's 48.3-h.p. Metallurgique, engine No. 888, bore 5.49 in.; Capt. G. L. Hinds Howell's 40-h.p. Iris, engine No. 130, bore 4.998 in.; Mr. S. F. Edge's 60-h.p. Napier, engine No. 3327, bore 4.999 in.; Mr. S. F. Edge's 49.9-h.p. Napier, engine No. 3328, bore 4.563 in. (The h.p. given is according to R.A.C. rating).

Official samples of the petrol used by various competitors were also taken; these will be submitted to chemical analysis, and the results published at a later date.

Sketch plan of the new way the Competing Cars return to the Paddock at Brooklands.

At the Surrey Quarter Sessions, on Tuesday, the General Purposes Committee reported as to the public right-of-way across the motor track at Brooklands. On the advice of the clerk the court had refused to enrol the certificate for the diversion of the public highway in question. Their refusal was made the subject of an *ex parte* application to the Divisional Court by Mr. Locke King, when a rule nisi was granted ordering the Justices of Surrey to show cause why a writ of mandamus should not issue, directed to them, commanding them to direct the Clerk of the Peace to enrol the above-mentioned certificate. The committee stated on Tuesday that instructions had been given to show cause against the rule being made absolute.

A RUMOUR has been current to the effect that, owing to the alleged over-production of automobiles in America, a huge quantity of cars is being sent from one of the largest American factories to England for sale by auction. Mr. P. L. D. Perry, the representative for Great Britain of Ford cars, has just returned from the United States, where he made the fullest enquiries as to the report. The result of his enquiries is that everything would point to the fact that the rumour is entirely baseless; no firm in America have any such number of cars in stock as are rumoured to be coming over here, and no shipping arrangements have been made for sending even the smallest quantity except through various agents in the ordinary course of business. As the Ford car has been specifically mentioned in connection with the aforesaid rumour, Mr. Perry asks us to give an emphatic denial to the report so far as these vehicles are concerned.

CASES UNDER THE MOTOR CAR ACT.

A TRIPLE OFFENCE.

At Stroud Petty Sessions, Albert Hutchings, motor-car driver, of Gloucester, has been summoned for fraudulently using a mark for identifying a motor-car of which he was driver, for having used the car without the same being registered, and for driving the car at a speed dangerous to the public. Mr. A. Lionel Lane, of Gloucester, appeared for the defence and pleaded guilty to all the charges. Defendant took the car, which had been left at the garage in exchange for another, and transferred some identification plates from another car to it. The total penalty for the three offences was £16 ls. inclusive.

HEAVY HAULS.

Twenty-four motor-car cases were down for hearing at the last sitting of the West Riding Court at Doncaster. At Menal Bridge, on the 7th, four motorists were fined. Five chauffeurs have been convicted at Perth for exceeding the legal limit on various roads in Perthshire. Six motorists have been fined at St. Albans. £40 has been obtained at one sitting in fines on motorists at Norton, Yorkshire. At Alnwick, on Saturday, several motorists were fined for excessive driving. Four motorists have been fined £10 and costs at Epsom. £5 is now the usual fine in motor cases at Coventry. A batch of cases against motorists resulted in fines aggregating £20 at Retford on Tuesday.

DANGEROUS SPEED.

H. T. Rowlings was summoned at Brighton for driving a motor-car at a dangerous speed on the King's Road on September 29th. He pleaded guilty. The Chief Constable informed the Bench that on the Sunday in question defendant was driving westwards along the Front at the rate of seventeen or eighteen miles an hour. He (Mr. Gentle) did not represent this as a bad case, and intimated that defendant had been driving for about two years without previous complaint. A fine of 40s. and costs was imposed.

TAKING FRIENDS FOR A DRIVE.

G. T. Shurey, of the King Edward VII. Sanatorium, was summoned at the Midhurst Petty Sessions for driving the sanatorium motor-car at a greater speed than twenty miles an hour, at Cocking Causeway, on September 22nd. He pleaded guilty, but said the offence was unintentional. P.s. Avis said that besides the defendant there were fourteen people in the car. A fine of £10, and costs, 9s., was imposed.

The defendant said he would not be able to pay it.

The Chairman: That's nothing to do with us. You had better make arrangements with your employers. The alternative is two months' imprisonment. No doubt those people (servants at the Sanatorium) who were riding in the car can afford to pay for the pleasure. He was allowed a fortnight in which to pay.

MOTORIST PROVES AN ALIBI.

An unusual case, involving the identity of a motorist, was investigated by the Kingston Bench, when Henry Gwatkin, chauffeur, of Barnes, was summoned for driving a motor-car to the danger of the public at High Street, Esher, on September 28th.

P.s. Stringer said that at night on the date in question he saw a motor-car approaching at a speed of thirty-five miles an hour. He turned the light on the car and called upon the driver to stop, but he took no notice. As the car passed the witness he saw distinctly that the number was LN2,031.

The Defendant: You have made a mistake. I was in Esher in the morning, but not at night, and can prove it. My car was in the garage at Barnes at the time you say you saw it at Esher. My number is LN2,031.

P.c. Matthew said he also saw distinctly that the number was LN2,031. He made a note of it at the time.

The defendant repeated that he was not in Esher on the evening of September 28th, and the manager of a garage in Barnes said the defendant went out with the car on the morning of September 28th, and brought it back at half-past seven o'clock in the evening. It was not taken out again that evening.

The Bench dismissed the summons.

A WARRANT ISSUED.

Brought up on a warrant before Mr. C. R. Kemp, at Lewes Police Court, on Saturday, for failing to answer a summons for driving a motor-car at twenty-eight miles an hour at the Berwick cross-roads on August 5th, Frederick Ingram, of Blackpool, was remanded till Monday. He inquired if it meant that he would be locked up again. Mr. Kemp: Yes, I have no power to grant bail. Prisoner: I wrote a letter answering the summons and I thought the distance would be taken into consideration. Mr. Kemp: You have given the police a great deal of trouble. On Monday defendant was fined £3 and 6s. costs for exceeding the speed limit, and £2 and 6s. costs for failing to produce his licence.

THE ARIEL MOTORS (1906), LTD., have issued a photograph of the certificate gained by the 28-38-h.p. Ariel-Simplex car in the Irish Reliability Trials. The same car also secured a gold medal in the Scottish Trial with 995.4 marks out of a possible 1,000, and the fastest time in its class in all hill-climbs.

THE COMMERCIAL VEHICLE TRIALS.

THE extensive trial of commercial motor vehicles, which had been in operation for five weeks, was concluded on Saturday, when fifty of the fifty-six vehicles which started reached the Vanguard depot, at Dalston, London, N. At that depot the judges have, this week, examined the engines, steering gears, gear boxes, clutches, differential gears, chains, and wheels. The concluding stage of the trial, on Saturday, was from Baldock to London, the routes taken by the different classes varying from 34 miles for the heaviest vehicles to 71 for the lightest. All of the vehicles had mechanical non-stop runs except the 10-12-h.p. Darraq delivery van, which had to have the carburettor cleaned, and lost 71 min., the Thames canvas covered delivery van, which had to have a new petrol pipe fitted, and lost 92 min., the Churchill two-ton lorry, which had trouble with its differential gear and lost 219 min., and the Milnes-Daimler tip wagon, which lost 8 min.

During the tour the vehicles in Class A have covered about 1,540 miles, those in Class B 1,320 miles, those in Class C about 1,210 miles, those in Class D about 1,100 miles, those in Class E about 880 miles, and those in Classes F and H about 660 miles. The actual running days numbered twenty-two. The following vehicles lost no time, either in depot repairs, mechanical or other road troubles:—Lacre one-ton box van, Halley 30 cwt. van, Thornycroft 30 cwt. van, Hallford two-ton lorry, Siddeley two-ton canvas tilt wagon, Straker-Squire two-ton open van, and the Thornycroft two-ton lorry with rim sides. The Mann and Overton "Unic" van lost no time for mechanical trouble or depot repairs, neither did the St. Pancras nor Yorkshire steam lorries.

The vehicles were very severely tested in the hilly country in the West Country and the Pennines and on the rough cobbles of Lancashire and Yorkshire. It is hoped to be able to make known the final decisions of the judges about the end of the current month.

A, tyre trouble only; B, including 128 min. for tyre troubles; C, including 35 min. for tyre trouble; D, lost more than 500 min. on the third day; E, lost more than 500 min. on the third and fourth days respectively and 54 min.; F, including 50 min. for tyre trouble; G, lost 621 min., irrespective of the twenty-first day, which is still under consideration, the vehicle having completed only half the journey; H, including 40 min. for tyre trouble; I, lost more than 500 min. on the fifteenth day and 873 min.; K, lost more than 500 min. on the second day and 479 min.; L, lost more than 500 min. on the fourteenth day and 36 min.; M, lost more than 500 min. on the fourteenth day; N, lost more than 500 min. on the fourteenth day and 511 min.

A fully descriptive account of the trials appears in the "Industrial Motor Review" for October 15th, which was published on Tuesday.

FORTHCOMING EVENTS.

OCTOBER.

- 19th (S.).—Auto-Cycle Club's quarterly trial.
 Birmingham M.C.C. run to Aston Cantlow.
 20th (Su.).—Hill climb at Gaillon.
 23rd (W.).—Annual dinner of the South Devon A.C. at the Royal Hotel, Plymouth.
 26th (S.).—Scottish A.C.'s hill climb near Fintry, Stirlingshire.
 Motor-cycling conference at Nottingham.
 30th (W.).—Annual meeting of the Marine Motor Association.

NOVEMBER.

- 11th-23rd.—Olympia Motor-Car Exhibition.
 12th-30th.—Paris Motor Show.
 13th (W.).—Annual Dinner of the Motor Union at the Hotel Great Central, London.
 22nd-30th.—Stanley Show.
 30th (S.).—Annual dinner of the North London A.C. at the Midland Grand Hotel, London.

DECEMBER.

- 4th (W.).—Southend and District M.C. annual dinner.
 5th (Th.).—Exhibition at Berlin.
 7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.
 18th (M.).—General Committee of the Motor Union.
 21st (S.).—Opening of the Brussels Exhibition.

MARCH, 1908.

- 21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

MR. D. M. WEIGEL'S APPEAL.

ON Tuesday, at the East Surrey Quarter Sessions at Lewes, Mr. D. M. Weigel appealed against the action of the Haywards Heath magistrates, who, in August last, ordered him to undergo one month's imprisonment and suspended him from holding a licence for two years, for driving a motor-car at a speed dangerous to the public, and for refusing to stop when called upon to do so.

Mr. Low, K.C., who appeared for the chief constable of East Sussex, said that, subject to the approval of the Court, he was instructed to make a suggestion which would have the effect of disposing of the appeal. If Mr. Weigel's licence were suspended for the long period named, and a month's imprisonment undergone, he would suffer very large pecuniary loss. Counsel was instructed to submit that the ends of justice would be met by substituting for the imprisonment a fine of £50, and suspending the licence until September, 1908, instead of for two years.

Sir Charles Mathews, on behalf of the appellant, hoped the Court would see the justice of this course. He might say that since August, as a result of the magistrates' action, appellant's firm had suffered a loss of something like £4,000. The Court could therefore imagine the result if the sentence of the Haywards Heath Bench were carried out to the letter.

After a long consultation in private, Sir Albert Bosanquet, K.C. (the chairman), said the Court had considered the matter, and the majority of his colleagues were of opinion that the appeal should be heard. On the application of Sir Charles Mathews, the appeal was adjourned until the January Sessions at Lewes.

POLICE TRAPS.

THERE is a timing arrangement in active operation in the neighbourhood of Warminster, between Bath and Warminster, and sometimes between Warminster and Salisbury.

THE Wigtownshire Standing Joint Committee is providing stop watches for the police.

POLICE activity has lately been marked at Colwyn Bay, particularly in the Conway road, in the direction of Abergelge road.

AT the villages of Woolbeding, Trotton and Cocking police traps have been established, leading to the Midhurst Petty Sessions.

AT Skellow, near Doncaster, the police are watchful of motorists.

POLICE traps have been established between the second and sixth milestones on the North Dee side road, in the parish of Peterculter.

THERE are several motor traps on the road between Malton and York, including a measured quarter of a mile on a steep gradient near the Castle Howard Reformatory.

HORRABY and Kingsmoor, two villages on the main road near Carlisle, have now their motor traps.

SLINFOLD has a new police trap, leading to the courthouse at Horsham.

MOVRIL.

WE are informed that the appeal case has just been decided confirming Messrs. Carless, Capel and Leonard's title to the trade mark Movril for motor spirit. Nearly two years ago, Messrs. Carless, Capel and Leonard introduced a motor spirit, to which they gave the name of Movril, naming it after vril, the mysterious force, which, in Lord Lytton's novel, will enable "The Coming Race" to annihilate time and space and to do a great many other wonderful things, and the root *Mo*, which signifies movement, thus the whole word meaning the vital force of the motor. Messrs. Bovril, Ltd. opposed the application to register the word as a trade mark on the ground that confusion would arise between their meat essences sold as Bovril and the motor spirit called Movril.

The appeal was heard by the registrar of trade marks in December last, and he decided to uphold the mark provided the use of it was confined to motor spirit. Messrs. Bovril did not accept this decision and appealed to the Board of Trade, which has now confirmed Messrs. Carless, Capel and Leonard's title to the word.

AUTO MOBILE ACCIDENTS.

LORD ABERDARE was driving in a motor-car on Saturday from Gloucester to South Wales, accompanied by his chauffeur, when the car skidded within a mile of Chepstow, and collided with a wall at the top of the hill leading into the town. The chauffeur, who was in the rear seat, received an injury to the left hand, but Lord Aberdare escaped with a few bruises. The car was not much damaged.

ON Saturday a motor-car belonging to the Helensburgh Motor Company collided with a lamp-post at Helensburgh, with the result that four passengers were thrown out and injured.

PUBLIC MOTOR SERVICES.

THE cabs to be placed on the road by the British Cab Company will be made by Argyll Motors, Ltd. They will be fitted with the "Garantire" tyre, and the drivers will have liveries supplied by Automobilia, Ltd.

THE statement that the motor-buses of the Birmingham and Midland Tramway Joint Committee have been taken off the road on account of pressure having been brought to bear on them by the authorities is incorrect. The reason they have been taken off is to suit the company's convenience and to be thoroughly overhauled. We may add, on the authority of the Chief Engineer, the buses have just been re-passed by the police and licensed for a further twelve months.

BUSINESS NEWS.

THE DAIMLER COMPANY have just appointed Messrs. Guthrie and Co., Ltd., the well-known firm of merchants, as their agents for the Straits Settlements and Malay Peninsula.

MR. ARTHUR SHIPPEY, of Messrs. Shippey Bros., 13 and 14, King Street, Cheapside, London, E.C., has recently made very great improvements in Rubberrine, and hopes shortly to place on the market for inner tubes an improved compound of a spongy fluid nature which will have great advantages over many puncture proof compounds, with the additional advantage that owners of cars will be able to inject and pump the new compound fluid into their tyres without sending their tyres up to the makers to be filled. A private syndicate is being formed to patent and develop Mr. Shippey's new improvements so as to be ready for the market in time for the early spring trade of 1908.

THE CAR SUPPLY CO., LTD., of 34, Knightsbridge, W., have opened a garage, with private lock-ups, in Notting Hill Gate, where repairs and vulcanising of tyres will be undertaken.

THE new list of the Dunlop Pneumatic Tyre Company, Ltd., for 1908 is now being issued to the trade. Herein are illustrated the grooved and steel-studded patterns of the Dunlop tyre as well as the solid motor tyre for commercial vehicles.

WE are informed by the Fiat Motors, Ltd., that their new works at Wembley will be in full swing in the course of a few days. At the present time the company's stores and machinery are being removed from the old works at Scrubbs Lane, Willesden, into the new building, which will be fitted with all the latest appliances. The factory is best reached from the Sudbury and Wembley station from Euston, and those interested in motoring and engineering will be welcomed by the company's works manager.

THE special car which the new Arrol-Johnston Car Company, Ltd., have built for Lieut. Shackleton's Antarctic Expedition is this week on view at the London depot of the company in Princes Street, W. The vehicle is fitted with a 12-15-h.p. air-cooled four-cylinder engine, and transmission by cardan shaft and bevel gear to a live axle. The exhaust gases are utilised not only to heat the carburettor but also a foot-warmer and a snow melter. Messrs. Stevenson and Company, of Glasgow, have supplied the road wheels, the front pair of which are shod with wood tyres and are so arranged that sleighs can be readily fitted to them. The rear wheels have also wooden tyres fitted with steel projections to increase the traction. A complete set of wheels fitted with Dunlop pneumatic tyres is also provided with the equipment. The vehicle, which appears well adapted for the work it is intended to do, is fitted with a kind of lorry body capable of holding 16 cwt. The petrol tank capacity is equal to about 300 miles running.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, OCTOBER 26, 1907.

[No. 451.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued, and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

DURING the recent labour disputes at Belfast the value of the motor vehicle was demonstrated on more than one occasion, and now the threatened railway troubles have led many commercial men to think of the utility of the automobile for the transport of goods as well as the conveyance of passengers. Several of the leading furniture removers already employ

motor lorries and vans for the conveyance of household furniture over long distances, and Mr. Walter Williams, of Plymouth, promises "a frequent service of powerful motor-cars between London and Plymouth daily in the event of the railway strike." Last week Messrs. Whiteley carried out what is probably a record in furniture removal by motor-van, the whole journey of about 120 miles from Hounslow to Leicestershire being undertaken by a motor pantechicon. Inquiries among several firms in the London motor trade point to the fact that many leading commercial houses are already securing chassis for adaptation to the purposes of their business.

An Official Hint.

IN our last issue we made reference to the seasonable opportunities now provided for owners of property, land, &c., to trim hedges, and in so doing help to secure the safety of users of the roads.

Almost simultaneously with our Comment the Local Government Board have issued a circular letter to the County Councils drawing attention to the unfortunate fact that many such bodies have not exhausted their powers of erecting signposts of a warning character to motorists. They rightly point out that a more extensive use of such posts might tend to materially diminish risks attendant upon traffic on the roads, and suggest that great improvements might be effected by cutting off the corners in a road. It is frequently possible for the County Council by agreement with the owners of the property adjoining the highway to arrange the removal of such obstructions, and the L.G.B. have done well to emphasise these points in the circular which we reproduce on another page.

Sergeant Waghorn "Scouted."

SOME idea of the extent to which the Brighton road is used by motorists was gleaned on Saturday in connection with the inquiry by the L.G.B. inspector into the application of the East Sussex County Council for fixing a motor speed limit of ten miles an hour on that portion of the main road between the

thirty-third and thirty-fourth milestones from London to Brighton in the village of Handcross. Rev. H. R. White said that the number of cars passing through the village on Sunday afternoon averaged 300. Then Sergeant Waghorn, of Lewes, who was described as "the greatest authority on timing motorists in England," referred to the working of the electrical timing apparatus, and told how the scouts of the Automobile Association tried to thwart his trapping motorists. They shadowed him at Lewes, and wherever he went they went. There were 500 yards of cable in connection with the timing apparatus, and, of course, the scouts kept a sharp look out to see when a car was stopped. But for the scouts the police would make many more captures. Mr. Rees Jeffreys said that Handcross had only one policeman, and he had nine miles of ground to cover. More police should be put on on such an important road. On this point, of course, opinions will differ, but probably the Association will reprint Sergeant Waghorn's testimony to the value of the scouts in economising the expenses of motoring in their next circular. Of 163 motors and motor-cycles timed by the sergeant at Handcross on a recent day, only ten were proceeding at a pace that he thought deserved magisterial consideration.

Successful Appeals.

THE Motor Union were successful last week in winning three appeals to Quarter Sessions against magisterial decisions. A very interesting appeal at Surrey Quarter Sessions was that of Sir Henry Norman, M.P. Summoned for driving to the danger of the public, he was fined by the Guildford County Magistrates, although the police admitted that there were neither vehicles nor pedestrians on the road when Sir Henry Norman passed over it. The police further stated that they did not know into what fractions of seconds the dial of their watch was divided. The second success was in the appeal of Mr. J. H. Armytage to the Surrey Sessions. In this case the Godalming justices had imposed a fine for driving to the public danger. The speed was given as just over twenty miles an hour, but one of the constables stated that nobody was in any danger. The officer who held the watch admitted that the only way in which anybody could have been in danger was that something might have gone wrong with the mechanism of the car. The successful appellant at Southampton was Mr. J. E. Wimshurst, a member of the New Forest and Hampshire Union. A small boy ran into the car, which was proceeding along High Street at about six miles an hour. He sustained slight bruises, and was taken home by Mr. Wimshurst. The police prosecuted upon the information of two young workmen; the parents did not interest themselves in the occurrence. Yet Mr. Wimshurst was fined £5 and costs.

The Trade Outlook.

MOTORISTS have so long been familiar with the varying attitude of the general Press of the country towards their Movement that they are not likely to be drawn into the ditch of pessimism in which the "lay" journalist would drag the motor industry. According to this very luminous person the whole business is in the nadir of despair, and the leaders of the trade are as anxious as the Irish peasant to leave their present location. Rumours of failures, arrangements and suspensions are so frequently set afloat that we open our "Gazette" with an uncomfortable feeling, and we walk along the avenues of motor-car showrooms with an air much resembling that of Macaulay's New Zealander. If the man who knows nothing about the subject is asked for his view of the automobile outlook he calls to mind something he has read in his favourite sheet, and answers "Ichabod." In fact, this attitude of mind has been so sedulously cultivated in some quarters of late that the motor industry would seem to have taken the place of agriculture as an example of national depression. We would not be so optimistic as to suggest that everything is wholly well with the industry, but we would raise a protest against the wholesale pessimism of certain sections of the Press.

A Motoring Touring Party near the East Gate, Chester.

The Hope of 1908.

THE truth is, that, guided by the prosperous expansion of the business that followed the 1906 season, the trade naturally looked for a continuance of good things. But the climatic conditions that prevailed in the early part of the year militated against any such development, and as the weather vagaries continued throughout the year the hopes of any recovery steadily receded. Many makers have accumulated stocks owing to the restricted demand, which has made the situation embarrassing in many ways. In many countries of the Continent a corresponding tendency has been noted, adding to the general perplexity of the situation. These facts have been magnified and greatly exaggerated, to the disadvantage of the industry, and, if continued without some such note of warning as we are uttering being given, are likely to cause a withdrawal of capital that will still further complicate the position. Of course business is quiet now, and those who frequent the exhibition next month are not likely to do much to infuse a more cheerful hue to the outlook. This is a waiting period, but the feeling of slackness must not degenerate into despair. Two such unseasonable years as 1907 rarely come together, and, given anything like fair weather conditions next spring, the Agricultural Hall Exhibition will, as

in former years, inaugurate the selling season in a way that will dispel many of the clouds now undoubtedly hovering about the trade—shading its prospects, perhaps, but not entirely submerging its future prosperity.

A Motor Mentor.

IRRATIONAL persons are so fond of writing to the papers with regard to the speed of automobiles, that the busy motorist is becoming less and less inclined to take notice of correspondence on his pastime in the daily press. Not often do those who rail at motor-cars express themselves so sensibly as Mr. L. T. Hobhouse has done in a letter to the "Economist," in which he sets forth a series of hostile suggestions with such a show of reason that they deserve some consideration, although no endorsement, from motorists. He suggests that motor-car accidents should be the subject of official investigation in the same way that those which take place on railways are examined, and that local authorities should have greater discretionary powers over the automobiles passing through their districts than is at present the case. Cars should, according to Mr. Hobhouse, be compelled to carry a speed indicator at the rear, which should make clear to the public when a speed of more than fifteen miles an hour was attained, such to be the general limit, to be reduced to ten miles an hour, however, in towns and villages. Apparently Mr. Hobhouse has failed to grasp two points upon which motorists are almost universally adamant in their views, viz., that a speed limit of any kind is bad from every point of view, and that there must be uniformity of administration throughout the country.

Two Essentials.

PERHAPS a re-statement of our view on these matters may be useful at the present juncture. Experience has proved what motorists believed years ago, that speed does not necessarily constitute danger. Given a long stretch of highway with a few schools and cross-roads upon it; then suggest a car of high speed capable of being throttled down almost instantaneously; in such a case the motorist might travel at twice Mr. Hobhouse's suggested limit without danger, and quickly slow down at his discretion to avoid risk at points where traffic was likely to be present. Surely that is all that is required. Why unnecessarily limit the rate of travel, and so inferentially restrain the endeavours of inventors to attain mechanical perfection? On the second point, with regard to uniformity. In traction engine practice, where licences are issued by county authorities, the difficulties have proved so great that we would regard with apprehension any proposal to allow similarly varying regulations as to motor-cars. But with one central authority and a law administered in the same degree throughout the country, the motorist would, at least, not have the excuse of want of knowledge of his legal position.

Magistrates on Traps.

COVENTRY magistrates, who have had some experience of the trapping of motorists by the police, are beginning to recognise that these methods are often subversive of justice instead of accessories to its administration. A recent big haul of victims caught in a trap at Allesley enabled the magistrates to scoop in £15 for the funds of the Court and also gave the occasion for a little lecture to the police. The chairman of the Bench said that he and his fellow magistrates had come to the conclusion that the distance measured for the purpose of checking too fast motoring should be more than a quarter of a mile. He declared that a stop watch might not be absolutely reliable for such a short distance, and went on to say that the magistrates believed that by timing over a longer distance better results would be obtained. While not committing himself or his merry men the police inspector promised

to give the matter consideration, and the magistrates will go on fining.

On the Great North Road.

THOSE who know the Great North Road are perfectly acquainted with the safety of many miles of the same from the public point of view. Whole stretches can be seen right ahead, and the 20-mile an hour limit reached without risk to anyone. The authorities, however, are becoming watchful, and at the last meeting of the Doncaster Rural District Council, Mr. Batty (Wadworth) proposed that the attention of the county authorities be called to the excessive speed of motor-cars, particularly on the Great North Road, and suggested that the magistrates should increase the fine from £5 to £50. Mr. Spedding seconded the motion. Mr. Butler (Askern) said a police-sergeant told him that during the race week motor-cars travelled on the Great North Road within two

brief tenure of office. He had travelled much, and had done some good work in various walks of life—literary and charitable among the number. In the latter connection he organised the matinee of the Savage Club in aid of the Lord Mayor's Crippled Children's Fund last June, and as this year's Master of the Savage Club Lodge he was gaining the esteem of an increasing circle. We offer to his family our sincere condolences on the loss of a genial and widely-respected friend. The funeral took place at Hammersmith on Thursday.

The Circulation of the Dollar.

THIS has been a record season for American motor-car tourists in Europe, according to a report recently made to the American State Department by Mr. E. R. Mansfield, the American Consul at Lucerne, Switzerland. He estimates that 8,000 motor-cars have been in use this season by Americans touring in Europe, who spent on an average £80,000 a day.

The above illustration depicts the 30-40-h.p. Fiat Car, with Limousine body, which has recently been supplied by Fiat Motors, Ltd., to Mr. and Mrs. Seymour Hicks.

Mrs. Hicks, who, of course, is better known as Miss Ellaline Terriss, is seen at the wheel. The new car replaces a 20-h.p. model of the same make which was purchased three years ago. In the background is seen the Old Forge, Merstham, the picturesque country residence of this popular couple. It derives its name, we understand, from a smithy which has been a feature of the pretty village since the days of the Norman Conquest.

Photo by

(Foulham and Banfield, Ltd.)

feet of each other at the rate of 40 miles an hour, and it was impossible to stop them. Mr. Kellett (Bawtry) said that a fine would not stop the nuisance—nothing short of six months' hard labour would do it; while yet another speaker advocated toll bars. The motion was carried. Cannot something be done to challenge the exaggerations of these irresponsible persons who would indict a whole nation on the follies and shortcomings of a few equally irresponsible persons?

The late Mr. Kingston.

ALL his old friends, as well as the many new admirers he had gained during his short period of work as secretary of the Motor Club, will regret to hear of the death of Mr. Holmes Kingston, on Saturday last, after a few days' illness. Mr. Kingston was one of the most accessible and agreeable of secretaries, his urbanity winning him a host of friends in the Motor Club, to whose fortunes he contributed greatly during his

"Each motor-car carries on an average five persons," Mr. Mansfield writes, "making a total of 40,000 Americans motoring on the Continent. The expense will average £2 per day for each person, making a daily expenditure by this class of American travellers in Europe of £80,000. The American automobilist usually spends two months on the Continent, which brings the aggregate expenditure up to £4,800,000 for the season."

THE Somerset A.C. has offered thirty-six regulation red triangle danger signs to be erected and maintained by the Somerset County Council on main roads at dangerous corners and cross-roads. The offer has been accepted.

THE value of the motor-cars and parts exported from the United States during the eight months ending with August last is returned at £950,402, as compared with only £667,284 in the corresponding period of 1906. England heads the list as being America's best customer, this country being responsible for £292,894 of the total, Canada being second with £207,258.

MOTOR TOURING IN DENMARK.

MANY ardent motorists have by now fairly well exhausted the beauty spots and places of interest in France, Germany, Switzerland, and Austria, and when a Continental motor tour is suggested they sigh for fresh fields and pastures new. Recently we had an opportunity of a most interesting chat with Consul Strelitz, of Fremantle, Western Australia, who has been touring on his 30-35-h.p. Daimler both in England and on the continent for the past four months. Amongst other countries visited, Mr. Strelitz spent a considerable time in Denmark, and speaks very highly of the roads, the beautiful scenery, and the country generally, and strongly recommends his fellow motorists not to neglect that small though interesting country at the southern end of the Baltic.

The arrangements made by Mr. Strelitz with regard to his visit to Denmark were as follows:—He shipped his car from Harwich to Rotterdam, and then motored to Hamburg, and from the latter town went north by way of Kiel, Schleswig, Flensburg, Apenrade, Hadersleben, and Christiansfeld, which town marks the Danish frontier. Here the German number plate is given up, and in about 200 yards the Danish Custom House is reached. At this point the papers relating to the

At Korsøer there are eleven sets of railway lines to be crossed and heavy sand to be ploughed through on leaving the boat, but a judicious "tip" to the sailors results in the laying down of planks in order to get the car over those obstacles easily. Great improvement may, however, be hoped for shortly in this respect, as the Danish Minister of Railways has promised that alterations shall be made.

For the return journey to Copenhagen the road through Kjøge is followed to Marnasund Station, where the car has to be put on the train, the railway company being advised the day before to have a truck in waiting for this purpose. The vehicle must be ready for shipping at 10.30 a.m., and be consigned through Warnemünde. Excellent arrangements are made for loading, and the car can be driven on to the truck. It is best for the motorist to travel by the same train as the car to ensure its despatch. The train then proceeds as far as Gjedser, where it is put on the largest train ferry in the world, and, after a trip of two and a-half hours, Warnemünde is reached. During the crossing the luggage and papers are examined by the German Customs officials. On arrival the motorist proceeds to the express goods shed, where he receives his car, pays the freight, &c., and then goes, escorted by an officer, to the main Custom House, where the necessary formalities have to be gone through before obtaining the German number.

A View of Lake Como, near Varenna, Italy.

A Tunnel on the Road near Alassio, between San Remo and Genoa.

TOURING ON THE CONTINENT.

[Allgemeine Automobil Zeitung.]

driver and the car are examined, and a printed form is given to the motorist, directing him to report himself at the Town Hall at Kolding, where a statement has to be made in writing, setting forth the length of the tourist's intended stay in the country, the engine number of the car, the horse power and weight of the vehicle, the English identification number, and the number of the English driving licence. A permit is then obtained from the inspector, with two number plates, which are fixed in the front and rear of the vehicle, for which a charge of about 4s. 6d. is made. An official seal is then painted on the car in red, and the automobilist is advised to look where this device is placed, as a favourite position is the centre of the door panel.

On these formalities being gone through, Dr. Strelitz went to Frederica, and here took the ferry to Middelfart. This crossing occupies some fifteen minutes, and the charge is about four kroner. On disembarking great care should be taken, as the way is very narrow until the main road to Odensee is joined. After this Nybourg was aimed at over a splendidly-made and wide road. From here the ferry to Korsøer is taken, and great care is needed in getting the car on board, as the approaches to the boats are bad. Alterations are, however, now in progress.

Mr. Strelitz states that no motoring is permitted in Denmark either before sunrise or after sunset; that all except main roads are closed to motor-cars, and that intending tourists should obtain the road map issued by the Automobile Club of Denmark, showing the highways on which motoring is allowed. This association, he says, is most courteous, and will help the motorist in every way possible. Our informant also advises that extreme caution should be displayed on the road between Flensburg and Nybourg, as the inhabitants are so frightened of motor-cars that at the approach of one they lose their heads, and an accident may occur if extra precautions are not taken. There is a speed limit of 30 kilometres per hour in the country and 16 kilometres in Copenhagen, and, though police traps are not unknown, little is said about any excess provided no one is endangered. The language need not deter the visitor, as English is spoken by all the officials at the frontiers, and on the ferries.

Finally, Mr. Strelitz says, "Go to Denmark; you will have fine roads, lovely scenery, some of the best motoring obtainable, and to do the country thoroughly you only require about a fortnight; and last, but not least, the hotels are excellent and very reasonable in their charges."

THE TRADE POSITION ON THE CONTINENT.

(FROM A SPECIAL CORRESPONDENT).

FRENCH newspapers, sporting or otherwise, have not published any of the details concerning the well-defined crisis through which the automobile trade is passing at the present moment. They may have most excellent reasons for not crying aloud regarding the hard times which are now upon French motor-car traders. Certainly one or two articles have appeared in which the word "crisis" is decried in favour of the word "evolution," as appeals are made to makers to find new markets, to study home conditions, or to reduce their prices as the case may be. What is more certain is that 1908 will see an immense reduction of prices all round. As a *ballon d'essai* the Panhard people have published their tariff for 1908. This fact alone might make people fairly sure that knife edge competition is to be the order of the day, since French constructors are by no means usually so ready with their prices before the Show opens.

It is only last week that rumours were made known that a well-known Italian company were in difficulties, a fact little surprising to those who know the state of things in industrial Italy. Whether the crisis in the last-named country is the result of over-production, or whether the poor state of the Italian motor-car factories is simply due to the unsatisfactory condition of trade, is a detail that will appear in the sequel, but it has been an open secret for some time that many of the Italian works would close their doors during the coming winter. It is the old cry in Italy—lack of ready cash cripples expansion just at the moment when expansion is most necessary, as in the case in point, for with their fine examples of chassis and the cheapness of labour in Italy it is certain that Italian cars would be able to find a vent in a remunerative export trade. There will be some interesting questions to study in the development of Italian trade in the near future.

Not only in Italy is the pinch of hard times being felt, as will soon be seen. In Switzerland the few factories there are working on reduced output and very reduced personnel. German firms have been unable to increase their export; in fact, the figures show that German exports are less than in 1906. German development, however, has not presented the phenomenal character during the past two years that has occurred in France, as the recent article in the *M.C.J.* has shown. If the crisis is to be keen it will hit France hardest of all Continental countries manufacturing motor-cars or parts.

There are some commercial men in Paris who do not hesitate to foretell that the over-production in the motor-car industry will entrain a corresponding depression in the metal trade in general, and that six months will not elapse before this depression will be more than apparent. At the present moment, however, motor-car firms are doing their best to keep up appearances until the *Salon* will have run its time—the tenth, and most brilliant of all French shows to date. Thus, facts which would otherwise have come to light are being shaded as far as possible; the following are, however, among the rumours and facts which are now steadily gaining credence in the Paris clubs. The bodywork factories are working under a very reduced regime, both as regards staff and hours, and, whilst some are in actual difficulties, one at least has suspended operations. As regards the factories for chassis and motors, eight-hour days are the rule in place of ten, which are commonly worked before the Show, while, in the case of two or three firms, it is reported that operations have temporarily ceased.

MR. I. F. PALMER, of the Kingston Motor Works, High Street, Kingston-on-Thames, has a large stock of tyres and non-skid bands, from which he is prepared to send supplies to any place on receipt of news of a breakdown. His place is situated on the Portsmouth road, and this information may be of service to motorists journeying thereabouts.

THE WHITEHEAD MOTOR TYRE AND DETACHABLE RIM.

WE illustrate herewith the novel motor tyre and detachable rim which has recently been devised by Mr. A. W. Whitehead, of Glebe Terrace, Far Headingley, Leeds. As will be seen, in place of a single continuous inner air tube Mr. Whitehead fills up the circle of the tyre with a series of segmental tubes, each equipped with its own valve and enclosed in an ordinary outer cover. The segments are flat ended and abut closely against each other; as already mentioned, they are each provided with their own valve, the use of an inflator with indicating gauge being recommended in order to ensure that the segments are all pumped up to the same degree. The ends of the segments are guaranteed to withstand the air pressure even when one is punctured. In order to facilitate the removal and replacement of a damaged segment, Mr. Whitehead has also devised the new detachable rim shown below. From the latter it will be observed that the rim is provided with six key-hole slots which allow it to be placed in position by the nuts of the bolts which are fixed in the felloe being passed through the holes. On a partial turn being then given to the rim the

bolts enter the slots and on tightening the nuts the whole is held securely together in the form of a complete wheel. The felloe is provided with a series of slots to allow the valve spindles of each segment to be moved laterally into or out of position. To remove or replace a segment the nuts are slackened, a partial turn given to the detachable rim, which is then removed; the nut on the valve spindle is then slackened, when any segment can be drawn sideways out of the rim without the aid of levers. The advantage claimed for the arrangement is that when a puncture takes place only one segment is deflated, and there is no occasion to stop to repair it, as the tyre does not go down. Mr. Whitehead, indeed, states that there is no bumping even if several of the tubes are punctured; he informs us that he has given the new tyre a lengthy trial on a 30-h.p. four-cylinder Argyll car, on some of the worst roads in Yorkshire and Lancashire, with satisfactory results, and that the outer cover, detachable rim and inner segments can be taken off in seven minutes.

DURING the Olympia Show "The Motor House" will hold a special non-reserve auction sale on November 21st, starting at 3 o'clock p.m. This will be additional to the ordinary non-reserve sale that will be held on November 7th.

A SEASIDE PUBLIC SERVICE.

A POPULAR feature in the Folkestone district during the past summer season has been the public service of motor-cars, run by Messrs. Albregt and Mead, motor engineers, High Street, Hythe—four services per day in each direction between Hythe, Dymchurch, New Romney, and Littlestone. A regular connection has also been maintained between Hythe, Sandgate, and Folkestone, while on Wednesdays a special service was run between Hythe and Rye. We are able to illustrate two of the vehicles used by Messrs. Albregt and Mead. Special interest attaches to the machines, inasmuch as they have been built by the firm from parts of other cars. Thus the first char-a-banc in the picture was re-constructed out of a 24-35-h.p. Dietrich touring machine, using the same engine and gear-box, and building them into a new pressed steel frame of the firm's own design. The back axle is built up with nickel steel stub-ends and channel steel. The wheel base is about 12 feet, and tangent wheels are fitted. Seating accommodation is provided for 24 persons, and an important point is that the total weight is well under 2 tons, enabling the vehicle to run up to the 20-mile limit. The second car is an 18-22-h.p. Daimler, rebuilt in the same way as the other one, but having accommodation for only 20 persons. The firm inform us that they have

SOME USEFUL NOTES.

AS soon as the tread of an outer cover wears down until the fabric is exposed the tyre should immediately be removed and sent to the factory for retreading. Otherwise the fabric will soon be destroyed and the tyre permanently injured in consequence. When imbedded in rubber and not subjected to strains or weakened by bending, the fabric used to reinforce the tyre will retain its strength indefinitely. As soon, however, as the rubber is removed and moisture from the road is permitted to penetrate the fabric it begins to disintegrate and in an incredibly short time its strength and resistance is gone for ever.

BLISTERING and cracking of the finished surfaces of motor-carriage bodies is often hastened by the practice of leaving cars unnecessarily long in the direct rays of the sun, and especially is this the case when the varnish is not perfectly hard before being put into service. When a vehicle has been spattered with mud, and is then left standing in the sun for a long time, the effect is especially bad, as the mud becomes literally baked into the varnish, particularly if the latter is not perfectly hardened. In the process of washing the sun-dried mud requires an unusual amount of sopping to remove it, and is very likely to leave a dull surface beneath it. It is suggested to owners of new or newly-

Two of the Public Service Vehicles in use in the Folkestone District.

a special form of springing, which, while being very flexible for light work, is also suitable for extra heavy loads. The smaller machine has been on the road between Folkestone, Hythe and Littlestone-on-Sea since last March, and has done upwards of 10,000 miles, besides long country runs to Hastings, Tunbridge Wells, Ramsgate, &c., the day's run frequently extending to 120 miles.

AN English edition of Krausz's Practical Automobile Dictionary in English, French and German has just been issued by Messrs. Iliffe and Sons, Ltd. The work, which comprises over twelve thousand technical terms and words employed in connection with motor-cars and motoring, is stated to have achieved considerable popularity in America. While the dictionary will doubtless be found useful by many interested in automobilism in this country, careful revision will be necessary ere it can be said to thoroughly fulfil its purpose from a British point of view. For instance, such terms as advance fire, aluminum, clutch lever, gasoline, gasoline throttle, ground wire, motor case, non-slip tyre, speed lever, and starting crank are hardly terms in current use on this side of the Atlantic. The German section of the book appears to have been well done, but the French portion, like the English, might with advantage be carefully gone over before a second edition of the dictionary is put in hand.

varnished cars that they refrain from using them until the varnish is thoroughly set, and that, when the car is to be left standing, it preferably be upon the shady side of the roads, under trees, or in the shadow of buildings. After driving in the mud it is very desirable that the car should be washed before being exposed unnecessarily to the baking action of the sun's rays. When the first gloss is worn off and the finished surfaces have hardened completely, precautions of this nature are of less importance, but a little care in this direction will make the "new" appearance of the car last longer than will otherwise be the case.

Too great care cannot be taken with a new car to determine that the lubrication is working properly. The factory trial may have been made with a test body which carried the mechanical lubricator, and the apparatus supplied with the car may never have been tested more than very cursorily. There is nothing more convincing than disconnecting the oil pipes from their discharge points and observing if the lubricant is feeding all right when the engine is running.

WHEN leaving a car for any length of time unattended, or on putting it away for the night, the ignition should be switched off, the petrol cock closed, the ignition lever retarded to the proper point for starting, the change-gear lever placed in the neutral position and the hand brake put on.

CONTINENTAL NOTES.

The Gaillon Hill Climb.

The annual hill-climbing competition over the flying kilometre was held at Gaillon on Sunday, the event attracting a large number of entries, of which no less than sixty-five put in an appearance. The touring class was dealt with first, three of the sections being won by British-built vehicles, all these being shod with Dunlop tyres, viz., Bright, on a 6-h.p. Rover, in the single-cylinder 125 mm. max. bore category (2 min. 51 4-5 sec.), Miss Dorothy Levitt, on a Napier, in the 91 to 110 mm. bore six-cylinder class (49 sec.), and Glentworth, also on a Napier, in the over 111 mm. bore six-cylinder section (35 1-5 sec.). In the racing section the honours went to the six-cylinder Napier, driven by Newton, the car making not only the fastest time of the day (26 2-5 sec.), equal to 84½ miles per hour, but winning the class for vehicles of any size or power. Sir R. Gore,

out of the sixty-seven entries, sixty-three faced the starters. The cars have to make seven rounds of the circuit, which is being guarded by soldiers. Eight of the competing vehicles have two-cylinder engines, the remainder having single cylinders, the majority of which are 100 mm. bore by 120 mm. stroke. As a result of the first day's trial seven cars were eliminated, the list of troubles comprising a broken cardan shaft, seized cylinder, damaged axle, broken chain, collapsed wheel, &c.

The 1908 A.C.F. Grand Prix Race.

The Sporting Commission of the French Automobile Club has now officially announced that next year's race for the Grand Prix will probably be held during the last week in June or the early part of July. The rules will be those drawn up at the international meeting of Ostend, viz., a maximum cylinder bore of 155 mm. for four-cylinder motors, or an equivalent piston surface for motors of the six or eight cylinder types. The

The Gaillon Hill Climb.—A View at the Starting Point.

on a Mercedes, was second in 31 3-5 sec., and Rigal, on a Darracq, third in 34 4-5 sec. The record for the climb stands to the credit of Mr. A. Lee Guinness, who last year drove the 200-h.p. eight-cylinder Darracq over the course in 25 sec.

Motor-Car Speed in France.

The activity of the recently-formed Societe Protectrice Contre les Exces de l'Automobisme is attracting considerable attention in French motoring circles. The chief object of the new body seems to be to secure the imposition of an extra tax on all motorists, in order to provide a fund whereby everyone who is injured or whose property is damaged by a motor-car shall receive an indemnity. Naturally considerable opposition is being shown to the movement.

The Coupe des Voiturettes.

The seven days' reliability trial of light cars, over a 33·8 kilometre course, commenced at Rambouillet on Monday, when,

minimum weight of the cars in running order must be 1,100 kilog. (2,420 lb.), without including either water, petrol, or spare parts and tyres, but with oil in engine base and gear-box.

French 1908 Models.

The Peugeot Company has just issued its 1908 programme. Eight different models are to be made, viz., 9-h.p. single-cylinder, live axle, 10-h.p. twin-cylinder, chain-drive, 12-h.p. four-cylinder with either chainless or chain transmission, 18-h.p., 24-h.p., and 50-h.p., all having four-cylinder engines and side-chains, and a 60-h.p. six-cylinder chain-driven vehicle. Except as regards the 50-h.p., which will be slightly reduced, the 1907 prices are being maintained.

Austria as a Touring Country.

After France, Austria is perhaps the finest touring country in Europe. It is full of the most beautiful mountain scenery, with pine clad hills and forests, and an abundance of picturesque

lakes and rivers. There are delightful old towns and country districts where the peasants still wear the gorgeously quaint costumes of the eighteenth century. It is also the sportsman's paradise. There is no such varied shooting within a limited area anywhere else in the world, and the fishing is excellent. Hotels and inns abound, and are always clean and well-managed and moderate in price. The food is simple, but invariably of good quality and well prepared, light and pure, and cheap, too.

French Exports of Motor Cars.

At the meeting of the French Chambre Syndicale de l'Automobile in Paris last week, the President announced that the exports of motor-cars and parts from France during the eight months ending with August last had attained a value of £4,168,640, an increase of £300,000 over the corresponding period of 1906.

Miscellaneous Items.

The Gas Motoren Gesellschaft, of Deutz, Cologne, is taking up the construction of motor-cars.—It is announced that the business of the Sud-deutsche Automobilwerke, of Gaggenau, is

THE 1908 DE DIETRICH CARS.

MESSRS. JARROTT AND LETTS, LTD., inform us that the old-established firm, the Société Lorraine des Anciens Etablissements de Dietrich de Luneville, are producing for 1908 no less than five different models, ranging from 14-h.p. to 70-80-h.p. Appended is a list of the different sizes:—14-h.p., four cylinders; 18-28-h.p., four cylinders; 20-30-h.p., four cylinders; 28-38-h.p., four cylinders; 40-50-h.p., four cylinders; 60-80-h.p., four cylinders; 70-80-h.p., six cylinders. All the features which have made the De Dietrich so successful in the past have been retained in the 1908 models, and several improvements have been added as a result of long tests and experiment. Considerable interest will be centred on the 14-h.p. car, which will have a live axle in place of the usual side chains. The 18-28-h.p. can be supplied with either chain drive or live axle to the choice of the customer. The chain-driven cars are fitted with a direct drive to the countershaft on both third and fourth speeds. Each type of chassis is made in two lengths to accommodate carriage work of all descriptions. The 14-h.p. is also made with a down-swept frame in order to bring the rear part of the car nearer the floor

The Gallion Hill Climb.—Newton on the Six-Cylinder Napier.

being acquired by Messrs. Benz and Co., of Mannheim.—A proposal to establish a public motor-car service between St. Estephe and St. Vivien, *via* Loirac, France, is at present under consideration.—No less than thirty-four motor-cars, thirty-seven motor-cycles and eighteen motor-wagons were employed in connection with the recent military manoeuvres in Italy.—A number of electric motor fire engines are to be purchased for the Fire Brigade of Crefeld, Germany.—The municipal authorities of Cambrai, France, have fixed the speed of motor-cars at seven and a half miles per hour, and have forbidden the use of sirens.—The Automovil Club de Guipuzcoa, North Spain, has been renamed, and in future, by permission of the King of Spain, will be known as the "Real Club Automovilista de Guipuzcoa." The new president is the Duke of Sotomayor.—The Dutch agents of the Fiat Company—Messrs. Verwey and Lugard, of The Hague—have lately shipped a 12-18-h.p. Fiat car to Sumatra for the transport of the mails between Deli and Tebing Tinggi.—Some trials with a Durkopp petrol motor fire engine have lately been made in Barcelona.—A public service of Darracq-Serpellet steam vehicles has just been inaugurated between Lannemezan and Magnoac, France, by La Société des Auto-Transports.

line and obviating the necessity of the usual two steps to mount into the carriage. This feature is particularly advantageous in the case of town carriages. Owing to the very great demand for the De Dietrich car it has been found necessary to establish factories in the following places:—Luneville, Argenteuil, Milan and Birmingham. These factories are all equipped with the most modern plant, specially adapted to the purpose of automobile construction, and are already organised and producing large quantities of cars. All the models are made in the Continental factories with the exception of the 20-30-h.p., which is produced in Birmingham, and has been specially designed to suit English requirements. It is fitted with a powerful four-cylinder motor, four speeds and reverse, selector gears with a gate quadrant, direct drive on high speed to the rear live axle. The frame is kept low in order to facilitate mounting into the carriage, and is upturned at the rear to give full play to the springs and back axle. The clutch in all the models is of the metallic disc type, which has been found so satisfactory in the past.

HER MAJESTY QUEEN MARGUERITE of Italy, who is the possessor of several motor-cars of various makes, has just purchased a "Wolsit" 10-h.p. car.

THE Motor Union's moral support is to be given to a member in an action against a firm for supplying alleged defective tyres.

MR. HUNTLEY WALKER'S stud of racing cars are included in the sale by auction which Messrs. Hampton and Sons are holding on the Brooklands Track to-day (Saturday).

ARGYLLS, LIVERPOOL, LTD., are organising a day trip to the Olympia Motor Show about the 14th of next month, for the drivers of Argyll cars in their district.

MESSRS. HANCOCK, WRIGHT AND CO.'s garage in Orville Street, Battersea, contains a car for the service of motorists who have broken down in the neighbourhood.

AUCTION sales of motor vehicles will be held by Mr. C. M'Adams in connection with the motor business he has taken over from Mr. W. Truscott, at Nelson Street, Bristol.

WITH reference to the Lymington route to the Isle of Wight, referred to in our last issue, we learn that more than three hundred motor-cars have been conveyed that way during the present year.

MESSRS. DENNIS BROS., LTD., Guildford, have sent us a drawing of the design they have got out for a petrol motor prison van. The body is adapted to be fitted to the Dennis standard 'bus chassis.

WITH regard to the proposed Motor Trade Benevolent Fund it has been resolved by the Council of the Society of Motor Manufacturers and Traders to recommend the committee to come to some arrangement with the cycle trade fund.

THROUGH the instrumentality of the Motor Union the tolls charged for motor-cars and motor-cycles crossing Hayling Island Bridge have been placed on a more satisfactory footing. The toll is now fourpence each way for an ordinary touring car, and one penny each way for motor-cycles.

MESSRS. ARGYLLS, LTD., have entered a 12-16-h.p. (by R.A.C. rating, 17.5-h.p.) four-cylinder Argyll motor-cab for a petrol (Pratt's Borneo) consumption test under the Club's observation. The test consists of a run of about two hours in London traffic and of about three hours in the country.

THE committee of the Bath Road Club have decided to discontinue the Ripley Roadmenders' Dinner Fund. It is proposed to devote the balance of the fund in hand as a donation to the Surrey Convalescent Home at Seaford. The entertainment of the men working between Richmond and Guildford was started in 1889.

RECENT orders for steam wagons secured by the Yorkshire Patent Steam Wagon Company include one from the Edgar Mayall Motor Transport Company, Mossley, one from the Irwell Motor Transit Company, Manchester, one from Mr. L. Winterburn, carrier, Oldham, and one from the Hoyland Nether Urban District Council.

SIR ALBERT K. ROLLIT has promised to open the forthcoming Stanley Show. The thirty-second annual dinner of the club will be held in the Hotel Metropole on Saturday, the 16th prox., and the invitation smoking concert which is annually given by the Stanley Cycling Club will be held on November 7th in the Queen's Hall, London.

A 20-h.p. Scout car belonging to Mr. R. C. Baker, of Barford St. Martin, near Salisbury, was in the Shrewsbury railway accident. On examination the car was found to be without the slightest damage, owing to the fact that it was packed so well in the fish van. Unfortunately the driver of the car sustained somewhat serious injuries. He was accompanying the car from the north of Scotland on his return journey.

Now that duller and cooler days are coming upon us, motorists will do well to consider the means available for keeping frost out of their motor houses. Messrs. C. Toope and Sons, the well-known heating engineers and experts of Stepney Square, Stepney, London, E., have given the matter much study during recent years, and are well able to advise upon the subject. Their catalogue will be of assistance in suggesting plans for dealing with the difficulty by gas, oil or coke.

CAPTAIN CRESSWELL, who has recently had his licence suspended, has no further use for his 40-h.p. Itala car, and is disposing of the same.

FROM the Dunlop Rubber Company, Ltd., of the Manor

Mills, Aston, Birmingham, comes an attractive catalogue of their motor clothing, to which we made reference in our issue of the 5th inst.

MESSRS. LOWE AND WOOD, LTD., automobile engineers, of Broad Street, Birmingham, have sent us a photograph of Miss Isabel Jay seated in the Spyker landaulet which they recently supplied to this well-known actress.

FIGURES taken from the New Zealand Customs statistics show that 357 motor-cars were imported into the colony in 1905. In 1906 410 cars were imported, of which 178, valued at £25,707, were of foreign construction, and 232 cars, valued at £40,335, were of British make.

THE forty acres of lawn surrounding the Capitol building, in Washington, U.S.A., are now cut by a petrol motor lawn mower, run by one man, and costing £300. Three days are required to cover this amount of ground, whereas it formerly took two weeks, employing from twelve to fifteen men.

The 16-20-h.p. Delivery Van lately completed by Argylls, Ltd., for railway service in Mexico.

WHILE the King of Spain was motoring on Sunday through the flooded districts in the province of Lerida, a temporary bridge which had been thrown across a river near Pons collapsed as the royal car was crossing it. The King fell into the water, but happily escaped with no worse consequence than a wetting.

AT the Engineering and Machinery Exhibition at Olympia, W., which closed on Saturday last, Messrs. Drummond Bros., Ltd., of Ryde's Hill, Guildford, had an interesting exhibit of their small lathes specially designed for motor repairing. The tools are so arranged that they can be readily adapted for re-boring cylinders, re-bushing gear cases, and similar work.

THE Imperial Car Cleaner is a new preparation for cleaning and renewing the surface of metal, leather, and woodwork of motor-cars. It is claimed by the American Agencies, Ltd., 38, Shoe Lane, E.C., who are introducing it to motorists, that the Cleaner is harmless to varnish, while, at the same time, renewing its lustre. Dealers in second-hand vehicles, as well as private motorists, should appreciate the merits of this renovator.

MR. J. S. BROWN, of Swansea, has rendered the Chief Constable every possible assistance in getting the chassis for the motor ambulance for the town, and kept it in his garage for some considerable time. The body is now being built upon the chassis by Messrs. Wilson and Stockall, of Bury. The ambulance is to be fitted with all the latest improvements, including heating with water and hot water basins inside, &c.

THE new car badges of the R.A.C. will be ready for members of that organisation on the 1st prox.

THE Maudslay Motor Company have just completed a fine 35-45-h.p. limousine for the Duke of Sutherland.

THE Wolseley Company are building a motor-van for the G.P.O. for service between London and Aylesbury.

MESSRS. STRAKER AND SQUIRE, LTD., have recently sold a 25-30-h.p. Straker-Squire C.S.B. car to H.H. the Maharajah of Bikanir.

THE business of Messrs. Sayers and Co., 90 and 92, Wandsworth Road, Vauxhall, S.W., will in future be carried on by the Automobile Carriage Builders, Ltd., at the same place.

MESSRS. WELTE AND OWENS, LTD., the Liverpool and district agents for the Hotchkiss and Vulcan cars, are establishing a motor accessory department in connection with their depot at 16-20, Colquitt Street, Liverpool.

UP to Thursday last week the 40-h.p. six-cylinder Napier, which is at present undergoing a 3,000 miles trial, using Simcar benzol as fuel, had covered 2,100 miles. The amount of benzol consumed, was 93 gallons 4 pints 2 ozs., giving an average of 22.5 miles per gallon.

THE police committee of the Board of Supervisors of San Francisco, U.S.A., has directed the preparation of an ordinance requiring all persons who desire to operate motor-cars within the limits of the city and county to pass an examination as to their proficiency. The regulation will also require that all motor-cars be fitted with an apron to prevent oil or grease from dripping on the streets.

WE illustrate herewith an attachment for motor-horns which has recently been put on the market by Mr. Walter Williams, motor engineer, 79, Old Town Street, Plymouth. It

consists of an addition to an ordinary horn by means of which the latter can be operated either by an electric buzzer or the usual reed at will. The attachment is so made that it can be adapted to any make of horn.

MESSRS. ARCHIBALD GRAY AND Co., of 34, Quarry Street, Guildford, have now further extended their business by taking over the premises lately occupied by Messrs. Phillips Bros., Cycle and Motor Factors, at 94, High Street. Here they are showing a large stock of tyres and motor accessories, and have opened a booking office for the hire of cars. This branch, together with their Quarry Street depot, is open day and night, including Sundays.

MESSRS. HODGKINSON AND Co., of Devonshire Road, Bexhill, have now taken up the manufacture of the Eyre anti-skid. The device has recently been improved by the adoption of loops made of twisted hemp cable of considerable strength, and covered with a spirally-wound casing of galvanised iron wire. Should this casing, after some use, show signs of wear at any part, sufficient to expose the cable, the portion affected may be removed and a new piece of wire bound on in its place.

So much has been heard in recent years of the wonderful new battery which Edison had invented, and which was to revolutionise motoring, that a good deal of scepticism is now shown whenever the subject is mentioned. This week the daily press has announced that at a meeting of the Electro-Chemical Society a few days ago Mr. Edison stated that in the course of experiments extending over three years he had decided that a battery capable of furnishing power for 12,000 miles was not superior to the horse. Therefore, he had made a battery "with a capacity of 50,000 miles before being re-charged." We await with interest further particulars of the new accumulator.

THE Westminster Palace Hotel, opposite the Abbey and Houses of Parliament, has now its motor garage.

THE chauffeur to the Bishop of Liverpool has been fined for driving to the danger of the public at St. Helens.

TENDERS are invited by the 28th inst. for the supply of three motor-omnibuses to the Metropolitan Asylums Board.

IN North Street, Glasgow, the St. Vincent Motor and Cycle Company, Ltd., have a well-arranged and modernly equipped garage.

A HORSHAM farmer has been summoned by the police for not clearing the clipping of his hedge from the road—a salutary warning to others not to be similarly negligent.

MESSRS. MACRAE AND DICK have a garage in Academy Street, Inverness, capable of dealing with 200 cars. A newly equipped repair shop has been of convenience to many motorists visiting the Highlands recently.

THE Health Resort Bureau have published an interesting volume on Wintering in Rome, by Dr. A. G. Welsford and Dr. G. S. Brock. The reference to the facilities in the city for motorists will be of interest, and the whole book of use to those who are likely to be going to Italy for the benefit of their health.

THE Scottish Automobile Club have arranged to hold a series of examinations for driving and mechanical proficiency certificates, to be granted by the R.A.C., in the principal towns throughout Scotland, towards the end of November. Forms may be had from the secretary, Mr. Robert J. Smith, C.A., 163, West George Street, Glasgow.

NEXT year an international exhibition will be held at Shepherd's Bush, London, W., which will be known as the Franco-British Exhibition, and a strong list of officers has already been secured. Many well-known experts in various branches of science, art and industry have consented to be chairmen of the principal committees, and only exhibits of genuine British and French manufacture will be admitted. Applications for British exhibits should be made before the 15th proximo, to the organising committee, at 56, Victoria Street, London, S.W.

RECENTLY a 15-h.p. Talbot car laden with six adults ascended the Water Wynd at Fife without a hitch. Mr. Baxter, of the Dundee Motor and Cycle Company, Ltd., Dundee, had been in the district with the vehicle, when the ability of the car to take a full load of passengers up the Water Wynd, with a gradient of about 1 in 4, was challenged and accepted by Mr. Baxter, who twice made the ascent along with his driver and other passengers. On the third occasion three extra adults were taken on board, and, with a start of about twenty-five yards on the level from the foot of the Wynd, the car ran up with surprising ease. The car arrived at the top in the High Street much to the surprise of the large crowds of townsfolk who expected the vehicle to "stick in the brae."

THERE has recently been published, simultaneously in Paris (Messrs. Boyveau and Chevillet) and in London (Mr. A. Siegle), a Dictionnaire Anglais-Français et Français-Anglais des Termes et Expressions usités dans l'Emploi et la Construction des Bicyclettes, Motocycles, et Automobiles. The dictionary, which extends to 368 pages, is the work of Mr. W. E. Bayles, who has evidently devoted considerable time and trouble to its compilation, the terms in both languages, so far as we have tested them, being correctly given. Furthermore, a plan, as novel as it is useful, has been adopted, which should render the work extremely popular not only amongst those engaged in the automobile industry, but with motorists generally. Mr. Bayles' method is, in the English section, to devote the left-hand pages to a list of words and their French equivalents. The right-hand pages are reserved for a brief explanation in French of the meaning of the principal English words, and, in smaller type, short phrases showing the actual application of a particular word. In the French section the same plan is adopted, not only the equivalent but the meaning of French words being given, as well as short phrases introducing the different terms. The dictionary should form a useful addition to the reference library of motorists and motor traders, especially of those having connection in any way with France.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-28, Charing Cross Road, London, W.C.]

TRADE COMPETITORS IN CLOSED CLUB EVENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I beg to enclose you herewith a copy of a letter I have sent round to the secretaries of the various provincial clubs, nearly all of whom have communicated with me in regard to the trade competing in closed club events. In most cases the various committees are arranging for the framing of rules dealing with the whole subject, and I am hoping that in consequence the club competitions of next year will be much more interesting to the private owner.

I am sending this copy on to you in order that you may know exactly what has taken place. I myself feel that the whole matter is one which the Competitions Committee of the R.A.C. should have taken in hand and dealt with, because a real grievance undoubtedly existed, and many secretaries were not sufficiently "au fait" with what was taking place elsewhere to know how to deal with it.—Yours truly,

CHAS. JARROTT.

COPY.

Dear Sir,—With reference to my last communication, it may perhaps interest you to learn that I have now heard from the secretaries of practically every provincial club in the United Kingdom on the question of trade competitors in the closed club events. Many clubs already have

affected, as the private owner who drives in club competitions for the sport of the thing will not continue to do so when he stands at such an unfair advantage. Signs are not wanting that such is already the case, as, though my club has a large membership, I have had the greatest possible difficulty in getting a respectable entry from my members, the reason being in every case that members had not the slightest chance against the pot-hunting trade members, and, therefore, would not enter. As you are well aware, it is an impossibility to keep a provincial club together unless you have competitions; it eventually means, unless this practice can be stopped, that provincial clubs will in due course cease to exist. The thanks of all private owners in the country are due to you for the excellent lead you have given, and I am sure the support you will get will show what a real grievance this practice has become.

And thus, having laid the matter as clearly as I can before you, I need say no more. If, as a result of my first communication, the sporting side of automobilism is assisted, then the value of each automobile club is increased.—Yours faithfully,

CHAS. JARROTT.

RACING AT BROOKLANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with astonishment the letter by Mr. Huntley Walker in which he states that no other car but the Napier has any

The Commercial Vehicle Trials.—The Judges Inspecting the Dismantled "Unic" Delivery Van.

rules satisfactorily dealing with the matter. With two exceptions there is a strong desire on the part of the committees that the private owner should be encouraged to take part in these club events, and as a matter of interest to you I am setting out the various methods adopted to secure this end.

1. The division of all club events into two classes:
 - (1) Private owners. (2) Trade members; or
2. The passing of a rule compelling all members to take part in, say, four club runs before being eligible to compete in any club events; or
3. The entire barring of trade members from club events; or
4. The rule that club events are open only to club members residing within a twenty-five mile radius of club headquarters.

In addition to the above, I find several clubs adopt the very excellent precaution of putting on club entry forms a statement, to be signed by the member, that the car entered is his own bona-fide personal property. Another excellent suggestion I have received is that a rule should also be passed by each club "that no entrant in a closed club event shall directly advertise the performance accomplished by him or his driver. Obviously this prevents the manufacturers entering directly through one of the staff of the firm.

That the necessity for proper legislation has been felt by, nearly all the provincial clubs is fully borne out by the following extract from a letter I have received from the secretary of a flourishing Northern club:—"The matter you raise is of the greatest importance and affects all provincial clubs; in fact, if the practice is not speedily put a stop to, a considerable number of clubs, including my own, will be seriously

chance of success on Brooklands track, as Napier cars are specially built and the cylinders of such large dimensions that they just fit into the different classes. I entirely fail to see the correctness of this statement. At the meeting held on September 14th my 48.3-h.p. Metallurgique ran successfully in the 60-h.p. race, where it secured third position, beating two 60-h.p. six-cylinder Napiers, one 57-h.p. Darracq, and two 51-h.p. Minervas. At the meeting on October 12th my 48.3-h.p. Metallurgique was first in the Medium Handicap, my 25.6-h.p. car was second in the 26-h.p. race, being only a few yards behind the winner, and my 48.3-h.p. was second in the 60-h.p. race, where it was by far the smallest car, and competed again successfully against the much bigger 60-h.p. six-cylinder Napier, 60-h.p. Iris, and 57-h.p. Ariel. These performances I think certainly prove that a small motor may score over a bigger one, and there should be no reason why other competitors should not take part at Brooklands if they have the same confidence in the efficiency of their motors.—Yours truly,

OSCAR CUPPER.

THE BRITISH AIRSHIP AND FOREIGN ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Obviously your correspondent is an enthusiast in the cause of all-British motors, and I suppose that his enthusiasm does him credit. At the same time, he can hardly expect that everyone will agree with what he writes unless he is able to substantiate his statements. It is tolerably apparent from Colonel Capper's action in choosing a French engine for the army airship, that our friends abroad are still holding

their own, and it would appear to be an incontestable fact, which unhappily any amount of letter writing will not alter. Evidently the all-British firms have not made the rapid progress that was expected, but perhaps the British engineers whom your correspondent mentions will do what they can to design for next season an engine which can be regarded as superior to its foreign competitor.—Yours truly,

C. W. BRETT.

MOTOR TRAPS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The part championed by police authorities against motorists in the administration of the powers vested in their hands is carried to extremes. The spirit of administration is bad, this leads to the training of the policeman to practise measures which are repugnant.

Motorists make up a highly respectable assembly, whose loyalty to their king and country have placed their cars at the disposal of the State (in case of necessity). Should such a loyal body be prosecuted with malignity, unreasonably, by the accepted standard of magistrate, who administers law with hatred? Let the Bench remember that the policeman is a man of very little education. His training consequently cannot be one of the same standard as that of his educated countrymen, in whose ranks are associated some of the best men of the day.

It is astonishing to find the result of speed to be responsible for so few accidents as compared with the remaining portion of the traffic of the road. This demonstrates that many motorists brought before the bench are not the criminals, or class of criminals, who are to be abhorred, and treated with such severity. Is there an Act of Parliament which has been so abused or strained by police authorities as the present Motor Car Act?

The 30-40-h.p. Ariel-Simplex Carlton Limousine Landaulet recently built by Ariel Motors, Ltd., to the order of the Rt. Hon. Lord Digby.

Does it not point to the want of integrity by those who practise a method which goes against the great lesson which every child is taught from his cradle? What are the present tactics building up? The disrepute of the police authorities, assisted by a Bench who believe in the infallibility of the untechnical policeman. A visit to the motorists' camp will show that half the convictions are shown, by their protest, to be wrong and prejudicial.

Do we live in an age when law retards the progress, commercial facility, and genius of man?—Yours truly,

W. T. LALONDE.

THE COURTESY OF THE ROAD.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I beg to bring before your notice an incident which occurred on the 17th inst. in Oxford Street. I was travelling westward towards Marble Arch on a cycle, on the near side, within a yard and a half of the kerb; coming from Marble Arch was a motor-cab, which passed an electric standard on the off side in the direction in which it was running, which was the wrong side. The driver then turned into Park Street very sharply, and took the west corner within one and a-half yards of the kerb, which was on the wrong side; he ran into my machine three-quarters of the width of the road from the eastward corner. I am not proposing to discuss the right and the wrong of the case as to the accident itself, but what I strongly condemn is the driver's action after knocking me down, that instead of stopping and making a humane inquiry as to any mishap that may have occurred to me, he, without the slightest hesitation, raced down Park Street as fast as ever his engine would take him. The passenger, a lady, in the cab at the time stood up and seemed rather anxious, but whether she endeavoured to stop

him or not I cannot say. I wrote to the company owning the vehicle on the same evening asking them to make enquiries, but up to the present moment have not received the mere courtesy of even an acknowledgment of the letter.

I would like to point out that, being in the motor business myself, I am in no way prejudiced against cars, but this accident has very naturally upset my judgment in the matter of motor-cabs, and it is hardly to be wondered at that there are many people walking about to-day who are in strong disfavour of motor-omnibuses and motor-cabs, due to accidents of a similar nature.—Yours truly,

S. J. WATSON.

POLICEMEN AS PILOTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The suggestion of Mr. Bryan Scurfield, of Manchester, recently referred to in your columns as to a new society being formed to take charge of young school children as they emerge from school and safely pilot them through the traffic, is interesting. This is already done at Leicester. At each opening and closing of the schools the police officer on duty in the locality has to be at the principal entrance for ten to fifteen minutes, and not only does he control the traffic, but he safely pilots the little children across the road in batches of a dozen or so at a time. I may add the police officer is often assisted by the school caretaker or "handy-man."

The idea is well worth copying in rural districts, and policemen would be thus better employed in safeguarding the juniors than trapping their elders.—Yours truly,

A. B. E.

SOME INTERESTING EXPERIENCES ON A SMALL CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Nowadays we only seem to hear of six-cylinders and 24-80-h.p. cars, &c.; the small car seems quite out of it! Quite recently, however, I decided upon making a fairly long trip from the south coast on a small car, just to see what would happen. I started with a friend about 1 p.m. from Bexhill-on-Sea, after first listening to ascertain if all the cylinders were firing properly, and proceeded to Lewes via Pevensey and Polegate. The road from Bexhill and Pevensey is very bad, being very twisty and narrow; we kept going nicely, however, on top speed in spite of a big head wind. About two miles from Pevensey "something did happen"; the engine "died." Not possessing an instruction book to guide us as to "what to do in a case like this," we decided to look for ourselves, and soon found that the petrol pipe had broken and the petrol was pouring on to the road. Once more we thought of the instruction book, and, as before, had to do without it. My friend, who was a member of the medical profession, had an idea—we all do sometimes; he cut a piece of good rubber tube from his stethoscope, with which we united the broken pieces, and ran on till we got to a diminutive and very countryed blacksmith's establishment, where we properly soldered up the pipe.

We had quite an uneventful run to Lewes, having been passed only by the long-distance six-cylinder Hotchkiss. Having had a somewhat late lunch at the White Hart, my medical friend left me, having first presented me with about three inches of stethoscope rubber, in the event of another breakage of the petrol pipe. So I proceeded alone on the little car, making for Guildford via Haywards Heath and Horsham. A perfect run to Haywards Heath, hardly ever coming off top speed, and never by any chance below the second. Taking in a little petrol at Mr. Wood's establishment I ran easily on to Horsham. Five minutes' stop there to buy picture postcards, and then straight on to Guildford. Two miles from Horsham the English climate asserted itself, and a violent rainstorm threatened to drench me, so I stopped to put on my *parapluie*. Nearing Guildford one cylinder showed signs of missing, but I decided not to trouble, so I pattered on and reached Guildford about 8.35 p.m.

Proceeding next morning about 10 o'clock towards Reading, I had gone about one and a half miles when I stopped—that's all—just quietly stopped. Inspection revealed that the petrol pipe had again broken, and further examination revealed the interesting fact that I had lost the doctor's parting gift of the stethoscope tube. Result, a walk to Guildford with the broken pipe, another repair and many spare pieces of rubber tube; delay one and a half hours altogether. After losing my cap once, and the road about three times, I got within measurable distance of Reading, when, curiously enough, the petrol pipe again broke, in spite of the flexible rubber joint. Having temporarily repaired it, I renewed the pipe entirely in Reading, making it with two rubber joints, to be extra specially flexible. Leaving Reading in a rain storm about 3.45 p.m. I proceeded to Oxford via Wallingford, and about ten miles from Oxford I beheld a motorist stopped at the summit of a hill with the bonnet of his car open. It has been said that it is motor-car etiquette to ask as you pass if any help is required, because by the time the answer is given you will be far out of hearing. In this case, however, I stopped as the gentleman looked so lonely, and I was sure he had forgotten the book of instructions. His engine (a three-cylinder) would apparently only run for about five seconds, so, having asked him if he had done all the usual things in such cases, such as blowing up the back tyres and adjusting all the brakes, tightening up the clutch spring, &c., and he stated that he had, I chanced (another

idea) to suggest that he should try one of my accumulators (I had two). Of course I knew it was an absurd thing to do, but mine looked much nicer than his; they had nice red and black terminals, and his looked quite different—no colour about them at all! Curiously enough, his engine seemed to run quite well on mine, and I stood and thought I remembered Sir A. Conan Doyle's work concerning a famous detective, and, taking to heart some of the hints contained therein, I carefully scrutinised the now exultant motorist, and, after closely examining his boots, watch chain and necktie, and the very tidy state of his hair, I came to the conclusion that he was unmarried, had at least £2,000 a year, and lived alone in a mansion with nothing but cats for companions. I considered my deductions good enough, so let him proceed with my battery. Some people who tell amusing tales, and never by any chance deviate into the paths of truth, tell us of the man who is stranded and borrows a battery or a tyre, and neither the man nor what he borrowed is seen again. So far I have not seen this gentleman again, but I hope to, as he will doubtless tell me if my deductions were correct; but the battery, I am pleased to state, was sent off from Reading as soon as he got there almost, and if this should meet the eye of the gentleman in the mansion with the cats, let him accept my best thanks for his prompt dispatch of my accumulator.

Having arrived at Oxford about 7 p.m. and met a friend, we decided to proceed to our destination—Broadway in Worcestershire—that night, and accordingly left Oxford at 8.15 p.m. The road to Woodstock is perfect. A bit hilly to Chipping Norton and very much so from Chipping Norton to Moreton, where we stopped for refreshment. The weather for an English summer was magnificent; we both had good thick winter coats, and even then the blazing fire at Moreton was very welcome. Leaving Moreton about 11.30 p.m. with the headlight going, we proceeded to Boughton-on-the-Hill, which hill we flew up—that is the way all motorists go up a steep hill—on second speed. Having climbed this mountain we drifted along, and soon after passed down the Fish Hill into Broadway. A most enjoyable run, and one which proves that small cars are quite capable of doing a fairly big journey with no difficulty and at a minimum of trouble and expense. The petrol consumption was approximately 35 miles to the gallon.—Yours truly,

DARMENITE.

P.S.—I quite forget to mention that the car was a little 5½-h.p. two-seated Oldsmobile with two speeds.

AN OPPORTUNITY WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the article in the *M.C.J.* referring to the designs of motor-cars, and as this subject has interested me for some time, probably there will be no harm done if I mention that if I were given a fortnight in any motor-car manufactory I would design and work out ideas to specifications of two types of cars, one for general pleasure use and a 'bus that would satisfy the most fastidious for comfort and elegance, and, with reference to the 'bus, one that could easily be turned within the distance required by the authorities, and quite safe with reference to skidding.

I am not writing for a cheap advertisement, but as a poor inventor without friends in the industry.—Yours truly,

INTERESTED.

THERMO-SYPHON WATER CIRCULATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you would answer a few questions as to the thermo-syphon system of water circulation in petrol cars. How is the syphon principle applied to circulate the water in an automobile; that is, how are the water tank and radiating coils located so that the principle will work properly? Has heat got much to do with its working?—Yours truly,

NEW RECRUIT.

[The thermo-syphon system of water circulation is simply the natural circulation. The tanks and radiator are fixed above the level of the cylinder head with the return pipes below the water level. The supply is taken from the bottom of the radiator, or the tank, into the cylinder, and kept circulating by the heat, the hot water passing upward into the top of the radiator; in fact, it may be said that the system depends entirely on the heat for its operation.]

CARBONISATION IN ENGINE CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I had occasion recently to dismount my single-cylinder engine, and on getting the piston out found that the top of it was covered by a hard layer of carbon, fully a ½ in. thick. I should be glad if your or any reader of the *Journal* could tell me what is the cause of the deposit, and also whether it is any detriment to the engine developing its full power. Also what steps should be taken to prevent the deposit recurring.—Yours truly,

W. HUTCHINSON.

[The principal source of carbon deposit in cylinders is excessive lubrication, sometimes aided as a secondary cause by too rich a mixture; but the carbon deposited from the latter is dry and powdery, and does

not appear to harden into a compact layer without the aid of excessive oil. The cause of too much oil passing the piston may be worn or stuck rings, or in a new engine a want of perfect fit that will remedy itself in the course of a few hundred miles running, while occasionally the non-functioning of the air escape valve from the crank case (De Dion, Darracq cars, &c.) promotes the trouble. The deposit on the piston need not affect the power if the valves are kept clean, but it is not beneficial to the cylinder; it is sometimes hard enough to be positively abrasive, and if present to the extent described by our correspondent is a symptom of one or more of the above mentioned defects, which should, of course, be attended to. Moreover, the presence of much deposit in the cylinder is often a cause of pre-ignition, refusal to stop on switching off, &c.]

LOSS OF COMPRESSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having had a similar trouble as Mr. W. P. Loft mentions in a recent issue, perhaps these few lines may be of service to him. Has he had his valves fitted properly? A good many motorists, not only motorists but repairers also, will grind in a valve, and look at the head of same for a result. I have had four engines of the same make give the same trouble, with the compression so bad that, after grinding the valves in, the engine could be turned over with the little finger. I remedied them with a cutter.

If he has the old valves by him, and has them put in the lathe, no doubt he will find them bent, which may have started his trouble and caused an irregular surface on the valve seat in the cylinder. He may fit a good many valves and still find no compression, if the seat is not true. Supposing the seat itself is only touched at one point by the valve when being ground in, it will show a mark all round the valve,

A Churchill Char-a-banc which has done good service at Felixstowe during the past season.

but not so in the cylinder. Clean off at the seat and see if that shows the same; that is the place to look to, not so much the valve.—Yours truly,

AITCH EMM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad if you or any reader of the *M.C.J.* can tell the reason why there is no compression on my De Dion 9-h.p. single-cylinder car. The inlet valve is all right, as it will hold petrol. The exhaust valve has been ground in, so that is all right. I have put two new rings on the piston, and I am quite sure it does not get past there. The car works all right, but does not take ordinary hills on top speed owing to the loss of compression.—Yours truly,

T. EVANS.

[The loss of compression, as explained by our correspondent, is probably due to the piston rings, and it is past these that the loss occurs. It is a mistake to imagine that new rings will fit perfectly gas tight in a cylinder until they have had a considerable amount of running, and got thoroughly worn into their bearing. If the rings are taken out and examined, it will probably be found that they are only bearing for a portion of their circumference, the bearing points being either side of the joint and directly opposite. After the engine has had a good running the difficulty ought to be overcome.]

IGNITION WIRE.—"H. J. M." writes:—"Can you inform me where I can obtain high and low tension wire for wiring a car, covered with flexible brass or lead, suitable for Indian climate?"

THE makers of the "Peg-sus" detachable non-skid and motor-tyre protector are Messrs. Middlemore and Lamplugh, Ltd., of Holloway Head, Birmingham.

A SUGGESTION FOR INCREASING THE SAFETY OF STEERING JOINTS.*

By LOUIS T. WEISS.

AN unusual number of motor accidents have occurred in the United States recently, and in most cases we read that the steering gear broke, or that the car, when going at high speed, became unmanageable, or the driver lost all control of his vehicle, or the car first headed for one side of the road and then for the other, finally landing upside down in a ditch, or succeeded in smashing itself to pieces on a stone wall, tree, telegraph or other pole. In most of these cases one or more lives were lost. There can exist but little doubt that the statement "that the car became unmanageable" is correct in many of the sad occurrences. The Technical Committee have had no opportunity to examine any cars after accidents had taken place, and if such opportunity had presented itself, they would have proved of little value since the cars are mostly a general wreck. We have, however, examined and considered the steering gear now in general use, and believe that it is certainly faulty. It is surprising that manufacturers furnish such a mechanism when they well know what must result on its breaking down while in use. The kind of steering gear which we speak of consists of the hand wheel, worm gear or nut movements, which causes the steering crank to swing in a vertical plane. This crank is connected to the steering knuckle by means of a reach or connecting rod swinging in a horizontal plane, and it is to this rod we wish to draw serious attention.

Since the steering crank A moves in an arc of a vertical plane, and the steering knuckle (not shown) in an arc of a horizontal plane, it is necessary that the connecting rod B be so made as to allow for up and down, and at the same time, sideways or lateral, motions at each end. A convenient way to accomplish this is to have the ends of both cranks ball-shape, as shown at F in sketch. The sockets CC partly encircle the ball end F of crank A. The springs DD exert a pressure tending at all times to keep the sockets CC in close contact with the ball F. The nut E in some cases enters the tube B as shown, and in others screws around the outside of that tube. This tube generally has an oblong hole cut into its side large enough to allow the ball end, together with the two sockets, to

move freely and longitudinally in the tube B, thus forming a yielding and play-less connection between the crank A and the steering knuckle. A yielding connection is very desirable, since it prevents snapping off of the steering knuckle, as well as lengthens the life of the irreversible steering mechanism proper.

The mechanism proper, such as the worm and gear, or the nut and thread, as well as the steering knuckles, are generally very well proportioned and well made. With the reach rod, which is just as important as the rest, it is different. When assembling, the ball F is entered through the opening X, and can come out the same way if the sockets CC open. Then the rod B will fall to the ground, and all connections between the hand wheel and the front wheels of the car are broken, and the vehicle runs wild. The sockets CC will open when either of the springs break, and break they will, as the writer has personally removed one spring in three parts.

It is true that some makers of cars make the opening buttonhole shape, and others slit it all the way out to the end, so that the ball can only be entered from the end, or through the large part of the buttonhole opening, and, when in place, these are covered or closed by a nut or cap, which at the same time answers the purpose of compressing the springs, as does E in the sketch. We have then an opening through which the ball cannot pass and the rod cannot drop off. We have examined such connections and found some where the thin wall of the tubing had been worn so large that the ball passed through easily. Others were so that the blow of a fist forced the rod off.

In the accompanying sketch we show a primitive, but quite an effective way to prevent the dropping of the rod if the springs should break so that the car will not run wild. The writer has taken such precaution ever since he has run motor-cars, and has, as before stated, removed one spring in three pieces. After the break the wheels wobbled somewhat, but the car could still be steered.

We do not recommend this particular method of drilling a hole and drawing a wire through it and round the tube B in all cases, since some steering cranks and knuckles would be weakened too much by the hole. We do, however, believe it to be a very wise precaution to fasten the

parts either by wire or other means, so as to prevent the reach rod from falling, jumping, or being jerked out of connection if the sockets CC should separate.

ROAD REPORTS.

LLANDUDNO.—The President of the Local Government Board has issued an order under the Motor Car Act, 1903, restricting speed to ten miles an hour in the following thoroughfares in Llandudno:—So much of the Parade as extends from its junction with the North Parade to its junction with Vaughan Street; and so much of Mostyn Street as extends from its junction with Gloddaeth Street to its junction with Vaughan Street.

FRECKLETON MARSH.—The road across Freckleton Marsh, which is the most direct route to Lytham, is liberally strewn with loose macadam, the surface of which is injurious to motor tyres. Those who have had occasion to traverse it after nightfall lately must have been in fear and trembling lest a nasty gash in the tyre should be sustained in this isolated region. Many travellers on pneumatic tyres prefer this coast route to Blackpool to the new main route via Kirkham, but it is to be feared that, owing to the present condition of the marshes, a great deal of traffic has been diverted to the main road and the toll receipts affected in consequence.

TAUNTON.—The Taunton Chamber of Commerce is urging the town council to fix boards warning motorists to drive slowly at the borough boundaries on all the main roads.

FORRES.—Restriction of the speed of motor-cars to ten miles an hour has been sanctioned by the Secretary for Scotland in several streets of the town of Forres.

LOSSEMOUTH.—Last week the roads and streets in the burgh received their annual patching; several other main highways in the district were also dealt with.

KINGSTON.—The main London road and Richmond road in the borough of Kingston-on-Thames is under repair.

BEDFORD.—Portions of the following main roads within the borough of Bedford will most likely be under repair during the next two or three months, viz., Kimbolton Road and Ampthill Road.

FINCHLEY.—Finchley and Hendon have each agreed to contribute one-third of the estimated cost, £5,700, of a bridge, to carry the road between Mill Hill and Finchley where it crosses the river Brent, near Dollis. It is stated that the Highways Committee of the Middlesex County Council will recommend that the remainder of the expense be defrayed by the county.

INVERNESS-SHIRE.—The Road Board of the County Council of Inverness-shire have recommended proposals to widen the highway near the entrance to the Falls of Foyers, the cost to be borne by the British Aluminium Company; to have the Gleann Meadail branch road, in Knoydart, taken off the list of highways, and to apply for a grant for township roads in South Uist and Barra. These recommendations have been approved by the council.

DONCASTER.—Small portions of the main roads in the Doncaster district are being made good where worn, but no great disturbance of motor traffic is resulting.

BRIDGWATER.—With regard to the main roads here there is a length of about two to two and a half miles of roads through the borough, and the times of repair are somewhat erratic owing to the surfaces being so constantly disturbed for gas, water, post office, telephone and electric lighting purposes. Mr. F. Parr, the Borough Surveyor, is to be congratulated on the condition of the streets under the many adverse circumstances.

LEICESTER.—At the present time none of the main thoroughfares in Leicester are blocked for any work, the tramways scheme having been completed. In connection with the repair of any macadamized roads in the borough of Leicester, Mr. E. George Mawbey, the Borough Surveyor, always sees that only one half of the road is dealt with at a time, so as to leave a sufficient width in all cases for the passage of traffic. This is, we are glad to note, a practice that is becoming more general throughout the country.

MESSRS. JOHN E. GIBBS AND MACLEAN, LTD., of Fawcett Street, Fishergate, York, have designed a new burner for Serpollet and other steam cars, in which the heavy gun metal casting that was originally used in these burners has been done away with.

MR. ARTHUR GOODWIN, who has had a long connection with the motor trade, has joined the firm of Messrs. C. A. Vandervell and Co., of Acton Vale, W., and is taking charge of the commercial side of the business. Owing to the development of their trade in accumulators and ignition accessories Messrs. Vandervell are, we learn, arranging for a large extension to their works.

AMONGST the newcomers in the tyre section of the forthcoming show will be Messrs. George Spencer, Moulton and Co., Ltd., of 77, Cannon Street, London, E.C., and Bradford-on-Avon, Wilts. This firm is one of the oldest rubber manufacturers in England, but have hitherto confined their efforts to the making of their well-known india-rubber buffer, draw and bearing springs, &c., for railway rolling stock. Their experience on railways will now be turned to automobilism, and some of their new tyres will be on exhibition. It will, however, be some months before the new machinery they are putting down at their mills will be ready to turn out tyres on an extensive scale.

* Abstract of Paper read before the Long Island Automobile Club.

CLUBS AND ASSOCIATIONS.

SCOTTISH AUTOMOBILE CLUB.

A PARADE of commercial motor vehicles took place on the afternoon of Thursday of last week, organised by the Scottish A.C. The vehicles met in Blythwood Square, Glasgow, and after being examined by the judges, proceeded at a comparatively slow pace over a selected route embracing the principal streets of the city, the whole course covering a distance of about five or six miles.

The following members of the Competitions Committee acted as judges:—Mr. John Adam, convener, Mr. Wm. Reid, Mr. Wallace Fairweather, Mr. John M. Ross, Mr. George F. Paisley, Mr. J. B. Talbot Crosbie and Mr. J. B. Shanks.

On the return to the place of start Mr. John Adam, convener of the Competitions Committee, in awarding the money prizes to the drivers of the vehicles, explained that the prizes were given solely in respect of the condition of the vehicles and of the engines and to the evident care displayed by the driver in looking after these, and without any regard whatever to the constructional or mechanical qualities of the vehicle, to which latter the prizes had no relation. Prizes were awarded as follows:—

Class I. Steam Vehicles: 1st, James Muir, driver of Mr. Robert Dawson's wagon (Fodens, Ltd.), with carrying capacity of 100 cwt.; 2nd, D. Gibson, driver of Scottish Co-operative Wholesale Society's Ltd.'s lorry (Alley and McLellan, Ltd.), with carrying capacity of 120 cwt.; 3rd, Peter Ferguson, driver of United Co-operative Baking Society, Ltd.'s bread van (R. Morton and Sons, Ltd.), with carrying capacity of 50 cwt.

For some years it has been the practice of the Auto C.C. to limit open motor-cycle races to those machines fitted with engines having a cylinder capacity not exceeding 76 by 76, or the equivalent volume swept out. The result has been that the manufacturers of these small engines have continued to improve them to such an extent, in order to get the best results out of them, that they are capable of attaining a speed of nearly 55 miles an hour, and this speed is unsafe on the existing tracks. It seems a pity to further limit the size of engines to, say, 70 by 70, for this size is but very little used: the only other alternative, therefore, would appear to be to limit the ratio of gearing.

ON Saturday, the last of the Auto Cycle Club's quarterly trials for the season was held, when sixteen machines participated in the run from Uxbridge. The run out to Dashwood was almost without incident. The following are the performances of each machine up the hill, "zero" being the fastest performance of the day, accomplished on a 9-h.p. twin-cylinder Bat, the fastest single-cylinder performance being that of F. W. Applebee, who was only 2-2-5 sec. behind that of the twin:—

Name.	H.P.	Machine.	M. sec.
D. G. Gilmour ...	9	Bat ...	zero.
F. W. Applebee ...	3½	Rex ...	2 2-5
F. C. Dee ...	5	Vindec Special ...	9
L. W. Bellenger ...	3½	Quadrant ...	10 2-5
H. G. Partridge ...	6	N.S.U. ...	33 4-5
G. L. Evans ...	2½	Rex ...	49
H. S. Catling ...	2½	Anglian ...	57 2-5

Some of the Albion Cars in the Glasgow Demonstration of Industrial Motor Vehicles.

Class II. Petrol vehicles with carrying capacity exceeding 26 cwt.: 1st, Jas. Kennedy, driver of Mr. Alex. Kennedy's 12-h.p. delivery van (Arrol-Johnston Car Company, Ltd.), carrying capacity 30 cwt.; 2nd, H. Stewart, driver of Mr. R. D. Waddell's lorry (Milnes-Daimler, Ltd.), carrying capacity of 50 cwt.; 3rd, V. King, driver of Bow's Emporium's delivery lorry (Albion Motor Car Company, Ltd.), carrying capacity 40 cwt.

Class III. Petrol vehicles with carrying capacity not exceeding 26 cwt.: 1st, W. Stronach, driver of Pettigrew and Stephens, Ltd.'s 16-h.p. parcel van (Albion Motor Car Company, Ltd.), carrying capacity 24 cwt.; 2nd, H. Macnab, driver of "Glasgow Evening News" delivery van (Argyll Motors, Ltd.), carrying capacity 15 cwt.; 3rd, J. Steel, driver of Cooper and Company's delivery van (New Arrol-Johnston Car Company, Ltd.), carrying capacity 20 cwt.

Mr. Adam explained that this was the first effort which had been made in Scotland to show the commercial community and the public generally the recent development which had been made in the manufacture and adoption of self-propelled vehicles for commercial purposes, and he thought they were to be congratulated upon the extensive and varied nature of the display.

Seven of the vehicles were shod with iron tyres, twenty-three with Royal Sirdar buffer solid tyres, and the remaining twenty-three with various other makes of solid tyres.

AUTO-CYCLE CLUB.

IN an official *communiqué* of the Auto C.C. we learn:—The time has now arrived when it has become necessary to enquire whether it is not advisable to further limit the size of engines on the racing track.

W. Smith ...	1½	Motosacoche ...	1 2 4-5
E. W. Haswell ...	6	N.S.U. Sidecar ...	1 3 3-5
G. T. Fletcher ...	1½	Motosacoche ...	1 9
W. O. Bentley ...	3½	Bell ...	1 43 4-5
A. G. Peppercorn ...	2½	Anglian ...	1 44 3-5
M. W. Randle ...	10	Lagonda ...	1 53 4-5
Capt. H. A. Webber ...	5½	Rex de Luxe ...	1 54 2-5
C. Gordon Bell ...	1½	N.S.U. ...	1 57 4-5
W. Montgomery ...	3½	Montgomery Sidecar ...	retired

The following succeeded in making non-stop runs:—G. L. Fletcher, 1½-h.p. Motosacoche; L. W. Bellenger, 3½-h.p. Quadrant; H. S. Catling, 2½-h.p. Anglian; F. W. Applebee, 3½-h.p. Rex; A. G. Peppercorn, 2½-h.p. Anglian; M. W. Randle, 10-h.p. Lagonda. The performances in the Consumption Trial were as follows:—

G. L. Fletcher ...	1½-h.p. Motosacoche	156 oz. = 127.7 miles per gal.
Capt. H. A. Webber ...	5½-h.p. Rex de Luxe	390 oz. = 51 " " "
R.A.		
M. W. Randle ...	10-h.p. Lagonda	630 oz. = 31.6 " " "

LEICESTERSHIRE.

A PLEASING little ceremony was performed at the headquarters of the Leicestershire Automobile Club, where a deputation from the Guild of the Crippled was invited to receive the proceeds of the gymkhana held on the occasion of the visit of the Motor Union of Great Britain and Ireland to Leicester. Mr. E. G. Mawbey, president of the Leicestershire Automobile Club, was in the chair, and expressed the pleasure the club had in presenting a cheque of £71 14s. towards the fund for building the new hall for the Guild of the Crippled.

SOUTHEND AND DISTRICT MOTOR CLUB.

THE closing run of the Southend and District Motor Club took place to Witham. Luncheon was partaken of at the White Hart, Witham, between twenty and thirty being present. Among those who started from Southend were Messrs. Carruthers, Dr. Laing, Mr. Vivian-Millet, Dr. Hopkins, Potter, Brittain, Greenfield, Goodman, Palmer, White, Smith, Crump, Parsons, Hertridge, and Foster Spencer, with the hon. sec., Mr. A. Warnery.

ON Saturday the 19th inst., the Junior Automobile Club held a week-end run to Leamington, returning to town on the following day. Despite bad weather over twenty members mustered at the Crown Hotel. This was the last run of the present season for the Junior A.C.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

SPARE MOTOR WHEEL OF AMERICA.—£85,000. (£1). To acquire the U.S.A. patents of the Spare Motor Wheel, the St. Anne Kerosene Motor Cars, and the U.S.A. Standard Speedometer, and the undertaking and all or any of the assets of the St. Anne Kerosene Motor Company, of St. Anne, Illinois. The Stepney Spare Wheel, Ltd., of Llanelly, has consented to this registration. 2, Clarence Parade, Cheltenham.

S.P.A. MOTOR COMPANY.—£1,000. To acquire all or part of the benefit of a contract dated January 12th. 1907, between the Societa Piemontese Automobile Ansaldo Ceirano (S.P.A.), of Turin, of the one part and the Spa Motor Company, of London, of the other part, and all or any of the assets and liabilities of the business of the Spa Motor Company, and to adopt an agreement with Messrs. H. E. Hall and H. O. Hall. No initial public issue. First directors: Messrs. H. E. Hall and H. O. Hall (managing director). 15, Riding House Street, W.

The above illustration depicts the novel manner in which the Acton Vale Repair Works of Messrs. Panhard and Levassor utilise the step for securing the spare tyre.

THE COMMERCIAL VEHICLE TRIAL.

OFFICIAL revisions in the list of time lost registered against the vehicles which completed the five weeks' running in connection with the Royal A.C.'s Commercial Vehicle Trials are as follows:—Broom and Wade paraffin wagon (Class E), mechanical trouble 237 min., depot trouble 541 min. Thames delivery van (A5) depot trouble, 841 min. Milnes-Daimler tip wagon (E28), depot trouble, 336 min. Ryknield covered van (E47), no depot trouble, and no time lost.

The list, however, is still provisional, being subject to further alteration.

ARMY MOTOR RESERVE.

DURING the recent military manoeuvres the Army Motor Reserve was continuously employed, sixty-three officers of the corps being attached to the various forces. These officers performed an aggregate of 531 days' military duty, and travelled a distance of 26,000 miles.

Lieutenant G. H. V. Milbank, with his car, was placed on duty with the German Attaches who had been appointed by the German Emperor to attend the Army Corps manoeuvres.

METALLURGIQUE CARS, LTD., ask us to mention that in future all business will be transacted at 36, Lorne Gardens, Regent's Park, N.W., to which address all communications should be sent.

OWING to the promising debut of their new all-British Badminton car, Messrs. Teste and Lassen are taking larger premises, their choice having fallen upon the works in Scrubb's Lane, Willesden, until recently occupied by the Fiat Company. Amongst the first sales of the new car have been two for China, one being for Mr. C. Craig, of Shanghai, and one for a Chinese Mandarin whose name is omitted by request.

THE L.G.B. AND THE SAFETY OF THE ROAD.

A CIRCULAR letter has been sent by the L.G.B. to County Councils other than the London County Council, under date October 16th, 1907, as follows:—

I am directed by the Local Government Board to state that it appears from the replies they received to their letter of June 10th last as to the number of signboards denoting dangerous corners, cross-roads and precipitous places, set up by County Councils in England and Wales under Section 10 (2) of the Motor Car Act, 1903, that a considerable diversity of opinion exists amongst County Councils as to the action which should be taken by them under this enactment. The replies show that some county councils have put up a large number of signposts while others have put up none at all or very few.

It seems to the Board that County Councils may properly be asked to consider the expediency of a more extensive and systematic use of the facilities afforded by the enactment in question, and by other provisions of the law, for the prevention of accidents, not only to motor-cars but also to other vehicles and persons on roads in relation to which County Councils have powers and duties.

Under the particular enactment to which attention has been drawn, the County Council are the authority responsible for the erection, throughout every part of the county which does not comprise a borough with a population exceeding 10,000 at the last census, of the signposts intended to denote dangerous corners, cross roads and precipitous places on or near main roads or other highways. It is obvious that the exact spot to be chosen for the erection of a signpost for any such purpose is that at which this indication of danger ahead may most advantageously be exhibited for the guidance of a person not familiar with the road. Whether the spot be in the neighbourhood of a cross road which is not visible until actually reached, or of a steep hill with a turn in its course, it will, no doubt, occur to County Councils that, in fixing the position of the signpost, they may profitably avail themselves of the experience of persons accustomed to drive mechanically propelled vehicles or concerned with other traffic in the locality.

While it may be expected that a more extensive use of signposts will tend to material diminution of the risks attendant upon the traffic on many roads, the Board think that it may be for County Councils to consider whether, in certain circumstances, they may not usefully take other steps for attaining this object. It will be borne in mind that a County Council, with respect to a main road, have powers of improvement and enlargement. Further, as regards other highways, they are authorised to contribute towards outlay for these purposes.

Apart from those cases in which obstruction in carriage-way or cartway is caused by hedges or trees, and from other cases of danger through encroachment or otherwise, the Board may mention, as an example of powers which might be exercised for the general benefit, the improvement to be effected by the cutting off of corners in a road. In such a position, high hedges and banks are often a source of danger, and the needful alteration or removal of the hedge or bank, whether as part of the improvement carried out by a County Council, or as part of the improvement to which they contribute, may well be regarded as an important feature of the improvement. It may frequently be possible for the County Council, by agreement with the owners of the property adjoining the road, to arrange for the removal or diminution of the obstruction to view. There are probably many cases in which the owner would be willing to co-operate with the local authority in the matter, and the Board hope that in such cases the County Council may think it desirable to proceed in this manner. The Board have no doubt that the matters to which this letter refers have been considered by many County Councils, but in view of the too common occurrence of accidents they have thought it well to draw special attention to them.—I am, sir, your obedient servant,

S. B. PROVIS, Secretary.

IN view of the recent enthusiasm raised by the performance of various airships, it is interesting to note that the Zeppelin airship, (the largest in the world) has just concluded a trial which lasted nearly eight hours, a speed of over thirty miles per hour being attained. The envelope of the Zeppelin is not constructed of goldbeater skin, as in the case of the British vessel "Nulli Secundus," but of a much stronger material made by the Continental Tyre Company specially for the purpose.

THE new catalogue of the Peter Union Tyre Company illustrates both the company's beaded edge and Simplex tyre. The former can be fitted to any rim; the latter has to be fitted on a special rim. The edges of the tyre are fitted with a wire rope which keeps it firmly on the rim and requires only one security bolt. Particulars are also included of the Peter Puncture Proof Band, and copies of the excellent list can be obtained on application to 6, Upper St. Martin's Lane, London, W.C.

THE Secretary of the Royal Commission on Congestion in Ireland has written to Messrs. Brown Bros., Ltd., respecting the four 20-22-h.p. Brown cars which have been employed by them on their recently completed journey, stating that the vehicles engaged by the Commission, which were each employed for about 100 days between April and October, ran extremely well. "They had a very severe test, being out in all weathers, mainly on bad roads in the West of Ireland, and, owing to the uncertainty of our movements, there was but little time for overhauling, yet we had no breakdown and practically no trouble except the ordinary tyre troubles."

CASES UNDER THE MOTOR CAR ACT.

AN APPEAL ALLOWED.

At the Surrey Quarter Sessions at Kingston, Sir Henry Norman, M.P., on the 18th inst., appealed against a conviction and a fine of £3 by the justices of the Guildford division for driving a motor-car at a speed dangerous to the public at Witley, on July 7th. The police alleged that the car was travelling at a rate of thirty miles an hour, but Sir Henry denied that the speed exceeded twenty or twenty-one miles an hour, there being no traffic on the road. Sir Henry added that he felt that if he were to be classed among the inconsiderate drivers of motor-cars and road hogs his efforts and influence in the putting down of inconsiderate driving on the part of others, a work in which he was deeply interested, would be largely discounted. Lady Norman and the chauffeur having also given evidence, the court allowed the appeal, but refused to allow costs.

SUMMONS AGAINST A DOCTOR DISMISSED.

The chauffeur of a West End physician was summoned by the police at the South Western Court on Saturday for driving a motor-car at an excessive rate of speed at Park Side, Wimbledon Common. The doctor attended the court and said he received an urgent message to visit a patient who was very ill, and he gave his servant instructions to travel quickly. Mr. De Grey (the magistrate) said that if he were taken ill he would be glad if the doctor arrived promptly. He dismissed the case.

HEAVY HAULS.

At St. Augustine's (Canterbury) Petty Sessions, five motorists have been fined various amounts aggregating £14 15s. for furious driving.

THE IDENTIFICATION OF THE DRIVER.

Francis J. R. Canese was summoned on Monday, at Bromley (Kent) Police-court, for exceeding the speed limit on the Maidstone road at St. Paul's Cray. The police evidence was to the effect that a car was driven at a speed exceeding twenty-six miles an hour, but the number only was taken, and the car was not stopped. None of the police witnesses could identify the defendant as the driver. The solicitor who defended contended that there was no case to answer. All the evidence went to show that a certain car exceeded the speed limit, and there was no more evidence against the defendant than against the Bench itself. The car ought to have been stopped. However, the police must bring evidence to identify the defendant as the driver of the car. The police contended that the owner of the car must supply the information, but it was pointed out that the only condition as to this was in the first section of the Act, and this case did not come under that. The Bench dismissed the summons.

A DISMISSAL.

J. W. Brierley, of Middleton, was summoned at Altrincham on Monday for driving a motor-car at a speed exceeding twenty miles an hour through Timperley and Baguley. The police evidence was that defendant's car covered three miles in 6½ minutes. The defendant declared that there must have been an error, as it was impossible for a 6-h.p. single-cylinder car, carrying six passengers, to travel at that speed. If the police could get the car to do it he would make them a present of it. The chairman (Mr. J. W. Sidebottom) said the Bench were inclined to think there had been a mistake, and they would give defendant the benefit of the doubt. The case was dismissed.

NO LICENCE WHEN LEARNING.

Before the Maidenhead County Bench, Diana Bulteel, of Brook Lodge, Cheapside, Ascot, was charged with having driven a motor-car

Photo by)

The Commercial Vehicle Trials.—The Competing Machines Dismantled for the Examination by the Judges.

[Argent Archer.

On a recent day at Dumbarton eleven motorists were fined various sums from £1 to seven guineas for travelling too quickly in Helensburgh. Six motorists have been fined £15 7s. 6d. at Coventry after being caught in a trap at Allesley.

FURIOUS DRIVING.

W. H. Welch, of Redcliff Back, Bristol, has been summoned for furious driving. After hearing both sides the magistrates regretted that the police had not been able to stop the car and give the defendant an opportunity to call more witnesses. Still, there had been nothing against him before in his many years as a motorist, so they would dismiss the case.

At the Kingston Borough Bench, Harold Lawford, of Kinellan, Wimbledon Common, was summoned for exceeding the ten-mile speed limit in Clarence Street. The case was first before the court the previous week, but was adjourned to allow the defendant to produce his motor driver's licence. On that occasion he told the magistrates that at the time he was hastening to fetch Mrs. Herman, whose son the previous day had met with a fatal motor accident at the Brooklands Motor Track. On Wednesday the Mayor said, under the circumstances, the magistrates decided to dismiss the summons on payment of costs.

A case, arising out of an accident at Chiddingfold, has been before the magistrates at the Hailsham Petty Sessions. Sophia Gertrude Goad, of Castle Keep, Reigate, was summoned for driving a motor-car at Chiddingfold on August 14th at a speed dangerous to the public. After hearing the evidence of the defendant, the magistrates were evenly divided in opinion, and the case was dismissed.

at Winkfield, on August 8th, without having a licence. The defendant, who stated that she was having a lesson in driving at the time, was fined 10s., with 7s. 6d. costs.

UNREGISTERED VEHICLE.

Richard Carne has been summoned for driving an unregistered motor vehicle at Shooter's Hill, Woolwich, and Tarspra, Ltd., has been summoned for aiding and abetting in the commission of the offence. The firm were further summoned for failing to cause all the paint of the lettering and figures to be renewed on the registered axle. Carne was fined 20s. and 2s. costs, and the Tarspra Company to pay the costs.

THE BRITISH PETROLEUM COMPANY, LIMITED, send us examples of the series of Shell motor spirit pictorial post cards they intend distributing at the forthcoming exhibition.

MESSRS. HENRY ANGUS, SANDERSON AND COMPANY, of Westgate Road, Newcastle-on-Tyne, have sent us a photo of forty of the Daimlers they have sold this year. Altogether they have disposed of just on 100 new cars as well as several second-hand ones, and report that the prospect for the coming season seems to be even more promising than the last.

MR. F. E. COPPEN, of the London and Parisian Motor Company, Ltd., is, we learn, taking the new 16-h.p. Hotchkiss, which is being put on the market for the 1908 season, into all towns of any importance in England before the Olympia Show, with a view to demonstrating same to agents and fixing up agencies for the coming season. Should any agents wish to see the car they should communicate with the London and Parisian Company.

FORTHCOMING EVENTS.

OCTOBER.

- 26th (S.).—Scottish A.C.'s hill climb near Fintry, Stirlingshire.
Motor-cycling conference at Nottingham.
Birmingham M.C. run to Roydon.
Auction sale of motor-cars by Messrs. Hampton and Sons, Ltd., on the Brooklands Track.
- 30th (W.).—Annual meeting of the Marine Motor Association.

NOVEMBER.

- 8th (F.).—Society of Motor Manufacturers and Traders' Dinner, Grand Hotel, Charing Cross.
- 11th-23rd.—Olympia Motor-Car Exhibition.
- 12th-30th.—Paris Motor Show.
- 13th (W.).—Annual Dinner of the Motor Union at the Hotel Great Central, London.
- 20th (W.).—Institute of Automobile Engineers. Address by Col. R. E. Crompton.
- 22nd-30th.—Stanley Show.
- 30th (S.).—Annual dinner of the North London A.C. at the Midland Grand Hotel, London.

DECEMBER.

- 2nd (M.).—Cheshire A.C. annual dinner.
- 4th (W.).—Southend and District M.C. annual dinner.
- 5th (Th.).—Exhibition at Berlin.
- 7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.
- 18th (M.).—General Committee of the Motor Union.
- 21st (S.).—Opening of the Brussels Exhibition.

MARCH, 1908.

- 21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

AUTOMOBILE ACCIDENTS.

WHILE Lord Dunleath and some friends were motoring to Glasgow on their way south from Glenclunie Lodge their Daimler car backed into the public weigh-house at Blairgowrie. The building was struck with such force that it was shifted back a foot, and was only saved from overturning by a telephone post immediately in the rear.

A MOTOR mishap has occurred at Meadowbank, Applegarth, N.B. A chauffeur was driving a car containing two ladies and two gentlemen on their way from Glasgow to London. When passing beneath the railway bridge he noticed a postman's gig, which attempted to pass, but, when almost in line, a small boy, who had been hanging on to the gig, stepped in front of the car. The driver had no time to draw up, and to save running over the child he swung his car to the left, with the result that it struck the back of the trap with considerable force. The gig was overturned, but fortunately its occupant was unhurt. The car struck the banking and toppled over on its side, the occupants being thrown out. All, with the exception of the chauffeur, escaped without injury, but Braidstreet was badly shaken. The car itself was damaged, and was afterwards towed to Lockerbie for repairs, after which it was able to continue its journey. The chauffeur had to return to London the following day by train.

POLICE TRAPS.

THERE is a trap between Beaingby and Bridlington.

ALONG the Upper Worthing Road, in the parish of Poling, the police have a measured quartered of a mile.

POLICE traps have been established at Allealey—one on the Meriden side of the village and another close to the Coventry boundary.

NEAR Weeton Station, on the Otley road, is a police trap leading to the Knaresborough court.

MOTOR traps have been established at Horsley and Corbridge, near Hexham.

THE Christchurch traps are again in active operation.

AT Ruxley Hill, North Cray, the measured distance is again in charge of vigilant officers.

THERE is a trap in the parish of Angmering (Sussex).

MOTOR-CAR drivers in London have decided to recognise as a call for their services three blows of a whistle.

WE learn that the Elastes Company are now prepared to fill motor-cycle tyres with their well-known Elastes material.

MOVIL is the name given by Messrs. Carless, Capel and Leonard to the quality of motor spirit which is ordinarily used of 71.5/72.0 specific gravity. The firm, of course, still supply their Standard petrol of 70.0 specific gravity.

BUSINESS NEWS.

THE Stepney Spare Wheel is being introduced into India by the Bombay Motor Car Company, Ltd.

THE ALBANY AUTOMOBILE COMPANY, of 106, Albany Street, London, N.W., is making a speciality of hiring cars, and have already a large clientele.

THE SIRDAR RUBBER COMPANY, LTD., send us a photo which depicts in a striking manner the growing popularity of the Sirdar pneumatic tyres with grooved covers.

ON Monday the Stepney Spare Wheel, Ltd., received a telegram to dispatch at once an 880 and 895 adjustable Stepney wheel for the King of Spain's car.

MESSRS. W. GALLOWAY AND CO., of Gateshead, have just been appointed sole agents for Stanley steam cars in London and fifty miles round.

THE new chain making works of Messrs. Hans Renold, Ltd., at Burnage, near Manchester, are now rapidly approaching completion, manufacturing operations in one of the departments having been commenced last week.

MR. C. H. BAILEY, of Barry Dock, who has recently acquired his seventh Daimler car, has written to the Daimler Company stating that the 35-h.p. car, of which he recently took delivery, has in every way come up to his expectations. "I began seven years ago with a 6-h.p., which was followed by a 9-h.p., and a little later on by a 16-h.p. This car in turn was succeeded by three 23-h.p.'s, and now the 35-h.p. makes seven, and every one is in use; even the 6-h.p. is still doing good work."

LADY WAKEMAN has, through Messrs. Rippon Bros., of Huddersfield, had a good many "Arco" non-skid bands, and at this moment Messrs. Rippon have both a plain and a non-skid cover for repair. One of these non-skids of the Acre Rubber Company on her ladyship's 14-20-h.p. Renault has run 8,200 miles. After 2,438 miles it was sent to be "Arco'd." It then ran 3,177 miles to August, 1906, when it was again sent to be "Arco'd." From September 1906 to April, 1907, it ran 2,464 miles, when it was "Arco'd" for the third time.

THE Hon. Dudley James writes that his 30-h.p. Beeston-Humber has run over 7,000 miles, and has not been delayed on the road more than an hour in all. "We frequently do the run from London to Bexhill without change of gear, and the car has climbed Llanberis Pass easily on top speed with four up and a quantity of luggage."

THE "London Gazette" of October 15th last contained an announcement of the voluntary winding up of a company named the Stanley Show, Ltd. This does not mean that any alteration is being made in the lines upon which the Stanley Show is being held at the Agricultural Hall. The explanation of the announcement is that certain changes are being made in the constitution of the company which owns the name, and these changes necessitate the formal winding up of the old company and the registration of a new company in the same name.

FOR low petrol consumption the Berliet car, the agents for which are Messrs. J. E. Hutton and Company, Ltd., is hard to beat, and this in a large measure is due to the hand-controlled auxiliary air inlet fitted to all Berliet models, which permits the richness of the mixture to be varied at will. The following figures were arrived at when experimenting with a standard 60-h.p. four-cylinder Berliet, the speeds during the tests averaging sixty miles an hour:—Petrol, auxiliary air valve quarter open, 11.35 miles per gallon; Anglo, 76 gravity, auxiliary air valve half open, 11.88; Borneo, 76 gravity, auxiliary air valve half open, 12.63; a spirit of 755 gravity, auxiliary air valve half open, 13.1.

FROM Iris Cars, Ltd., comes a copy of the new catalogue of Iris cars. The detailed specification of the various models—25-h.p. and 35-h.p. four-cylinder and 40-h.p. six-cylinder—with the variations in each particular feature, are clearly indicated in such a way that, without turning over a number of pages, one can see at a glance the difference between any special point of the four and six cylinder models. Another feature is the showing of all the principal details of the cars in tabulated form, so that one can instantly see the dimensions or style of any particular detail. The list, which is well illustrated, concludes with a number of testimonials from various parts of the world showing the "Iris" is equally satisfactory under all conditions of climate, &c.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-28, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are desired to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, NOVEMBER 2, 1907.

[No. 452.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C. It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

IN our issue of August 24th we gave the awards of the judges in the competition organised by the Roads Improvement Association in May last. These have now been supplemented by some observations in a report of considerable interest, in which the performances of each appliance is referred to. A summary of this is given on another page. Here we would mention that it is generally accepted that an application of two coats of tar is necessary for preserving the road surface, and the judges would have wished to carry out the trials under that condition, but the weather and other circumstances did not permit. Therefore it could not be expected that the surfaces treated with one coat only would be durable, and the trials in respect of durability do not reflect on the machines competing. The final judgments and awards in the Machine Competition have been based upon the machines only. In spite of the generally unfavourable nature of the weather during the Trials, the results on the whole may be considered satisfactory, and much useful information has been obtained in connection with the comparative merits of the various materials used, and of the methods of spreading these materials. Enough has already been done to show that machinery can be successfully applied for this purpose, and that its use is both rapid and economical as compared with the cost of applying the same quantity by hand.

Judges' Observations on the Dust Trials.

SPEAKING generally the whole of the machines tested showed originality and forethought in design, and considering the short time the demand for this machinery has been before inventors the results obtained are exceedingly promising. No doubt most of the machines exhibited can be improved, and when using the proper material in correct quantities they are all likely to give satisfactory results. Suitable tar compositions are practically insoluble, yield no matter liable to be washed away into the water courses to pollute and to cause damage, nor should there be any considerable quantity of tar-dust ground off the road surfaces after treatment. The judges believe that the complaints made under this head previous to these trials have been due to the use of improper materials, that is to say, tar from which the more unsuitable compounds have not been extracted previous to the tar being used on the road. Now that this is understood it is probable that most of these difficulties will disappear. Little has been said in this report as to the Ascot experiments. The judges consider that this portion of the work was not satisfactory, for several well-

understood reasons. In the first place, the tar supplied from the Reading Gas Works was apparently unsuitable for spraying by machinery. Through some unexplained cause a great deal of foreign matter found its way into the tar, which blocked the nozzles of the machines and caused very irregular working. Heavy rain had fallen on the night previous to the experiments, and in consequence in many parts the tar, instead of penetrating, was lifted off by the traffic in the form of a detached film.

The Councils and the Roads.

A DEPUTATION of representatives of the leading County Councils will shortly be appearing before the Local Government Board to call attention to the damage alleged to be done to the main roads by motor traffic, especially in the vicinity of the metropolis. The county authorities of Kent, Hertfordshire, and other home districts, are already moving in the matter, and the chairman of the Highways Committee of Hertfordshire has just indicated that they are associating with a view to secure a graduated scale of licences proportionate to the nominal horse-power of the motor vehicle. The total amount received as a result should, in their view, be paid to a central account and distributed in an equitable manner among the various road authorities. Lord Salisbury, at Monday's meeting of the Hertfordshire County Council, also expressed his opinion that the owners of cars should pay for the damage they were said to cause. These and other things point to the fact that a combined movement is being promoted, and we trust that the organisations that have particularly identified themselves with automobile policy will be watchful as to the arguments and proposals placed before the Local Government Board by the deputation. In many ways the proposed gathering is one of the most important steps that has been taken against motorists within the last few months; hence the warning that we feel compelled to give to all at the present juncture.

A Parliamentary Motion.

SINCE writing the foregoing, further evidence of the interest taken in the future legislation with regard to automobile matters comes from Sussex. Writing to the Uckfield Rural District Council acknowledging the receipt of a resolution expressing the opinion that the money received by the Inland Revenue Commissioners for motor-car licences should be more evenly distributed over the country, Earl Winterton, M.P., said he thoroughly agreed with it, and he proposed to move in the matter, so far as he was able, during the next session of Parliament. Having regard to the fact that Sussex was more frequented by motor-cars than almost any other

county in the kingdom, he would suggest that some collective action by all the road authorities in Sussex should be attempted with a view to strengthening the hands of the Parliamentary representatives of the county, who, he believed, irrespective of politics, would almost unanimously favour an alteration in the existing law. He was in no respect hostile to motor-cars, but he was anxious to see a more equitable distribution of the money arising from licences. The Hon. Hubert Beaumont, M.P., has also written in similar strain, and it seems fairly certain that the Motorists' Parliamentary Party will have to meet to consider the situation at a very early date in the next session of Parliament.

New Guide Posts.

DURING the past summer Mr. Henry Moore, of Brighton, has been indulging in a series of motor trips in Sussex lanes, with a view to suggesting new routes for the motorists of that charming county, so that they may be encouraged to a better acquaintance with their locality. In the course of his wanderings he found many confusing corners and several spots where it was easily possible for strangers to lose their way. Some of these have been duly reported to the Automobile Association, which is now putting up such signs as that illustrated herewith. The sign is fixed at a point where the main

Mr. Henry Moore, of Brighton, on his 15-h.p. Humber.

Brighton road divides into two, one *via* Hickstead and the other *via* Cuckfield. It is intended to convey to every motorist that the road *via* the former place is peculiarly advisable, because the A.A. patrols are in force there, and not on the Cuckfield stretch. The significance of the information will be obvious. In the picture Mr. Moore is seen at the wheel of his 15-h.p. Humber car.

The Attitude towards Motorists.

THE views of gentlemen interested in matters of local government are so often misunderstood, and even misrepresented, that opportunities of removing misgivings as to their attitude are always welcomed. We are glad, therefore, to have the contradiction by Mr. C. H. Harrold, of Merstham, in the letter published on another page, of the report recently attributed to him. And having accepted his assurance, we would add our expression of regret that such inaccuracy should have appeared. With his opinion as to the dust nuisance and its attendant depreciation of property on main roads motorists are greatly in accord, and the experiments that have been conducted by the Royal A.C. and other motoring organisations testify to a desire to lessen the evil. On the other point, our own columns have frequently proved the desire of owners of cars to secure universal consideration for other users of the road as well as those who dwell near the highways.

Fuels.

THE full report of the Fuels Committee of the Motor Union, including in its eighty pages several valuable appendices, has just been published. The Fuels Committee, which sat for nearly twelve months under the chairmanship of Dr. H. S. Hele-Shaw, F.R.S., was appointed in September, 1906, "to inquire into the recent alarming rise in the price of petrol, and to report what steps, if any, can be taken to protect the interests of the private consumer." The committee made a very thorough investigation, and their report constitutes the most important and exhaustive publication that has yet been issued on the subject of fuels for motor-cars. The report deals with the present supply of petrol and its prospective shortage and the control of the petrol supply. The possible substitutes for petrol which have been considered by the committee are heavier spirit, paraffin, naphtha, benzol, and alcohol. A comparison of the respective merits of petrol and alcohol is given in the report. The appendices include a brief description of the fuels mentioned in the report, the evidence of the witnesses examined, and memoranda on petroleum, petroleum spirit, paraffin, shale spirit, benzol, alcohol, &c., and a bibliography.

Northern Fairness.

THE chairman of the Stratton (Devon) Bench having advised the local police to use stop watches instead of ordinary timekeepers when setting traps in the future, we would suggest that the authorities should be careful with regard to the class of instruments purchased. St. Helens in the north and Stratton in the west have a point in common, inasmuch as both their Benches are familiar with speedy motorists whose progress has been delayed by the police. At St. Helens the other day there was a batch of prosecutions against drivers of motor-cars, and in the course of the proceedings the magistrates asked the sergeant and a constable to show the Bench how they started and stopped their watches. This having been done, the Chairman remarked that there was a trifle of difference between the two. After the trial, counsel for the motorist pointed out that the watches had been set off under ideal conditions, and the Chairman observed that there was great difficulty in starting them. "I could not start one," he said, "unless I did it with a coin." In the next case a motorist was summoned for driving in a dangerous manner. One of the constables, in giving evidence, said the sergeant was in a field, and when he saw him turn his head round that was the signal he got that a motor-car was coming. The Chairman cut off this evidence abruptly by saying, "There is no use going on. This is an absurd case. The evidence as to the speed is not at all satisfactory."

The Motorist of Moderate Means.

SOME figures given by Mr. L. G. Chiozza-Money, M.P., in connection with a general review of the future of the automobile industry are not without value to individual firms in the trade at the present juncture. It is being freely said that the limitations of the market for the high-powered cars that figured so largely in the inquiries of a few seasons ago have been nearly reached; the newer race of motorists are of more moderate possessions than many who figured in the ranks of the pioneer. And these are the people for whom makers and agents will have to cater. According to this M.P., who has specialised on statistics, there are in Great Britain 124,981 houses of a rental value of over £80 a year; less than 10,000 of these are of a value of more than £300 a year. When we remember the figures that have already been published as to the number of motor-cars in actual use, it will be recognised that many of their owners have become motorists. But there remain the great body of people living in houses rented at from £40 to £80 a year. These number 278,268, and constitute a class of people in which is a large proportion

of prospective motorists. And the character of the business that has lately been noted in London and the chief centres of the provinces proves that these people are giving heed to the allurements of the motor-car. Their demands will be the hope of the trade in the near future.

New Roads.

THE Ross Rural District Council have decided to send a memorial to similar bodies throughout the country urging that the money derived from the registration of cars and the licensing of drivers should be placed in one common fund and then distributed among the various counties, to be used by them for the maintenance of the public highways. In advocating the proposal, Colonel Middleton pointed out that the manner in which the fees were now collected was not just to the rural districts, as the majority of vehicles registered in large centres of population used the roads in the country more than they did the streets of populous towns. This is a point that has been urged frequently and influentially within recent years. Motorists generally will agree with the suggestion that the money should be placed in one common fund, but the re-distribution to the county authorities almost suggests a perpetuation of the present arrangements. A consensus of opinion has agreed that the matter is a national one, and only administration by a central body is likely to secure efficiency in the great national roads.

Public Oratory.

THE season of club and other dinners is now upon us and the floodgates of oratory have been let loose. Last week the Huddersfield branch of the Yorkshire Club and the South Devon Automobile Club held their annual gatherings at Huddersfield and Plymouth respectively, M.P.'s giving their benediction to motorists in both places. Mr. A. J. Sherwell and Mr. F. B. Mildmay, who sit on opposite sides of the House of Commons, were equally agreed in deprecating the imposition of a speed limit in the open country, and both deplored the methods of trapping devised and developed by the police in various parts of the country. Apparently, too, they were united in the belief that extra taxation will be imposed on motorists in the near future. And then the question will arise as to the reform of the present system, or rather want of method, prevailing in matters of road maintenance.

Road Manners in Guernsey.

MANY of the British motor clubs have rules of the road for the guidance of their members and the safety of the public, but none have gone so elaborately into the matter as the Guernsey Motor Association, which, although only of recent birth, has developed a great desire to be of service. It was formed largely owing to the exertions of Lieut.-Col. R. H. Carr-Ellison, and practically comprises within its ranks all the motorists in the island. The rules for motorists emphasise the necessity of holding up the hand when about to stop, and sounding the horn when within 100 yards of a corner. The Guernsey motorist is advised to never, for the sport of the thing, or without some very good reason, pass a higher-powered car, for, "if caught up by you and passed while it is going slow, you will yourself very shortly be overtaken and passed and subjected to a good dusting for the presumption." Should a car be met or overtaken in evident trouble always slow up and inquire if any help can be rendered, for welcome help can often be given by taking a message to the nearest telegraph or telephone office, or by offering a lift to some of the occupants of the car to or towards their destination. When two cars approach one another, both

The Motor-Car Auction at Brooklands.

should invariably slow down till they are well past, for the mutual benefit of their respective occupants. If possible, try to avoid splashing with mud, and covering with dust, other occupants of the king's highway, to which all have an equal right, the pedestrian most of all. It is safer to slow down and wait a reasonable opportunity to pass in close traffic than to dash in where angels would fear to drive; not only is the latter policy inconsiderate to all, but it is often criminally dangerous.

In India.

MANY leading British makers are taking advantage of the present lull in trade to push business abroad. At the end of the year many well-known types of cars will be taking part in the Reliability Trials in India. We are reminded of the development in the East by the result of the last Argyll competition, in which mention was made of a run by Mr. A. Turner Laing, of Bombay, on a 14-16-h.p. Argyll from Poona to Mahabaleshwar Hill Station, India. Several of the hills on this road are some seven or eight miles long, one, the Wai Ghaut, fifty-four miles from Poona, being seven miles long with a continuous gradient of about one in eight.

MOTORING AROUND BECCLES.

THE Norfolk Broads are the delight of boatmen and a veritable Elysium for those who love the water. The motorist need not dissociate his favourite pastime of road travel with the pleasant district on the borders of Norfolk and Suffolk, of which the ancient town of Beccles may, for the purpose of a brief holiday, be regarded as the centre. I have just had a most delightful week-end in that ancient gabled town

A View of Beccles and the River Waveney, from the Waveney Valley Railway.

[Illustrated Handbook of Beccles.]

—kept clear of the county of dumplings by the river Waveney, where Isaak Walton would have fished had the Lea not been nearer to hand, and where the fishing is free and plentiful. From London there are two alternative routes to Beccles. By way of Chelmsford, Colchester—where unfortunately police traps are freely placed, and as I drove through on my 15-h.p. Swift I saw the driver of a 6-h.p. Siddeley of the 1904 type in altercation with a policeman—Ipswich, and a fine run to Lowestoft. Then a few miles inland the church tower rises above the market-place of the little town, happily familiar with motor-cars through the enterprise of a company whose vehicles on hire are often to be met with on the roads thereabout. The other way is through Epping to Newmarket and Thetford, thence to Norwich and a southerly run to Beccles.

Motorists from the North and Midlands will probably make the city of Norwich their apparent objective, and then take this place on their way to Lowestoft or Yarmouth. In fact, I can suggest no more agreeable way of enjoying the sea breezes of the Norfolk and Suffolk coasts than to take daily spins from quiet, quaint Beccles, which lacks the noisy jollity of the holiday resorts, and has the distinction of calm evenings—which none would claim for Yarmouth in the season.

A mile away on the Norwich road is Gillingham, a very different sort of place to the Kentish Gillingham, near Chatham. It has a couple of churches, indicating a larger population in some distant year than is the case in this Twentieth Century. One has but the tower left; the other contains some heavy Norman work of interest to antiquarians and others. But there are scores of interesting villages, with old churches and lordly demesnes, within a radius of an hour's run. Blundeston, associated with David Copperfield, and Somerleyton Hall, built by Sir Morton Peto, should be seen, and also Bungay, to reach which from Beccles, Ditchingham House, the residence of Mr. Rider Haggard, must be passed. I was unfortunate when motoring that read in not seeing the distinguished novelist. In fact, I did not even discover whether he was a motorist—a very different experience to that which befel me when I motored to Rottingdean from Brighton some years ago. Mr. Rudyard Kipling was then living opposite the church, which faces the house

of Sir Edward Burne Jones, and daily motored to the coast, being such a public character that he has now fled for seclusion to Burwash. Sir Conan Doyle is bolder, and often motor-cycles from his home at Haslemere along the Portsmouth road. Now he is married I suppose he will do more of his travelling by car. But that is a digression; having seen the last-named novelists at the wheel of their vehicles I should like to have met Mr. Haggard on his car. Perhaps some one else may be more fortunate and favour the *M.C.J.* with a snapshot.

Bungay stands on a considerable elevation, and, from the remains of castle and church, would appear to have had a past; now it has little more than a railway station and an hotel.

And then, when I had seen and grown tired of the giddy round of amusement at Lowestoft, I went in search of the British Holland that tourists rave about—and so near. The road passes Easton Broad and Covehithe to Southwold, a restful little place eleven miles away, in the growth of which the G.E.R. motor service to Lowestoft promises to be a factor. Continuing the trip through Aldeburgh, it is a pleasant road to Walberswick, Blythburgh Common, and Dunwich—once an important ecclesiastical city; now there are none so poor to do him (*i.e.*, Dunwich) reverence. True, the remains are picturesque; that is all. But Walberswick and all the country around is delightful—a novel bit of landscape. "You can scarcely move a mile outside without recalling pleasant Dutch-like memories. The country might have been laid out and 'composed' by Dutch painters. Spacious green distances under bright silvery Van der Velde-like skies; cattle feeding that Paul Potter might have sketched; dykes and waterways and high wooden little bridges; red roofs shining in the sun, backed by trees and topped by grey church towers, and over all there is sunshine and the flavour of the sea." It was a sunny day that I saw Walberswick, and the silver sheen of the waterways gave a brightness to the greenery of the landscape. The roads were splendid—I fancy they are better in Suffolk than in Norfolk—and going inland awhile a rural ride was enjoyed back to Beccles,

The Church Tower, Beccles.

our trusty Swift car not being restrained by the machinations of the police. In fact, I came to the conclusion that in that part of the world the police are regarded as the protectors of property and the guardians of dissolute persons, and motorists do not come under their special notice. For which relief much thanks, and another trip to Beccles when opportunity offers. H. B.

The Argyll 40-h.p. Car.

WE have this week had an opportunity of inspecting the 40-h.p. car which the Argyll Company are introducing for the 1908 season, and which will make its debut at the forthcoming Show. The new vehicle, which differs in many particulars from previous Argyll practice, embodies several interesting departures, reference to which is made in the sub-joined description. The frame is made of channel section pressed nickel steel, well braced with substantial cross-bars. The front end has a neat taper to the spring horns, while the rear cross-bar is made with the lower flange shaped to receive the inverted transverse spring. The front springs are extra long and semi-elliptical, and the front ends of the rear side springs are fixed direct on to nickel steel pins bolted to brackets on the side members. The rear end is connected to the transverse spring by means of double shackles, and, as an instance of the care paid to the details, we may mention that all the shackle pins are supplied with grease cups.

The engine (Fig. 2) comprises four cylinders, 120 mm. bore by 140 mm. stroke, cast in pairs, with the interchangeable

which has many novel points; in addition to performing the ordinary functions of an automatic carburettor in a perfect manner, two extra features are introduced which render it more complete. The first is that it is possible to alter the proportion of air to petrol while the engine is running, and thus obtain the best mixture, according to the temperature and weather. The second feature is that it is possible to shut off all connection with the petrol jet, and allow nothing but pure air to be drawn into the engine. This, in addition to giving considerable braking power, serves to remove any deposit of carbonised oil from the pistons and plugs; and last, but not least, by destroying the vacuum produced when the throttle is closed, prevents oil from being sucked up into the cylinders. All the operations are performed by one lever. As will be seen from Fig. 3, the jet B is located at the base of a long and narrow vertical vaporising chamber F, to the upper part of which the throttle and automatic and hand controlled air inlets are attached. N is the automatic valve which is opened in accordance with the suction of the engine up to a certain position of throttle opening, the air

Fig. 1.—Plan of Chassis of Argyll 40-h.p. Car.

inlet and exhaust valves all on the one side. The valve lifters, which are adjustable, are operated by a cam-shaft running in extra large phosphor bronze bearings. The water space has been carefully designed for effective cooling; a large water jacket cover is fitted on the top of each pair of cylinders, and is held down by the half compression cocks, these being screwed on to the extension of the inner plug, which has a hole drilled through it to give connection to the combustion chamber. The crankshaft is a heavy nickel steel forging, and runs on three extra long bearings, which are supported in the upper portion of the base chamber, enabling the lower half to be removed to give access to the big ends without disturbing the bearings. The piston rings are not made with the usual angled joint, but with a joint which leaves no space for loss of compression, the joints overlapping one another. The motor is suspended from the main frame by the top half of the crank case, which is cast with four inverted U section arms, bolted to the side members. The water is circulated by a large gear driven centrifugal pump located on the left side of the motor. The water enters the cylinder jacket on the left hand side of the engine, just opposite the valves, and makes its exit through a flanged pipe fitted to the top of the water jacket cover. A current of air is drawn through the honeycomb radiator by means of a fan driven by a flat belt off a pulley on the extension of the crankshaft. The mixture is furnished by an entirely new carburettor (Fig. 3),

passing to the mixture through holes in the piston throttle X. As the throttle is further opened the air-holes K in the outer sleeve are brought into coincidence with those marked J in the piston, the engine then drawing the correct amount of air through these holes to give a perfect mixture. This is the position shown in the right of Fig. 3; that on the left indicates the location of the piston throttle when the supply of gas to the engine is entirely shut off. The motor then sucks pure air through the holes S and V. As the throttle is opened this air inlet is closed and the valve gradually opened to the petrol mixture. We are informed that the new carburettor has been given a lengthy trial and are being finally adopted, and that it gives very economical results. The ignition is by means of a gear-driven high-tension magneto, conveniently located at the right of the engine, coil and accumulators being also provided as a reserve. The synchronised contact maker is driven by skew gear off the magneto shaft, which is, as will be seen from Fig. 2, in a most accessible position.

An extension of the last-mentioned shaft is used to drive the geared oil pump for forced lubrication. The oil reservoir is cast on the underside of the bottom half of the engine crank case, and a large overflow cock is fitted to test the level of the oil. The latter is supplied thereto through a large filling plug, which also acts as an air release, formed in the engine arm, which has a cored channel to the base chamber. The oil is pumped

through the pipes, off which there is a bye-pass connected to a tell-tale on the dashboard, into the main bearings, and finds its way to the base chamber, whence it overflows through two pipes into the oil reservoir below. The level is thus kept constant, and so long as a drop of oil remains in the reservoir the lubrication is perfectly maintained; but, as a precaution against failure, the pump is placed on

the same level as the reservoir. The oil has to pass through a large gauze filter before passing to the pump, which prevents any grit getting into the bearings.

Passing to the transmission mechanism, the clutch is of the now familiar Argyl multiple disc design, fitted with an

extra number of plates. The disengaging gear has a neat and clean appearance, and to obtain a very large leverage, and at the same time avoid adding an extra operating shaft, a specially designed clutch pedal has been adopted. A joint

is provided on the shaft between the clutch and the gear-box to allow for any want of alignment between these parts, and also to enable either to be dismounted without disturbing the other. The change-speed gear (Fig. 4), which gives four forward speeds and a reverse, is of an entirely new design. The fourth speed is indirect; the direct drive is on the third, and is obtained by sliding the clutch on the main shaft into mesh with the clutches on the third speed wheel. All the other gears are on the sliding principle. The third speed clutch is carried on two large ball bearings, and the main shaft has two extra large ball bearings at the rear, while the front end is run in a phosphor bronze bush inside the third speed clutch. The sliding gears are all on the main shaft, which is made square in section to receive them, and the gear wheels on the countershaft are all solidly keyed on. The countershaft is also carried on substantial ball bearings at either end. The gear wheels are made extra broad and of specially selected material, the teeth being backed off to enable the sliding pinions to engage easily. The various speeds are controlled by a single lever working in a new design of gate quadrant. The latter has two parallel slots; the first, second, and reverse speeds are on the inner slot, and the third and top speeds on the outer one. A hinged catch is fitted, without lifting which it is impossible to get into the reverse. Spring levers with a slot to receive the operating handle have been adopted. When all the gears are in the neutral position the levers are positioned by their own spring.

in the gate, and at the same time positioning the operating handle. Fig. 5 illustrates the control arrangement, and shows that instead of, as usual, having the gate at right angles to the slot, it is made on the slope, so that in changing either from the second to third speed or from the third back to the second, it is not necessary to change the direction of the push or the pull on the operating handle, the slope of the gate making the change very easy to operate.

The power is transmitted from the gear-box to the rear axle by a cardan shaft having universal joints at both ends; suitable covers are provided to enclose the latter and a supply of grease for their efficient lubrication. The universal joints (Fig. 6) are of an entirely new type, the centres of the two crosspins passing through one another. This is arranged by having a large pin with a small pin passing through it; the sliding movement is taken up in the fork at the rear end. The live axle has also been re-designed; instead of having, as in the 14-16-h.p. model, four

castings for the outer casing, the new axle is composed of one single steel central casing with a large aluminium dust and inspection cover at the rear, and steel tube extensions to carry the hubs. There is more than one advantage to be gained from this; firstly, the central casing is very strong, not having to rely on bolts to keep the two halves together as in other types, whether they are split vertically or horizontally; there is also less chance of the grease leaking, as the cover joints have no strains tending to open them. The whole differential casing with the driving bevel pinion wheel bolted to it can be withdrawn for examination or repair without dismantling the axle from the car, or even removing the road wheels. In order to do this the hub caps are unscrewed, and the axle shafts withdrawn a few inches; the differential bearing ball race covers, which are held down by four studs, are then removed, when the driving gear can be lifted out at once for examination. The driving bevel pinion is made in one piece with the spindle, and runs on ball bearings, the larger of which are carried close up to the point where the greatest strain comes. The thrust is taken on a special ball race. A slight hole is provided on the main casing, so that the position of the teeth in mesh can be seen when adjusting the bevels. The hubs run on large ball bearings carried on the extension tubes which are fitted into the central casing. This leaves the axle with only the driving torque to withstand; no strains due to the weight of the car are allowed to come on it whatever, the power being conveyed to the road wheels by dog clutches in the hubs. In order to avoid local strains due to the necessary heating, no brazing operations are resorted to; the tubes are made a special fit for the sleeves of the main casing; the latter is then heated to a certain temperature and the tubes forced home; on cooling, the contraction of the casing on the sleeves makes a perfect joint, a substantial stud being afterwards screwed through both the casing and sleeve to make doubly sure. The spring bracket is allowed to float on the axle casing, a torque rod being fitted with double springs to eliminate shocks in starting and stopping. It will be noticed that the thrust due to the car swaying is not

transmitted to the differential thrust bearing, but is taken up directly in the specially designed ball bearing at the hub end.

The front axle is a steel stamping of strong design and of section, while the steering gear is of the usual worm and sector type. The control levers, which are mounted on the steering-wheel, are of a new type, the friction of a spring pad being relied upon for the positioning of both throttle and ignition. This is claimed to be a great improvement over the

ratchet type, which in many cases does not allow of an exactly correct position for the levers. The foot brake pedal is on the same shaft as the clutch pedal, and by a suitable arrangement of rods and levers is connected up to the brake shoes operating on a wide drum, keyed on the rear end of the main shaft of the gear-box; the brake shoes themselves are hinged on to pivots on the cross-bar. The operating lever is on the underside, and the shoes when not in action are prevented from rubbing

on the brake drum by links on an equalising lever kept in action by a spiral spring. In the chassis we examined the foot brake was of the contracting type, but we understand that this is being altered to the internal expanding pattern. The hand brake lever is pivoted on a boss underneath the centre of the change-speed lever, and is operated by a spring catch on the underside of the quadrant, which is cut with a ratchet to suit. The pull rod is attached to a lever which comes right in below the chassis and connected to the brake counter-shaft, the levers on which are attached to the operating levers on the hub brake brackets. The brakes themselves are on the cam principle, and adjustment is obtained from a fly-nut on the rear end of the side pull rods, which are covered with leather grease bags to prevent rusting. The new model is being made in two lengths of chassis—9 ft. 9 in. wheel base for ordinary side-entrance vehicles and 10 ft. 6 in. in the case of cars with covered bodies—the wheel track in each case being 4 ft. 9 in. From an examination of the chassis it is evident that very careful attention has been devoted to the design and construction of the new vehicle, which should give a very good account of itself during the coming season and fully maintain the Argyll Company's reputation.

A MOTOR lifeboat is now stationed at Newhaven.

THE imports of motor-cars and parts into South Africa during the eight months ending with August last amounted to £79,599, as compared with £71,970 in the corresponding period of 1906.

CONTINENTAL NOTES.

The 1908 Mercedes Cars.

For the 1908 season the German Daimler Company, of Unterturkheim, are turning out three sizes of four-cylinder cars, the bores and strokes being respectively 120 by 150 mm., 130 by 150 mm., and 140 by 150 mm. Two six-cylinder vehicles will also be made, the cylinder dimensions being 120 by 140 mm. and 120 by 150 mm. As regards the alterations in design, these will be largely confined to the motors, which will be equipped with oil pumps, inspection holes in the base chamber and plain bearings to the crank shafts. Low tension magneto ignition is being replaced by a new system in which a make and break is combined with the plug. No details have so far been made public with regard to this arrangement, but we gather that it is somewhat on the lines of the Simplex ignition, which attracted attention in this country two or three years ago. With the view of

for those with four cylinders, the winner being the one who most nearly approached his declared speed. There were fifteen competitors, the first place being taken by Bodart, on a Saven-them car, he being only 34 sec. out on his estimate of 35 kilometres. Van Gool, on a Darracq, was second, being 38 sec. more than his 30 kilometres.

Motor-car Accidents in Germany.

A conference was held at the German Ministry of Interior at Berlin, last week, to consider the steps to be taken, in view of the increasing number of motor-car accidents, to ensure the safety of the public.

The 1908 Targa Florio Race.

The rules for the 1908 Targa Florio race, which is to be held over a distance of from 400 to 450 kilometres in Sicily in

La Coupe des Voiturettes.—The Scene at the Starting Point of the Final Speed Trial.

increasing the easy riding qualities of the cars, long, straight springs are being adopted for the suspension of the chassis.

The Paris Salon.

Preparations are now well in hand for the annual Paris Salon, which opens its doors on the 12th inst. Already the industrial section is in an advanced condition. The building which has been erected extends over a great part of the Esplanade des Invalides, and will be as large for actual stand space as the Grand Palais, where the pleasure cars are shown.

A Belgian Motor-Car Competition.

A motor-car competition on somewhat novel lines was held on Sunday last by the Moto Club Anversois. The event was open to cars fitted with two-seated bodies and carrying 300 lbs. of ballast, and was over a distance of 115 kilometres. Each competitor had to declare his average speed before commencing the contest, the rules requiring a minimum of 20 kilometres per hour for single and double-cylinder cars and of 30 kilometres

May next, have just been issued. The contest is open for four-cylinder cars of a bore between 120 and 130 mm., the number of vehicles of any one make being restricted to four. The weight of the machines is fixed at 1,000 kilogs. for those with 120 mm. cylinder bore engines, plus 20 kilogs. for each additional millimetre. A very large series of prizes is again being offered, the winner of the race securing the Targa Florio and a money award of £600, the second taking £320, and the third £160.

A Public Service in Spain.

A public service has recently been inaugurated between Orense and Verin, a distance of 45 miles. Two vehicles are employed, these being of the Brillé 35-45-h.p. type; the bodies, which have accommodation for 20 persons, are of the single-deck pattern, separate compartments being provided for first and second class passengers. Although the route is a very hilly one, each vehicle makes one return journey per day on a petrol consumption of 60 litres, equal to 42 litre per kilometre.

La Coupe des Volturettes.

The seven days' reliability trial of light cars over a 33·8 kilometre course organised by the "Auto" came to an end on Sunday last. For six days the competitors had been making five rounds of a difficult circuit near Rambouillet, forty-one out of the sixty-three which started succeeding in qualifying for the speed contest on Sunday last. This was held on the same course, but nine laps had to be covered, giving a distance of just over 304 kilometres. No less than thirty-one of the drivers succeeded in getting through the race, which, as will be seen from the appended table of results, proved a victory for the Sizaire-Naudin car, driven by M. Naudin.

Order.	Driver.	Car.	No. of Cylinders.	Bore and Stroke, mm.	Time. H. M. S.

The winner's speed works out at an average of just over 40 miles an hour, truly a wonderful pace for a little single-cylinder vehicle. A regularity prize was also offered for the team of three cars which made the best aggregate time. The honours in this case fell to the Lion-Peugeot cars, all three of which finished in a total of 14 h. 43 min. 16 sec. The Sizaire-Naudin team was second in 14 h. 49 min. 32 sec., the Werner trio third in 15 h. 19 min. 13 sec., the Vulpes fourth in 18 h. 8 min. 55 sec., and the Passe-Partout fifth in 18 h. 34 min. 32 sec. Altogether the event proved one of the most successful that has been held in France for a long time, and proved conclusively that modern popular-priced cars are not only reliable vehicles, but are speedy to a degree not hitherto anticipated.

A Trial of Agricultural Motors.

The latest enterprise of our French contemporary, "L'Auto," is the organisation of a competition of agricultural motors. The event is to be held early in November and will be open to: (1) agricultural tractors designed for general haulage purposes; (2) self-moving agricultural machines.

French Imports and Exports of Motor-Cars.

The exports of motor-cars and parts from France during the nine months ending with September last attained a value of £4,357,840, an increase of £220,640 over the corresponding nine months of 1906. During the same period the imports of foreign motor-cars and parts into France advanced from £254,560 to £269,520.

A Fuel Consumption Test.

A somewhat novel motor competition was recently held in the neighbourhood of Bordeaux. The event, which was known as La Coupe de l'Autoloc, was open to all classes of petrol vehicles. One kilogramme of spirit was served out to each competitor, and the exact distance run on this quantity of fuel

carefully measured. The awards were made on a handicap basis by multiplying the weight of the vehicles in running order by the distance covered, the winners being those which showed the highest results. A single-cylinder Sizaire-Naudin two-seated car covered a distance of 17·5 kilometres, and secured 18·6 points—the highest recorded, a Darracq being second with 17·3 points, and a distance of 17·3 kilometres to its credit.

Belgian Motor-car Imports and Exports.

To the end of September last the imports of foreign motor-cars and parts into Belgium had this year attained a value of £135,744, as contrasted with only £118,676 in the first nine months of 1906. During the same period the exports of motor-cars and parts from Belgium increased from £293,028 to £341,472.

More French 1908 Models.

"Le Sport" announces that the Renault Company are introducing a 50-h.p. six-cylinder vehicle for the 1908 season. The other models to be turned out include 8-h.p. two-cylinder and 10-h.p., 14-h.p., 20-30-h.p., and 35-45 h.p. four-cylinder, all having chainless transmission.

Miscellaneous Items.

The new Budget of the Bavarian Government includes a sum of £125,000 for the establishment of motor postal services

Some trials with a Saurer 30-h.p. Single-deck Motor-Bus have lately been made in the mountainous districts of the Southern Tyrol. The above illustration depicts the vehicle at Paneroggio, a little village located 4,920 ft. above sea level.
(Allgemeine Automobil Zeitung.)

in the country.—The annual "Congrès du Calendrier," for the purpose of selecting dates in 1908 for the chief European motor events, so that as little clashing as possible of fixtures may ensue, is fixed to take place in Paris at the Grand Palais on November 22nd.—A new petrol-electric car, known as the GEM, and designed by M. Girardot, will be shown at the forthcoming Salon by the Societe Generales d'Automobiles Electro-Mecaniques.—The Kaiser is adding an electrical motor landaulet to his fleet of automobiles. The new vehicle is being built by the Norddeutschen Automobil und Motoren Gesellschaft, of Bremen.—The President of the Republic has consented to open the Paris Salon on the 12th November.—The Rover Company, Ltd., of Coventry, will be exhibiting no fewer than five of their latest models at the forthcoming Paris Salon.—A Scheibler single-deck motor-bus has lately been put on service between Balcastesti and Bucharest, Roumania.—The medical men in Vienna are reported to be forming a Doctors' Automobile Club.—The question of the dates of the various international motor-car exhibitions, with a view of preventing clashing, is to be brought up by the German Imperial Automobile Club at the forthcoming congress of delegates of the recognised national clubs.—A proposal to construct a motor race track near Coblenz, Germany, is reported to be under consideration.

THE "PERFECTA" CARBURETTOR.

WE illustrate herewith a new carburettor which has been devised by Mr. Frank Smith, of the Empress Motor Company, Manchester, and which is now being fitted to the Empress cars built by this concern. The new apparatus has been designed with a view of obtaining an unvarying proportion of petrol and air irrespective of the speed of the motor or the demands of the latter. As will be seen from the drawings herewith, it varies considerably from the usual practice, inasmuch as the orifices for the petrol and air are maintained in strict proportion to each other by valves operating on the petrol and air inlets. In addition to this an unvarying partial vacuum is maintained in the vapourising chamber C, this enabling the motor to get a suitable supply of gas when running at a very slow speed.

The action of the carburettor will be followed by reference to the sectional elevation (Fig. 1), where E is the jet in which the petrol is maintained at a constant level by means of the usual float chamber S. Sliding in the jet E is a tapering valve needle F, which increases or decreases the petrol supply in proportion to the extra air admitted by way of the conical valve B. When the latter is closed the only air inlet is by the small constant air throat T, and the petrol is supplied in correct proportion to this by the extremely small space surrounding the larger extremity of the needle valve F. Fig. 1 shows the carburettor parts in this position, in which it is capable of supplying a correct mixture for an engine making its slowest possible number of revolutions. As soon as the speed of the motor increases the valve B will open and admit the extra air

FIGS. 1 AND 2.—Sectional Elevation and Plan of "Perfecta" Carburettor.

- | | |
|---|--|
| A. Adjustable part of vaporiser carrying conical air valve. | K. Piston valve control rod. |
| B. Conical air valve. | L. Slots in throttle valve. |

| H. Piston throttle valve. | T. Throat surrounding jet. |
| J. Cover of throttle cylinder. | |

and the needle valve F more petrol, the two valves being so proportioned as to secure absolutely constant ratios.

Owing to the very small throat a slight unvarying partial vacuum is maintained in the chamber C, and by this an equal

flow of air and petrol is obtained which is proportioned automatically by the valves controlling the air and petrol respectively. The exact ratio of the air to the petrol may be varied by raising or depressing the upper portion A, which is screwed a working fit on the vapourising chamber C. This has the effect of bringing a smaller or larger diameter of the tapering needle valve into the petrol orifice and so altering the proportion of the petrol and air. The adjustment when once made takes effect over the whole range of the carburettor, and, no matter whether the motor is turning slowly or fast, the mixture remains constantly weak or strong according to the original adjustment.

SETTING THE VALVES OF A PETROL MOTOR.

AN ingenious instrument to facilitate the timing of the valves of petrol motors has lately been put on the market by the Auto Supply Company, of 1733, Broadway, New York. The device consists of a metal framework A, through holes in the end pieces of which passes freely a long rod B, with a ball weight at the

upper end. As shown in the accompanying illustration, a scale is held between the two end pieces, and is so arranged against a spring in a hole in the lower piece C that by pressing downward it can be released at the upper end and reversed, one side being provided with the metric system and the other with the English. A small piece D can be clamped at any position on the rod B by means of a thumbscrew. The device is used in the following way:—It is placed in a vertical position, so that the base C rests on the cylinder head, and the rod B projects downward through the compression cock hole or sparking plug opening, with its end resting on top of the piston. As the piston descends, the rod B, owing to the ball weight at the upper end, follows the piston, and when the lowest point of the stroke is reached the piece D can be clamped to the rod. When the lowest point of the stroke has been determined, as the piston comes upward the exact distance on the scale before the end of the stroke at which the exhaust valve closes can easily be read. This distance being known, the instrument can be placed in cylinders Nos. 2, 3 and 4, and their variations from the setting of the first cylinder can be instantly seen. In the same way the point in the stroke at which the inlet valves open and close can be accurately determined, and adjustments made until all are alike.

"THREE SPEEDS FORWARD" is not a technical work, but "an automobile love story with one reverse," by Mr. Lloyd Osbourne. It is published by Messrs. Chatto and Windus, who are to be congratulated upon the way in which the work has been produced. We would also felicitate the author on the manner in which he has extended a few ordinary motoring incidents into the length of a modern novel, with its accompanying excitements and interests.

ONE thousand four hundred and one certificates and licences were granted under the Cakutta and Suburban Police Acts during the year 1906, as against 1,353 in 1905. One hundred and twenty-seven private motor-cars and twenty-six private motor-cycles were registered, and 190 and 26 drivers' and riders' licences for motor-cars and cycles respectively were issued during the year. The total number of all certificates of registration issued in respect of motor-cars and cycles to the close of 1906 was 383 and 89 respectively, and there were 304 subsisting motor-car certificates and 73 motor-cycle certificates.

THE New Forest Motor Garage and repair works at Lyndhurst have had a busy season, and are well equipped for useful service to motorists.

MESSRS. W. H. CHAPMAN AND Co. have a motor school and garage in the Attercliffe Road, Sheffield, where they also undertake the repair of vehicles or the supply of spare parts.

AT Dunblane Sheriff Court, James Graham, Achray Lodge, Aberfoyle, has been fined £7 10s. for contravening the Petroleum Acts by keeping 8 cwt. of carbide of calcium for making acetylene gas for his motor-car lamps without having first obtained a licence.

THE City Parcel Delivery Company, of Indianapolis, U.S.A., is preparing to replace a large portion of its horse-drawn equipment with petrol motor delivery wagons. No less than six vehicles have been ordered to start with, and it is understood that the number is to be added to later.

AMONG the latest additions to the varied stock of motor accessories kept by Messrs. G. T. Riches and Co. at their depot in Store Street, W.C., are a new siren trumpet, a triplex tyre pump and a new lock washer known as the "Slack," the use of which prevents any nuts being shaken off owing to vibration.

MESSRS. L. JONES AND Co have an excellent workshop in King Street, Carmarthen, where they are able to execute all kinds of motor-car repairs.

MR. H. W. VAN RADEN has severed his connection with the firm of H. W. Van Raden and Co., of Coventry, and will shortly be starting a factory of his own.

THE Right Hon. Lord Crawshaw has placed an order with Messrs. S. F. Edge, Ltd., for a 40-h.p. six-cylinder Napier car. Viscount Curzon has also ordered a 40-h.p. six-cylinder landaulet.

A MOTOR-CAR worth £450, which its owner, Mr. Bullock, of Clifton, Bristol, thought was safe in its garage, was seen dashing through a Bristol street shortly before midnight on Sunday. It swerved, collided with an electric lamp standard, smashed the pillar to fragments, and was itself greatly damaged. No one could be found in charge of it, and it was at first thought the driver was under the wreckage. On Tuesday, Leslie Johnson, stock-keeper, and Stanley Reed, a clerk, were remanded on a charge of stealing the car. A third man, stated by the police to be implicated by their statements, is still at large.

(Elevation of Chassis of Argyll 40-h.p. Car. (See page 747).)

THE Burlington Art Miniatures, printed by the mezzogravure process, are new-comers for the delight of all who appreciate the art treasures of the world. These are issued by the Fine Arts Publishing Company, and the collection when complete will embrace reproductions of the most famous pictures in British and Continental galleries.

THE Relations Committee of the Royal A.C. met last week to consider the situation arising out of the controversy between the Motor Union and the Automobile Association. After full investigation of the question certain conclusions were arrived at, and it was decided, in view of the terms of reference, to report these conclusions and submit recommendations to the Committee of the Club at its meeting on Wednesday next.

MESSRS. HEPPER AND SONS have recently held, at their Yorkshire Repository, York Place, Leeds, the most important sale of automobiles and commercial motor vehicles which has yet taken place in the North of England, the occasion being the disposal of the new and second-hand cars of the North-Eastern Garages, from the depots at Leeds, Harrogate, York, Darlington, and Newcastle, by order of the receiver for the debenture-holders. The attendance was exceedingly large, and bidding was very brisk. Buyers attended from various parts of the country, and all the cars offered were sold. The amount realised, with a few cars sold privately before the sale, was over 5,000 guineas.

THE Renard road train has been giving a series of demonstrations of its utility in agricultural districts in Ireland, one of the most interesting taking place in the grounds of the Exhibition in Dublin. Following the proceedings a meeting of representative men was held under the presidency of Lord Mayo, at which Lord Ribblesdale, chairman of the Renard Road and Rail Transport Corporation, pointed out the advantages of the system, and a committee was formed, with Lord Mayo as chairman, to consider the best means of securing the system for use in Ireland.

"MAGNETOS for Automobilists: How Made, and How Used," is the title of a new work which has just been published by Messrs. Crosby Lockwood and Son. It is from the pen of Mr. S. R. Bottone, who intends it to form a handbook of practical instruction in the manufacture and adaptation of the magneto to the needs of the motorist. In a series of six chapters the author deals very fully with the subject, treating successively with the component parts of magnetos, magnetisation, armatures, &c. Both the low and high-tension systems are discussed, the principal types at present in use being described and illustrated. In the last chapter Mr. Bottone gives a few practical hints, and concludes with a comparison of ignition by high and low tension magnetos, the author's preference lying in the direction of the latter. In view of the increased adoption of magneto ignition on automobiles, the book is one which should be found useful by many motorists.

"SUNNY WORTHING" is the title of an excellent leaflet issued by the local Borough Association.

THE Daimler Company have recently shipped to Mr. Tan-Tat-Yan, a wealthy planter of Malacca, a Daimler car of the Canley type, fitted with a Cape cart hood.

MUCH information that is interesting, and much that is even curious and quaint, is given in the report on the British Central Africa Protectorate for 1906-7 just issued by the Colonial Office. A striking sign of the march of civilisation is the substitution of motor traffic in place of the usual method of transport. We read: "There are several motor-bicycles in use in this Protectorate, so much so that an association styled the 'Motor Union of Nyassaland,' for the encouragement of motoring, and for the general advancement of the movement in this country, has recently been inaugurated. The society assists members to import petrol, machines, and other essential accessories."

AT 10 and 12, Heddon Street, a well-known thoroughfare to the rear of Regent Street, London, W., the Motor Schools, Ltd., have established a well-equipped academy for the complete instruction of prospective motorists. The lecture halls are replete with the chassis and various parts of motor-cars, several well-known makers having sent typical examples of their work upon which pupils will be instructed in the use of various parts of the car. Several cars are available for driving instruction, and

the courses of study are arranged with a view to the convenience of pupils, both as regards class tuition and private instruction. We give a view of the main lecture hall, which will indicate the thoroughness with which the school is being started. Mr. Turberville Smith is the managing director, and Mr. Llewellyn Morgan the general manager, these two gentlemen being assisted by a staff of well-known motor engineers.

THE Brooklands Automobile Racing Club have resolved that they will only acknowledge and entertain such challenges as are issued through the medium of the club secretary, and that the fact of any challenge (in which the Brooklands motor course is mentioned as the deciding ground) being issued to the Press without its having been submitted to and approved by the club may debar such challenge from being decided on the Brooklands motor course.

THE death is announced of Mr. E. W. Wells, one of the founder members of the Nottinghamshire A.C., a vice-president, and chairman of committees from the inauguration of the club in 1900. Mr. Wells for the past twelve months has not been able to attend to any business, and has lived at his house at Skegness for that time. He always took the deepest interest in the affairs of the club, and was present at nearly every meeting, either winter or summer. The funeral took place on Thursday of last week, when the president (Mr. Chas. Hardy), Mr. A. Barlow, and Mr. Booth Granger (hon. sec.) were present on behalf of the committee of the club.

ATTEMPTS are being made at Inverness to secure a restriction of the speed of motor-cars, despite the fact that there have been no convictions under the Motor Car Act in the borough.

GOOD roads have been made on Osea Island, which is being developed by Mr. F. N. Charrington, and motorists are being invited to look over this interesting corner of Essex when in the neighbourhood of Maldon.

THE Daimler Company have sent us a copy of the Instruction Book they are issuing to all users of Daimler cars. The work gives a very clear description of the various portions of the chassis and the attention they require, the information being elucidated by drawings and sketches. Of special utility are the illustrations showing the parts which require lubrication. The book, which is of a size that can be conveniently carried in the pocket, should prove indispensable to those owning and driving Daimlers.

THE Electric Ignition Company, Ltd., of Birmingham, have sent us a copy of the E.I.C. "Wiring Map" they have just issued. This is an exceedingly useful production, giving as it does very clearly prepared diagrams showing the methods of arranging the ignition wiring, where accumulators and coils are used, for single, double, three, four, and six-cylinder engines. The firm inform us that they will send gratis a copy of the map to any motor-car agent or interested motorist. For a small charge a more durable map with rollers and mounted on canvas can be supplied.

MR. J. E. GARRATT, of the Veedee Company, 96, Southwark Street, London, S.E., has brought to our notice an ingenious device for gauging the height of the lubricating oil in the base chamber of petrol engines. The apparatus, which is known as the Oleometer, is so arranged that, by pressing a switch, a red electric lamp on the dashboard will glow if the crank chamber has received too much oil, while if there is an insufficient supply this will be indicated by a white light in a second lamp. In this way trouble due to either over or under lubrication can easily be avoided.

THE auction sales of motor-cars at Brooklands were successfully inaugurated on Saturday, when Messrs. Hampton and Sons brought nearly forty cars to the hammer. Notwithstanding the deplorable weather, which quite demoralised the railway facilities, a goodly company assembled. All the morning prospective buyers were taking full opportunity of testing their proposed purchases, evidently appreciating the first chance that has been afforded them by a run round the course of really testing the merits and demerits of a second-hand car before purchasing. Although prices appeared to be generally quite satisfactory, not a few bargains were to be got. Messrs. Hamptons were so satisfied with the result that they have decided to hold the second sale at Brooklands on Wednesday, the 20th inst.

AT the autumn meeting of the Association of Municipal Corporations, held on Saturday in London, among the subjects dealt with was that of the speed of motor-cars. The question was raised by the Mayor of Maidenhead, who moved:—"That the attention of the Association be drawn to the undue speed of motor-cars, the noises caused by the hooters, and the emission of vapour—all of which are a source of annoyance to the public at large; and that the subject matter of the resolution be referred to the Law Committee for consideration and report to the council." Mr. Alderman Martin, of Reading, seconded. Sir Homewood Crawford, solicitor to the City of London Corporation, did not consider the resolution strong enough. He proposed that the attention of the President of the Local Government Board should be called to the undue speed of motor-cars and the other points mentioned in the resolution, and that these should be described, not merely as a "source of annoyance," but as a "danger to the public at large." Instead of referring the subject to the Law Committee of the Association, he moved that it was one "urgently requiring the attention of His Majesty's Government with a view to fresh legislation." The Mayor of Maidenhead accepted Sir Homewood Crawford's amendment, and the resolution, strengthened in this way, was unanimously adopted.

THE "SEDAN" MOTOR CAB.

AN exceedingly novel design of motor-cab chassis is being put on the market by the Sedan Auto Car Syndicate, Ltd., Lichfield Street, Wolverhampton. As will be seen from the accompanying illustration, the frame is in two distinct parts, the engine and transmission gear being all supported on the forward frame, the front pair of road wheels acting both as steerers and drivers. The two parts of the frame are connected together by a hinged connection so arranged that while perfect rigidity is ensured each pair of road wheels can be turned in a similar manner to the "lock" on a horse-drawn four-wheeled vehicle. Among the advantages claimed for the new design is the fact that the car can be turned in a very small radius, and that it works amongst traffic with perfect ease and safety; the risk of skidding is practically eliminated, the drive being on the front axle, and the engine, gear-box and all driving and steering gear, together with the driver's seat, being also mounted on the forward pair of wheels. There is a considerable reduction in the vibration, with consequent reduced cost of upkeep of engine and gear.

Chassis of "Sedan" Motor-Cab.

The back portion of the car, being essentially a trailer, is well hung on springs with long centres, and as there are no working parts underneath, vibration is reduced to a minimum, and solid tyres can be used. The front chassis is self-contained and forms an *avant-train*, which can be used with several types of bodies, as, for instance, with a brougham, an ordinary open car body, char-à-banc, or light delivery van. An experimental cab has, we are informed, been run in London for about eight months, and has not only proved its adaptability for crowded traffic, but is able to turn in a circle of a diameter of 21 ft., or 4 ft. less than the police requirements.

The Sedan Company are also introducing a new change-speed gear known as the Wirtz, which comprises several novel features, and to which we hope to refer in a later issue.

THE Adams Express Company have lately put eighteen one and two-ton electric motor-wagons in operation in Indianapolis, U.S.A., and on the same day withdrew twenty-two horse-drawn delivery vehicles which have been in use in that city for many years.

SOME USEFUL NOTES.

Now that the frosty period of the year is approaching, and with it the danger of burst cylinders and radiators, owing to the freezing of the water, the following anti-freezing solution may be of service:—Use $4\frac{1}{2}$ lbs. of pure calcium chloride to a gallon of warm water. Mix and filter before placing in radiator or tank. Replace evaporation with clean water and leakage with solution. This is a solution which is largely employed in the United States; in this country, however, glycerine is considered the most convenient preventive. The usual method is to add about 20 to 25 per cent. of commercial glycerine to the cooling water.

If there is a chance in the circulating system for water to remain in pockets after draining the system, to prevent freezing it is a good plan to start the motor and run it on a small quantity of gas and slightly advanced spark while the water is running off. This will tend to clear the pockets, and the heat of the motor will evaporate any water remaining in the jackets.

Of course, the motor should be stopped before it gets very hot. In case the pump is of the positive or gear variety, a better expedient is to disconnect the hose close to the pump between the pump and the water-jacket, after draining off the water elsewhere, unless there is a drainage cock provided for this purpose. The reason for this is that the positive pump will force water to the engine as long as water comes to it, and this water will be unable to run back through the pump. In cases where the carburettor is warmed by circulation of water, care should also be taken to see that it is properly drained.

MOTORISTS whose cars are fitted with radiators provided with air-inducing fans should give a little attention now and then to the belt of the latter. It should not be allowed to become so loose that the fan does not rotate as rapidly as it should, and consequently does not draw as much air through the radiator as when the belt is tighter. To run these fans at high rates of speed requires more power than is generally imagined, and if the belt becomes too slack slipping at once results, particularly where round belts are run on pulleys fitted with V-grooved rims.

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

SIDE-ENTRANCE CARS A MISTAKE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The pictures of a remodelled car recently given in the *M.C.J.* are a curious example of the lengths to which votaries of "fashion" will resort. A rear entrance is fashionable in private omnibuses, wagonettes, governess carts, &c., why should it be banned in a motor-car? Recently I chose a tonneau in preference to a side-entrance, and I should always do the same in the future, as a practical experience of both has convinced me the rear entrance tonneau is the best arrangement for a motor-car.

Compare the side-entrance in Fig. 2 of your illustrations. The wheel base is so long as to be inconvenient in turning and unhandy in traffic as well as a new source of danger, as evidenced by the recent numerous accidents (unknown before) of long-wheel base cars overturning with fatal results when trying to negotiate sharp corners. Side draughts (absolutely unknown to the tonneau) as the plague of wind sweeps side-entrances and lifts the rug so as to render hooks necessary to keep it down. The delightfully handy and smart looking long side-baskets are impossible in a side entrance, a loss for which nothing compensates; while luggage at the rear induces side-slip, and the projection of the

many motorists. There are, however, some advantages to be claimed for the side entrance, and we shall be glad to have the views of those automobilists whose favour lies towards the modern type of body.—ED.]

BENZOL AS FUEL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been much interested in reading Mr. Edge's tests of benzol on the six-cylinder Napier car, and I think you will be interested to hear that my experience with this spirit on my 10-12-h.p. Coventry-Humber car has more than exceeded my anticipations. I have been using a mixture of seven gallons of benzol to three gallons of petrol, with the result that not only have I been able to save some 20 per cent. in the price of the spirit, but at the same time have driven 21½ miles on a gallon over give and take roads as against my previous best of eighteen miles to the gallon on pure petrol. I would mention that my road test was from London to Bournemouth, and I did the distance (recorded by my milometer) of 214 miles on my tank, which holds ten gallons, and that the results I have obtained are without making any alteration whatever to my carburettor. Person.

La Coupe des Voiturettes.—Two of the Competitors Passing through Hamieres in the Final Speed Trial.

hood beyond the rear (see Fig. 2) constitutes an added danger. All side-entrance car doors rattle after a few months' use. A side-entrance car is heavier by an additional person's weight than a tonneau, and tyre troubles are more frequent. The rear of the car, the most important part in a fast-travelling vehicle, is out of observation in a side-entrance, and trouble with extinguished tail-lamps and mud splashed number plates "out of sight and out of reach," is more probable, to say nothing of collision with an overtaking car from behind.

A tonneau, with the middle seat down, can at will have the continuous seat and accommodation of a side-entrance, while it has the unquestionable advantage over the latter of having extra space always available between the exceptionally comfortable corner seats, when the middle seat is up, thus giving the choice of a sideways position as a welcome change from the forward, when so desired.

Concerning the stuffy and noisy interiors of the many forms of permanently closed limousine and similar bodies now in vogue, I need say nothing, as passengers therein lose all the unique joy of motoring and might as well be imprisoned in a railway carriage. To sum up, a rear entrance tonneau is free from all the many disadvantages of a side entrance, the present craze for which is so great a mistake, and a personal experience of both leads me to give the unhesitating preference to the tonneau.—Yours truly,

COMMON SENSE.

[Our correspondent brings forward some strong arguments in favour of the rear entrance tonneau, which is now looked upon as out of date by

ally, I am very thankful indeed to Mr. Edge and his Napier test for bringing this spirit into prominence, and in such a disinterested and sportsmanlike way, for the benefit of motorists generally.—Yours truly,

WILLIAM HENRY WHITE.

THE ATTITUDE TO MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My attention has been called to a paragraph under the heading of "Comments" in your issue of October 5th, in which you state, referring to "A Rector's Charitable (?) View," that Mr. C. H. Harrold opposed any alteration which would give further facilities for motoring at a high speed, and, better than the reverend gentleman, added he only hoped all the motorists would kill themselves. He was against spending a penny of the ratepayers' money in facilitating the motor traffic. You then go on to comment on the wickedness of any such expression, and say that "it ill becomes an advocate of peace and goodwill to hope, as did Mr. C. H. Harrold at that meeting, that 'motorists would kill themselves,' and they are not likely to do that; but we trust Mr. Harrold will keep on the grass of the side-walk."

I have to inform you that your statement that "I hoped 'all motorists would kill themselves' is absolutely false, and has caused me the greatest possible pain and annoyance, I am not concerned with the source of your information, nor am I called upon to express

any opinion as regards the propriety of any such utterance, if actually made by anyone else.

I, in common with many residents in country villages near London, suffer extremely through motor traffic. Our roads are rendered dangerous, our hedgerows, gardens and houses filled with dust, and our rates increased by the lowering of the value of houses fronting on the main roads, and the additional expense caused by passage of motors using the highways, and while I admit that many gentlemen owning and driving motors use them with every consideration for the inhabitants of the villages through which they pass, they are, unfortunately, but a small minority.

I am sure that you will, in justice to me, insert this letter in your next issue, and offer some apology to me in the same column of your paper wherein this libellous statement appears.—Yours truly,

CHAS. HY. HARROLD.

THE BRITISH AIRSHIP AND FOREIGN ENGINES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, Mr. Brett, challenges my statement that British engines are quite as good as, if not superior to, any foreign ones, and he desires me to substantiate my assertion. I will do so with pleasure. In the recent Gaillon Hill climb competition—one of France's most important automobile tests—a team of three six-cylinder Napiers swept the board and won three firsts. In the "sans limitation" class, which was open to the fastest cars in the world, six cars competed, including a Mors, Darracq, and Mercedes, but the English Napier defeated the lot besides climbing the hill in record time. Again, on October 12th, a 60-h.p. six-cylinder Napier attained a rate of speed of 91.37 miles per hour on the Brooklands racecourse, as certified by the official timekeeper. Now, Sir, these incontestable facts must make people realise that the best British design and workmanship, even if equalled abroad, certainly have no superior on the Continent.—Yours truly,

H. F. TRIPPELL.

THE SLIP OF THE CLUTCH.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "H.'s" letter in yours of the 19th ult., to leave the clutch in in all cases of traffic and in hills and corners sounds very much better in theory than in practice. I have had a car, English make, leather-faced clutch, in constant use for three years. The same leather is now on as the maker supplied with car, and it is still in thorough good condition. With regard to using brakes on hills with clutch out, the same applies to corners and over rough portions of the road. But engines are not designed as brakes; if so, why are the makers so particular in putting efficient brakes on the market?

I should say, take hills slowly, handle brakes gently, with clutch out, otherwise quite unnecessary wear and tear in main journal bearings and gear-box will soon appear.

I would like to read others' opinions.—Yours truly,

A. R.

WHAT IT COSTS TO KEEP A CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an interested reader of the *Journal*, but one who is not yet the possessor of a motor-car, I venture to ask those who have had experience to let you have for publication in these columns particulars as to the expense of running and upkeep of a small vehicle. I believe there are many motorists who keep a record of their running expenses, and if only they will allow the same to appear in print it might assist many who are at present waiting to make the plunge. Nowadays all high-grade cars, I believe, can be relied upon to give good service, and if the cost of the car, horse-power, number of cylinders, speeds, chain or cardan drive, size of tyres (pneumatics or solids) were mentioned, these would form sufficient guidance to would-be motorists.—Yours truly,

BEDFORDIAN.

THE PRESENT SYSTEM OF TRANSMISSION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Hirsch's letter in a recent issue of the *M.C.J.* opens up a field of discussion, and is in many respects only too true. Many of the good machines built by persevering, ingenious mechanical engineers are now passing out of recognition, and are classified as freaks. But the trend of motor design will undoubtedly find its way back into the old groove of originality, which will bring in its train finality and perfection. Cars as a rule are not too complicated, but they are decidedly ungetatable, chiefly on account of makers giving detail insufficient attention.

I venture to prophesy, despite the ridicule I shall most assuredly be greeted with, that the car, the gentleman's carriage of the future, the most enduring, efficient, simple and silent vehicle, will have only four cylinders, separate, and these air cooled, which, if fitted with auxiliary exhaust valves—on which I have already expressed my opinions in the *M.C.J.*—a flywheel of large diameter and medium weight, with large air-inducing vanes instead of being solid, and inverted venetians in the place of the usual radiator, and possibly air distributors within the

bonnet, a carburettor of adequate capacity to deal with four warm but clean and empty cylinders would give the car a real resilient motion like that of a steam car under the most favourable conditions—a natural thermal efficiency.

Wire wheels, with detachable side rims, will of course come into vogue if only on account of their strength and elasticity, and helical reduction gears with internal expanding clutches of reasonable dimensions, vertical cylinders for me always, and a final drive on the Dennis principle except from a propeller shaft which gradually assumes a larger diameter up to half its length and then tapers down again towards the differential casing. Bevel gear drives absorb too much power; and chains I am sure will die a gritty, rattling death. The orthodox change-speed lever together with the gate and quadrant must be discarded, for both hands are required at the reins of a fast and lively horse; and I consider the same is required at the wheel of a similar car. The Daimler Company show that they have arrived at years of discretion by putting the brake lever in the right place to be dropped on immediately for emergencies.

A perfectly flat top to chassis, thus pressure fed (petrol, if it is still used) will predominate, forced lubrication, oilers for everything, even the springs, and shackles of same. Automatic air inlet valves on the induction pipe, close to the carburettor. The engine governed on the throttle, with a foot accelerator so arranged that when up the air valves and throttle are closed and the carburettor working in its ordinary way. Three point suspension on double bow springs, and pneumatic shock absorbers, whose bye duty it should be to store air at a given pressure, &c. A small winch so constructed as to retain the body at any angle, thus giving proper access to the working parts requiring adjustment, whilst the bonnet should be made on the principle of the roll top desk.

These are, I believe, the kind of improvements that will be embodied

Mr. Harry Sell, of Silver Street, Bedford, is using a 6-h.p. car in connection with his business as a Fishmonger and Gamekeeper.

Mr. Sell informs us that he has had the car about six months, and not only does he find it an excellent advertisement, but also a great advantage over horse-drawn vehicles for what he terms "the out town work" he having a large number of customers in the suburbs of Bedford.

In the car when it is looked upon as the cycle is now, but it will not engross the minds of those firms who have their shops stocked with patterns and castings for the standard car of to-day; nor of those people who have shares in these firms, but rather of those enterprising persons with the capital and ability to place up in the market such a simple and reliable vehicle as I describe.—Yours truly,

HERBERT J. CHAPMAN.

AN EXHAUST VALVE QUERY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you or any reader of the *M.C.J.* inform me what should be the clearance between the exhaust valve stem and the tappet? Should this be equal to that between the inlet valve stem and its tappet? The engine is a 12-h.p. twin-cylinder.—Yours truly,

W. T. PHILLIPS.

[As the exhaust valve stem gets hotter, and therefore expands slightly longer than that of the induction valve, it should of the two have rather more clearance. Adjusting them up with only a small space reduces noise, but, on the other hand, racing cars have often a fairly large one. About 1.32 in. to 1.16 in. space should be allowed; but it must be borne in mind that the timing is retarded by increasing the space on the opening and advanced as to closing. This must be remembered, and in no case should the valve have a clear "lift" of less than a quarter of its effective diameter. If the engine has been timed as to its valve setting by the makers with 1.32 in. clearance, there will probably be a loss of power if this is increased.]

CLUBS AND ASSOCIATIONS.

AUTOMOBILE ASSOCIATION.

THE authorities of the Paris Salon have allotted a room in the Exhibition for the convenience of members of the Automobile Association and Motor Club visiting the Exhibition. The room is conveniently situated close to the Salon de l'Automobile Club de France. A member of the A.A. staff, who speaks French, German and English, will go over from the head offices, and be in attendance daily during the Show. Members of both organisations are informed that appointments can be made, and letters, telegrams, &c., addressed for their convenience, c.o. Automobile Association or Motor Club of London, Exposition de l'Automobile, Paris.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

A MEETING of the Council of the Incorporated Institution of Automobile Engineers was held on Tuesday of last week. The Secretary reported that the Institution had been incorporated and a licence obtained from the Board of Trade to omit the word "Limited." It was also announced that Mr. L. A. Legros had accepted a seat on the Council to fill the vacancy caused by the decease of Mr. Alec Govan.

The following were elected members of the Institution:—Messrs. H. P. G. Brakenridge (London), A. Marsden (London), B. H. Morgan (London), E. A. Rosenheim (Paisley), R. O. Legg (London).

HUDDERSFIELD BRANCH Y.A.C.

AT the annual dinner of the Huddersfield Branch of the Yorkshire A.C. on Friday, the 25th ult., Alderman W. H. Jessop, the president

Mr. W. Atkinson, the Blackpool and District Agent for Daimler Cars, on his 55-h.p. Daimler.

of the club, occupied the chair, among his supporters being Messrs. A. J. Sherwell, M.P., W. P. Raynor, J.P., E. H. Hepper (Leeds), K. F. Campbell (borough engineer), and E. Gordon Learoyd (hon. secretary to the club). After the loyal toasts Mr. A. J. Sherwell, M.P., proposed that of "The Yorkshire A.C." He strongly deprecated the habit of establishing police traps along roads where there was no danger to the public, and where no charge of reckless driving could be held to be tenable. He believed in the necessity for a speed limit inside towns and villages, but he strongly objected to the imposition of a speed limit and to the establishment of police traps on public roads and highways, where there was no conceivable danger to anything greater than a stray chicken or dog. As far as his views went, he would abolish that arbitrary speed limit on open public roads. He (the speaker) was entirely with them, and would lend his influence in the direction of securing the abolition of an arbitrary speed limit, and the deprecation of those mischievous police traps where no danger to the public might accrue, though at the same time he should be firm in maintaining the speed limit in towns and villages.

Mr. E. H. Hepper, in responding to the toast, said that motorists were not the black "road hogs" some people would have them believe, and they were only wishful to do what was right in their own sight and in the sight of the public in their motoring affairs. He referred to the work of the Yorkshire Club, of which he was chairman, and expressed the opinion that the efforts of various organisations would result in stopping the terrible dust nuisance. With regard to roads there had been a marked improvement, and the borough surveyors were taking all precautions to see that their under-surveyors and road men were doing

their duty. He also urged that it would be an advantage to every road user if all vehicles were properly lighted in the rear, as well as in the front.

Mr. W. P. Raynor submitted the toast of "The Huddersfield Branch of the Yorkshire Automobile Club," which, he said, was formed for mutual protection and for social intercourse. The President, who responded, said the object of the club was to encourage members to observe the law of the country, and to do nothing that would bring into bad repute motoring or motorists. There were 300 motor-cars and motorists in Huddersfield, and about one-half of that number were members of the club.

Mr. E. G. Learoyd gave the toast of "The Visitors." Mr. K. F. Campbell made a suitable response to the toast.

NORTH WALES.

AN important meeting of the Roads Committee of the North Wales Automobile Club has been held at Corwen, when there were present:—Mr. J. W. Wyatt, Cae Synamon, Carnarvon (chairman); Colonel O. Lloyd; Mr. Evans, Broom Hall; Colonel Sandbach, Abergelle; Major Turner, Flintshire; Mr. H. B. Davies, Treborth; Mr. S. T. Chadwick, Beaumaris; and Mr. J. H. Burton, together with a number of the Road Surveyors of North Wales, who had been invited to attend, and many of whom had motored from the various counties for the purpose.

The Chairman gave figures showing that the roads of North Wales cost in maintenance less than half those of the border English counties.

The Surveyors, while generally promising attention to matters of importance to motorists, pointed out that several useful matters devolved upon others. The lopping of trees and trimming of hedges in fences adjoining roads was the duty of owners or occupiers; the efficient renewing of pipe trenches devolved upon the gas, water, or sewer authorities who made them, and while motor-cars wanted small metalling, motor lorries and traction engines needed large metalling on the same roads. Scarifying adopted as a system would largely increase the cost of road repairing.

Mr. E. Evans, the County Surveyor of Carnarvon, proposed a vote of thanks to the club, in the course of which he said there were about 250 cars and cycles registered in the county. These had cost their owners, say, £50,000, to purchase, and had contributed some £500 to the county rates. The county, to meet the requirements of this traffic chiefly, had spent in various ways a sum of £5,000 on 250 miles of roads. In other words, they had spent ten times as much as they had received directly from motor-cars. If they took as typical the road through Beddgelert to Capel Curig, a length of fourteen miles, they found the rainfall to be 190 inches a year. This heavy rainfall was a factor to contend with in the repairing of roads when compared with the average rainfall of forty inches in England. The strip of road had been motor signalled at a cost of £10. By Portreuddyn they had reduced a hill in rock, and widened the metalled part at the corner at a cost of £30. A protruding rock at Aberglaslyn had been partly removed at a cost of £10. Brynyfelin bend had been eased at an expenditure of £50. The narrow road and bend by the old mill, Beddgelert, had been widened at a cost of £20. The sharp corners at Clogwyn Gysgfa and Penygwryd were now being cut at an outlay of £25. Penygwryd Bridge has been strengthened for motor lorries at a cost of £50. The swampy foundations on the Penygwryd length had been drained at a cost of £25. The rocky protrusions in the surface had been blasted or removed at a cost of £30. So that motorists had not been badly treated by the authorities of the district.

SOUTH DEVON.

MR. F. B. MILDMAY, M.P., presided at the annual dinner of the South Devon Automobile Club at the Royal Hotel, Plymouth, on the 23rd ult. Others present included Mr. W. E. P. Bastard (chairman), Mr. R. H. Lucy (deputy-chairman), Col. J. W. Robyns, Capt. H. de la Coudamine, Dr. G. F. Aldous, Dr. W. H. Waterfield, Dr. Fox, Messrs. G. S. S. Stredre, D.L., J.P., S. J. Lawry, C. G. Eve, C. J. Payne, E. Parsons, C. R. Fox, P. T. Pearce, R. Bromhead, H. R. Shires, J. J. Bayly (vice-president), A. R. Dobnam, R. Bayly, H. G. E. Cross, E. H. Miclewood, and A. E. Nias (secretary).

In proposing the toast of "The King, the Queen, and the rest of the Royal Family," the Chairman said his Majesty had always done his very best to encourage the manufacture of motors in his own country.

The Chairman, proposing "Success to the South Devon Automobile Club," said their object should be to promote the careful driving of motor-cars, with every consideration for the safety and convenience of the public. It was one of the functions of the club to work hand in hand with those anxious to put an end to the undoubted grievance to the general public in connection with motor-cars. There had been very great improvement in England with regard to driving, but even now the methods of many chauffeurs caused him to shudder. Motor-cars were in excess of good drivers. Some owners of motor-cars were disposed to express surprise because motor-cars were to some extent unpopular in the country. With the roads constituted as they were at present it seemed to him that the dust in many cases was positively insufferable, especially in those trunk roads which came out of London. Especially were they a nuisance to the owners and occupiers of roadside property. Motorists could truly say they did not make the dust. They only

raised the dust produced by the pounding of horses' feet. The present speed limit had not been a great success, and it seemed to him in many parts of the country the police were going the wrong way to work. He did not say that that was in Devonshire, because he was happy to think they were blessed with an intelligent police, but in some parts of the country they had a system of timing a man's progress by the hour, basing their calculation on one-sixteenth of a mile. It was apparent that the slightest mistake on the part of the policeman must falsify the whole of his calculations. That was not a fair way of timing the rate at which a man was going per hour. He would like to see the police throughout the country devoting themselves more to the stopping of driving to the public danger, because that should be put an end to. His friend, Mr. Bastard, had been untiring in his efforts on behalf of the club. He initiated the club, and he entertained the club very kindly in that beautiful country, the Buckland Downs, the other day. He was glad to think that the club was prosperous in every way. They had got a good name, and meant to keep it, and he was quite sure the work they would do would be welcomed by all sections of the community in South Devon.

Mr. W. E. P. Bastard, in response, said the club might consider itself the father of automobilism in Devon. The family was now a large one; they had between 130 and 140 members. They could depend upon their president to see that, at any rate, their side of the question was fairly and squarely put before the House of Commons. He was perfectly certain that the future of automobilism rested very largely with themselves. The club had had a most successful hill-climbing contest. They had put up caution signals in the neighbourhood, and would have to put up a good many more. By Act of Parliament that was the duty of the County Council, but the County Council had been completely deaf to all remonstrances on the subject. Signs were not wanting that enlightenment was slowly coming in that direction, and the United Devon Association was now working with the South Devon Automobile Club in the hope of inducing the County Council to do what was their obvious duty.

Mr. Strode proposed "The president," and said they should bring the greatest possible pressure upon the County Council for the Devonshire roads and lanes were not the safest places for driving. The Chairman, in response, referred to their great indebtedness to Mr. Nias, the secretary, who had worked hard for the success of the club.

Mr. Nias thanked the president for his kind reference, and the proceedings then closed.

SCOTTISH.

A HILL-CLIMBING test confined to cars owned by members of the Scottish A.C., and driven by the owner or a member of his family, took place on the hill leading out of Fintry towards Lennoxton on Saturday afternoon. The test was made over about 1,900 yds. of road of an average gradient of 1 in 15. The event being purely a private and sporting one no formula was used and no prizes given. Mr. A. G. Rennie and Mr. John M. Ross acted as timekeepers, and the following were the best times made, the time of the fastest car being represented by X:—

	Seconds.
Mr. Jack Murray's 40-h.p. S.P.A. ...	X
Mr. J. H. Paterson's 30-h.p. Peugeot ...	x + 14 3-5
Mr. A. Forrester Paton's 40-h.p. Napier ...	x + 30 2-5
Mr. Thomas Shaw's 30-h.p. Siddeley ...	x + 33 4-5
Mr. Harry Prosser's 30-h.p. Siddeley ...	x + 39
Mr. Andrew Sharpe, jun.'s, 28-43-h.p. Daimler ...	x + 39 4-5
Mr. Hugh Kennedy's 20-h.p. Ailsa ...	x + 67 2-5
Mr. J. W. Morton's 16-20-h.p. Mays ...	x + 73 4-5
Mr. L. C. Seligmann's 24-h.p. Gladiator ...	x + 91 3-5
Mr. Robert Thom's 10-12-h.p. Humber ...	x + 113
Mr. J. W. Scott's 10-12-h.p. Humber ...	x + 115

THE ORGANISATION OF MOTOR-CYCLISTS.

A CONFERENCE between the committee of the Auto Cycle Club and the eight representatives of the motor-cycle clubs appointed at the Lincoln Conference was held at the Black Boy Hotel, Nottingham, on Saturday, Mr. R. Todd presiding. It was decided to hold the next meeting of the A.C.C. Council in London, on Saturday, November 23rd, when the question of the constitution of the A.C.C. will be further considered. The conference recommended:—

- (1) That the name be altered to the Auto Cycle Union.
- (2) That the social programme be dropped.
- (3) That the present arrangement between the A.C.C. and the Motor Union be reconsidered and dealt with as may be decided by the old council.
- (4) That the question of the reduction of the affiliation fees be considered and determined by the old council, the committee of eight to place before it a report and recommendation on the subject.
- (5) That the next council meeting be the last of the year.
- (6) That a meeting of the council of the new body be held as early as possible in the new year, but not later than February, at which meeting all officers be elected.

The place of meeting and time will be fixed by the council at the meeting next month.

CASES UNDER THE MOTOR CAR ACT.

MANY ENDORSEMENTS.

HEAVY penalties have been inflicted by the Kingston County Bench upon Archibald Gray, of Guildford, who was summoned for having driven a motor-car at an excessive speed, and for having failed to have the identification plate illuminated, at Esher, on the 10th ult. Supt. Marks said there were three endorsements on the licence, and defendant had been fined sums of £20 and £11. Fines of £10 and costs for the first offence, and £3 and costs for the second, were imposed.

THE ENDORSEMENT OF LICENCES.

Before Justices Phillimore and Walton, Mr. H. A. M'Cardie moved for a rule nisi calling upon the justices of the Northfield Division of Worcestershire to show cause why an order made by them endorsing the motor licence of Mr. Moffat should not be brought up and quashed on the ground that it was made without jurisdiction. In August last, counsel said, his client was summoned under the Highways Act, 1832, for causing an obstruction by leaving his motor-car on the highway for forty-five minutes. The justices convicted him, and under Section 4 of the Motor Car Act, 1903, endorsed his licence. He (the learned counsel) contended that the justices had no jurisdiction to endorse the licence, as the section related only to driving offences, and not to offences of obstruction. The justices appeared to think that as the motor-car had been driven to the spot where it was left they had power to act on the section which provided for the endorsement of licences. The point was of great importance, because if the order of the justices was allowed to stand it would open up an enormous field of endorsement. Their lordships granted a rule, Mr. Justice Phillimore remarking that he did not give the applicant much encouragement.

That the development of the motor body building trade is not being confined solely to large centres is apparent from the fact that as far north as Aberdeen the British Motor Body Company, Ltd., are carrying on at their Bannermill Works an extensive business in motor bodies. The above illustration depicts a 30-40-h.p. Fiat, fitted with a three-quarter landaulet body, they have built to the order of Messrs. Rennie and Prosser, Ltd., Glasgow.

NO REAR LIGHT.

A chauffeur, who was summoned at Otley for driving a motor-car without showing a red rear light, pointed out that according to law he was only required to show a red rear light, and that on the night in question his side lamps were lighted, and in each of these lamps there was a rear red pane of glass. The Police Superintendent admitted that the defendant was technically complying with the law on the point. Of course there would be the question of showing the identification plate, but this had not been raised. The case was dismissed.

EXCEEDING LEGAL LIMIT.

John Todman, chauffeur to Mr. Joe Elvin, has been summoned at the Bromley (Kent) Police Court for exceeding the legal limit along the Maidstone road. Two police constables who gave evidence for the prosecution stated that the car covered the measured furlong at the rate of thirty-three miles an hour. Mr. William Taylor-Parkes, of the firm of solicitors who act for the Automobile Association, appeared to defend. It was elicited in cross-examination that the car was not stopped, as the constable who had been placed to stop the cars was at the other end of the trap, but a constable stated that he had called upon the owner and informed him that his driver would be summoned for exceeding the legal limit. The solicitor contended that he had no case to answer, and pointed out that under sub-section 2 of section 9 warning must be given of intended prosecution either at the time the offence is committed or be sent within twenty-one days afterwards to the owner of the car or to the driver, this last clause implying that it must be a written notice. The Bench upheld this contention, and the Superintendent of Police asked for an adjournment on the ground that the ordinary written notice had

been sent and that he could give proof of this. The Chairman refused the request and dismissed the summons.

HEAVY HAULS.

Five motorists were fined £26 and costs at Huntingdon, on Saturday. Before the Arundel County Bench fines of £5 each have just been imposed on half a dozen drivers of cars. Several batches of motorists have been before the Bromley (Kent) sessions lately. Five convictions have just been recorded at one day at St. Helens. At the Blifield Petty Sessions several motorists have been fined for exceeding the legal limit. Three motorists have been convicted of similar offences at the Stratton Police Court. At Ayr Sheriff Court, fourteen motor-car drivers have just been fined £67 for exceeding the speed limit.

The 40-h.p. Daimler Car which the Wolseley Company have recently supplied through their Bombay Agency to H.H. The Maharajah of Morvi. The chassis is fitted with a tulip side-entrance body, hood and double glass screen.

ALLEGED RECKLESS DRIVING.

There was a sequel at Lewes Petty Sessions, on the 23rd ult., to the wrecking of Tollgate Cottage, Beddingham, by a motor-car, on September 24th, when Mr. Cecil Chandless was called upon to answer a summons for recklessly driving a motor-car on that day, having regard to all the circumstances of the case. Mr. Staplee Firth appeared to defend, and a plea of not guilty was entered. Mr. Lawson Lewis prosecuted. Mrs. Balcombe, the tenant of the cottage, said she saw the car turning as though going towards the gate, and then as though it was attempting to regain the road. The car collided with the cottage. An old church pew, rather heavy, stood in front; this and a table were broken up. Some part went indoors, and the rest was strewn about. The hedge was very high, and caused the gate to be absolutely invisible. She regarded it as an accident. After further hearing, the chairman said the Bench were of the unanimous opinion that the evidence supported the information, and that the defendant had committed an offence under Section 1 of the Act, and accordingly convicted him, imposing a penalty of £10 and 15s. costs. Notice of appeal was given.

A motor-car accident which happened in Pampisford Road, South Croydon, on September 25th, and which resulted in the death of a schoolboy cyclist, has been inquired into by the Croydon magistrates, when C. C. Hinks, of Lynton Road, West Croydon, appeared to summonses charging him with recklessly driving a motor-car, and in a manner dangerous to the public. It appeared that the boy was cycling on the afternoon of September 25th, when he came into collision with a motor-car owned by Mr. W. G. Fenn, of Croydon, and driven by the defendant, who had been at the time of the accident a week in Mr. Fenn's service. The evidence was to the effect that the driver of the car, who said he was going at ten, eleven, or twelve miles an hour, saw the boy two or three hundred yards away coming towards him, the road being clear. In the end the magistrates dismissed the summonses.

FINED IN THEIR ABSENCE.

Stanley Williams and Walter Bland, who did not appear, were charged at Preston with driving a motor-car without lights. P.C. Wilson said that about 9.30 on the 7th ult. he saw a couple of cars pass him in Preston Road, Lea. Both were without rear lights, and the first one, in charge of Williams, was towing the second one. He turned on his lamp and whistled, but they kept on. He caught them up at the Plough Inn, Ashton, where both the rear lamps had been re-lighted. A fine of 40s. and costs was imposed. Just as the chairman had announced the Bench's decision the defendants appeared in court, and as they said that the train service from Prestwich, where they came from, was awkward, the Bench decided to have the case reheard. P.C. Wilson repeated his evidence, and the chairman said that the Bench would not alter their decision.

THE UNITED MOTOR INDUSTRIES have been appointed sole British and Colonial agents for the well-known Duburle lubricators.

THE TAR-SPREADING COMPETITION.

THE report of the judges on the competition for the best tar-spreading machine and the best preparation of tar for road purposes is referred to in our Comments. The following summary of the references to the competing appliances will also be of interest:—

AITKEN'S PATENT PNEUMATIC TAR SPRAYER.—The judges consider this to be a well-constructed machine, possessing many important advantages. It is self-contained and can be moved rapidly from one part of the road to the other. It can also cover a considerable superficial area of road in a day's work. By the use of this machine, under the most favourable conditions, the actual cost of laying on one coat of tar in a sufficient quantity may be cut down to almost one-fiftieth of a penny per superficial yard, or with a road six yards wide to approximately £1 per mile. The judges have decided to award the first prize of 100 gs. and the Association's gold medal to this competitor.

EMULSIFIX, LTD.—This machine is of the nature of a special form of water-cart having means for mechanically mixing tar and tar oil with a certain proportion of water, and spraying the road before the mixture has time to separate.

JOHNSTON LASSAILLY PATENT TAR ROAD BINDER.—The work done by this apparatus was good. A heavier coating of tar was put on than in the other cases, and chiefly owing to this the durability of the coating has been greater than any of the other competitors.

TARSPIRA, LTD.—This company entered three machines. The judges have decided to award the 700 gallon Thornycroft Tarspiro Machine the second prize of 50 gs. and the Association's silver medal.

THWAITE ANTI-ROAD DUST SYSTEM.—The judges were impressed by the good working of this machine, which seems to be simple and effective. The first cost of the apparatus is very moderate, but the operating cost is not so low as either Aitken or Tarspiro.

MR. REESON'S PATENT MACHINE, USED BY THE GAS LIGHT AND COKE COMPANY.—For putting on a preparation of tar, but not entered for the tar-spreading machine competition. This apparatus consisted of a tank fitted with gravitation sprinkler and two rotary brushes. At a special test of this machine on the road between Swanley Junction and Farningham, Kent—at the same time as the special tests of the Tarmaciser—it worked satisfactorily and was very favourably commented upon. The heating arrangement consisted of a Wells Light burner, paraffin being the heating agent. The air-pressure for this heater was obtained by means of a hand pump.

PREPARATIONS OF TAR.—The preparations of tar tested were of two classes—those containing very little tar and those in which tar formed the main ingredient.

The 25-h.p. Motor-Van recently supplied to Mr. W. Northrup McMillan, Proprietor of the Juja Farm, Nairobi, British East Africa.

As in most cases the roads take the form of roughly beaten tracks traversed only by native pedestrians and bullock wagons, intersected oftentimes at right angles by rivers and streams which have to be forded, the car has been designed to enable the driver to take water nearly 3 ft. deep, and negotiate the most rutted paths without fear of damaging any portion of the chassis. Extra long springs are supplied, and spray and specially powerful side-operated rim brakes are fitted. Three speeds forward, brake and reverse motion are obtained by the Adams pedal-controlled planetary gear.

In this class were the compounds "Crempoid R," "Crempoid D," "Ermenite," "Hahnite," and "Pulvicide." The results of treating the roads with all these compounds may be dismissed in a short paragraph. Within a very short time after their application, i.e., a week in the case of "Ermenite," a fortnight in the case of the "Crempoids" and "Pulvi-

cide," and a month in the case of "Hahnite," they had practically disappeared. The compounds have not the durability of tar, and the judges do not consider their use as economical. Moreover, complaints have been received to the effect that the dust raised from the sections of the roads treated with some of these materials is injurious to the eyes of those using the roads, and to the frontagers living along their routes.

The preparations containing a large proportion of tar were, on the whole, very satisfactory. Dealing with them in order of merit:—

CLARE'S PATENT TAR COMPO, now known as "Improved Dustroyd (Clare's Patent Tar Compo)." The quantity of the material appears to be one gallon to seven square yards applied in two coats. At the price quoted by the competitor—3½d. gallon d/d. London—and after making allowance for getting the material into position on the road it works out, excluding the cost of spreading for a coating of seven square yards to the gallon, at 57d. per square yard of road surface, or approximately £25 per mile of road six yards wide. From the time of laying until recently it has been uniformly good, and is now in better order than any other portion of the road. The surface is now wearing rapidly, especially in the centre. The judges have decided that the "Ballymenagh" 100 guineas Trophy and the gold medal of the Association for the best preparation of tar for road purposes be awarded to Messrs. Clare and Co., of Liverpool.

THE GAS LIGHT AND COKE COMPANY.—Oil gas tar probably penetrates deeper than anything else, but it does not form so durable a wearing surface, and consequently is not so great a protection to the face of the macadam as a good tar preparation. It would probably be very useful for the purpose of giving the first coat to a road, to be followed by one of coal gas tar or other similar substance.

T. G. MARRIOTT'S "MARBIT".—The third in order of merit of the competing preparations is "Marbit," entered by this competitor, but the condition of the section of the road treated is not quite so good as that of the first two named.

COMPANY NEWS.

AUTOMOBILE CARRIAGE BUILDERS.—£20,000. To take over the business of manufacturers of carriage bodies and other appliances attached to the chassis of motor-cars and motor-omnibuses carried on at 90 and 92, Wandsworth Road, S.W., as Savers and Company, and to adopt an agreement with Messrs. G. H. H. Freeman, G. J. Plevins, and H. J. D. Clark. No initial public issue. First directors: Messrs. G. H. H. Freeman, G. J. Plevins, and H. J. D. Clerk, 90 and 92, Wandsworth Road, S.W.

CASTOLIN REPAIRING COMPANY.—£2,000. To take over the business of engineers and engineering contractors carried on by Messrs. T. W. Sheffield and W. H. Lilienfeld, as the Castolin Repairing Company. No initial public issue. First directors: Messrs. T. W. Sheffield and W. H. Lilienfeld. Remuneration as fixed by company. 11, Queen Victoria Street, E.C.

J. E. H. MONYPENNY AND CO.—To adopt two agreements with Mr. J. E. H. Monypenny and to carry on the business of manufacturers of motors, carriages, &c. No initial public issue. First directors: Messrs. J. E. H. Monypenny, H. Bacon, and W. H. Hodgson. 17, Hanover Square, W.

DAIMLER MOTOR.—The report for the year ended September 30th states that the conversion of the original preference shares into ordinary shares has been completed, and of the 100,000 new 6 per cent. cumulative preference shares authorised to be issued by the shareholders 73,300 have been allotted. The profit for the year, after provision has been made for interest on debenture stock, depreciations, bad and doubtful debts, and all charges, amounts to £124,213; bonuses due to employees on above profits are £13,805; and, after adding balance of last year's profits (£34,611) and deducting £634, dividend on 73,300 six per cent. preference shares, there remains a disposable balance of £144,395. The directors propose: Special fund for renewal of plant and machinery and for experimental and development work, £20,000; dividend of 12½ per cent. on 200,000 ordinary shares, £25,000; bonus of 2s. per share on 200,000 ordinary shares, £20,000; general reserve account, £30,000; balance carried forward, £49,395. The above dividend and bonus are equal to a return of 22½ per cent. on the ordinary shares. The business of the company shows a substantial increase over previous years, though, owing to the reduction in prices, announced at the last annual general meeting, and the increased value of the cars supplied, the profit has been materially lessened.

HUMBER, LIMITED.—For the year ended August 31st last, after making due allowance for bad and doubtful debts, depreciation, and managing director's commission, there is a net profit of £154,434, making, together with £9,430 brought forward, an available balance of £163,865. The directors recommend that this amount be appropriated as follows: Dividend of 6 per cent. per annum on the preference shares for the year ended August 31st, 1907, £15,000; dividend of 20 per cent. on the ordinary shares, £50,000; provident fund (including workmen's compensation in cases of accident), £5,000; general reserve fund, £85,000; balance to carry forward, £8,865. The sales of the company's productions show a further large increase, and the profits realised in all departments have been satisfactory. The erection of the new works at Coventry has been energetically proceeded with. The buildings are now nearing completion and will, it is hoped, be fully occupied before the pressure of work is felt next season. The outlook

for next season's trade is thoroughly satisfactory. After mature consideration, the directors have decided that, instead of meeting the whole of the outlay out of profits, as originally intended, it is advisable that a portion of the expenditure be met by the issue of further capital in the form of an addition to the ordinary shares. They recommend that 100,000 further shares, ranking *pari passu* with the present ordinary shares, be created, and they propose, in the first instance, to offer these to the holders of the existing ordinary shares.

ROVER.—The report of the directors to August 31st states that the balance-sheet shows £29,782 as available net profit, of which £16,870 has been earned during the year, after payments and reserve for depreciation, debenture interest, directors' fees, expenses re new capital, and removal to new works, &c., amounting to £8,153. Full reserves have been made for bad and doubtful debts: £30,000 has been written off the amount appearing in last year's balance-sheet for goodwill, leaving this at £15,000 only. It is proposed to deal with the available profits by paying a dividend of 10 per cent., less tax (£9,727), and carrying forward to next year £20,054. The past season is stated to have been a satisfactory one. The prospects for next year's trade are encouraging. The increase in the company's business necessitates, in the opinion of the directors, a further increase in the share capital of £50,000.

A LINCOLN GARAGE.

MOTORISTS are well alive to the attractions of Lincoln. The centre of a district of good roads and the home of a sane and sympathetic police, it is also full of interest to the visitor. Crowned by its superb Cathedral there is no town fuller of archaeological interest, whilst Roman remains confront him on every hand. One of the most notable structures is the Stonebow, a venerable obstruction in the very heart of the city. A few yards away, turning down Guildhall to Newland, the motorist will find

all his needs catered for at the splendid garage of Messrs. R. M. Wright and Company, who are one of the motor pioneers of the country.

The entrance to the garage is situated near the showrooms at the four cross roads—Guildhall Street, Newland, Mint Street and Water Lane. The lower floor is constructed in two bays, both measuring some 100 ft. long and 100 ft. wide. At the far end is situated a long, well-constructed inspection pit. Coming back towards the offices is an excellent washing place. The general repair and machine shop is situated on the first floor, a lift being ready to take the cars right away. There is a good range of modern machine tools and a staff of motor-engineers whose knowledge of the various different cars is particularly extensive. Vulcanizing plant for all tyre repairs is also provided. The stores are replete with oils, grease, petrol, and tyres. The heating arrangements are well carried out. A garage ticket is given for every car entering, so that a correct record can be kept stating the time every car arrives. This is a good method of organisation and makes things easy of control and direction, which characterizes such an establishment.

The showrooms are made interesting by a display of such cars as Napiers, Daimlers, Humbers, Argylls, Belsize, De Dions, and other types of vehicles. The department of cars for hire plays a very important part with the firm, as a number of vehicles are kept for this purpose, including landaulets, limousines, and open touring cars, and 50,000 miles is an average year's running for these cars.

Mr. R. M. Wright, as principal, is well known in the trade and drove the first 10-12 h.p. Coventry Humber car officially observed 5,000 miles in five weeks to prove its reliability.

THE CAR SUPPLY COMPANY, of 34, Knightsbridge, W., inform us that as sole agents for the well-known French car, the Duhannot, they hold stocks of spare parts in London for users of these vehicles.

FORTHCOMING EVENTS.

NOVEMBER.

- 3rd.—*L'Auto's* Concours de Pannes.
 6th (F.).—Society of Motor Manufacturers and Traders' Dinner, Grand Hotel, Charing Cross. Mr. E. Manville in the chair.
 11th-23rd.—Olympia Motor-Car Exhibition.
 12th-30th.—Paris Motor Show.
 13th (W.).—Annual Dinner of the Motor Union at the Hotel Great Central, London.
 20th (W.).—Institute of Automobile Engineers. Address by Col. R. E. Crompton.
 22nd-30th.—Stanley Show.
 30th (S.).—Annual dinner of the North London A.C. at the Midland Grand Hotel, London.

DECEMBER.

- 2nd (M.).—Cheshire A.C. annual dinner.
 4th (W.).—Southend and District M.C. annual dinner.
 5th (Th.).—Exhibition at Berlin.
 7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.
 18th (M.).—General Committee of the Motor Union.
 21st (S.).—Opening of the Brussels Exhibition.
 26th.—Annual Reliability Trial of the Motor Union of Western India.

MARCH, 1908.

- 21st-28th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

LIGHTING-UP TIMES—LONDON.

Nov. 2nd—5.30	...	4th—5.28	...	6th—5.24	...	8th—5.21
" 3rd—5.29	...	5th—5.26	...	7th—5.23	...	9th—5.20

CLAIM AGAINST MOTORIST.

At the Bloomsbury County Court, on Monday, Judge Bacon heard a claim for £80 by Mr. William Kemp, jobmaster, of Adelaide Road, N.W., for damages for the loss of a horse in consequence of the same coming into collision with a motor-car, the property of Messrs. Sydney Straker and Squire, Ltd., at the junction of Boundary Road and Finchley Road.

The case occupied the court a considerable time. Mr. Merlin (instructed by Mr. T. W. Staplee Firth) appeared for Messrs. Straker and Squire, and the judge dismissed the claim with costs on the ground that the accident was brought about by the negligent manner in which the horses were managed.

ROAD REPORT.

HERTFORDSHIRE.—The County Council has added £3,000 to the estimates of the county surveyor for additional expenditure required for main roads, in consequence of the continued damage by motor-cars, lengths of roads having been stripped of granite which he hoped might have lasted through the winter.

PUBLIC MOTOR SERVICES.

THE Cambrian Railways have a winter motor service between Pwllheli and Nevin for the conveyance of passengers and parcels. The local agents are Messrs. Parry, Nanhoron Arms Hotel, Nevin; J. Jones, Tonyparc Shop, Morfa, Nevin, and J. Jones, Ship Inn, Edeyrn.

MESSRS. TILLING, LTD., are starting a service of motor-buses between Eltham and Woolwich.

POLICE TRAPS.

THE Rainford police are watching a trap on the road to Southport from that village.

TRAPPING is being made a feature of police work in Ewell Road, Ewell.

AT Ruxley Hill, Bromley (Kent), the police have a measured distance.

TRAPS have lately been laid on the Inverness and Nairn road.

THERE is a trap on the road leading from Beverley past the Victoria Barracks.

THE Alnwick police have established a measured distance of 900 yards on the north road between North Charlton Bridge and the lodge at Alnwick.

THERE is another control of 1,100 yards between the South Gate and the Alnwick Cemetery.

WALSALL motorists should beware of the quarter-mile traps which have been set on the Mellish road and also on the Birmingham road.

THE trap at Allesley is in almost daily operation, and a warning recently given in our columns still holds good.

BUSINESS NEWS.

THE ELASTES COMPANY, LTD., announce an important reduction in price in respect to certain sizes of Elastes filling, particulars of which will be sent to any one interested. Considerable improvement has been effected in the Elastes moveable rim, which, together with the company's specialities, will be on view at the Olympia Show.

MR. C. F. POUCHER, M.I.A.E., informs us that he is resigning his position as works manager and designer to the Enfield Auto-car Company, Ltd., Redditch, and is desirous to take up similar duties with a good firm or meet with financial assistance to commence business on his own account.

ARIES MOTORS, LTD., is the title of a new concern which has just been formed with a capital of £10,000 for the sale of Aries cars in England. The managing director of the new concern is Mr. R. L. Philpot, who until recently was sale manager of the Wolseley Tool and Motor Car Company. The new company is establishing a depot at 4, Princes Street, Hanover Square, London, W.

THE NATIONAL MOTOR ACADEMY will have a car in attendance at Olympia for the convenience of anyone wishing to inspect their premises and to avail themselves of their services.

MR. C. MCADAMS informs us that he has taken over the business lately carried on by the William Truscott Motor Repository, Nelson and Rupert Streets, Bristol. Mr. McAdams has been in the trade since its beginning, and has businesses at Stockton and West Hartlepool. We understand the auction sales will be discontinued.

THE E. M. BOWDEN'S PATENTS SYNDICATE, LTD., will have some specimens of front wheel brakes included in their exhibits at the approaching shows, and they will be prepared to go thoroughly into the subject there with anyone who requires further information.

THE BRITISH PETROLEUM COMPANY have reduced the price of "Shell" motor spirit and "660" motor spirit by a penny per gallon.

M. L. BLERIOT, of 14-16, Rue Duret, Paris, has been appointed sole concessionaire for the G.L. Carburettor Controller and Petrol Economiser in France.

THE Osterfield Motor Car Syndicate has been registered with offices at 55, Park Walk, Chelsea, S.W.

SOME time since a private car owner asked a firm of car manufacturers to fit Elastes-shod wheels to his new car, about to be delivered. The makers objected. The motorist reported this to the Elastes Company, who wrote the car manufacturers, asking if this remark was made from want of confidence in their cars, or from ignorance of Elastes. The car company replied that they "were under the impression that certain effects were produced by the use of Elastes," but were making experiments and would communicate further. A later letter says that they "have now gone fully into the matter of Elastes tyres, and have written withdrawing the objection to fitting these; we see we were somewhat wrong in our opinion of same."

WE are informed that Messrs. Aster, Ltd., are now in liquidation, having sold their name and goodwill to the Aster Engineering Company, Ltd. The latter concern have increased their capital £70,000 by a private issue, the capital now being £120,000. The whole of the business will be conducted from 4, Princes Street, Hanover Square, W. The works, which are at Wembley, Middlesex, are fully equipped for carrying out a large business in the construction of engines, gear cutting, and the manufacture of carburettors, pumps and magnetos, &c.

THE Anglo-American Oil Company, Ltd., inform us that they have made a further reduction of 1d. per gallon in the price of their Pratt's Motor Spirit.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relative to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, NOVEMBER 9, 1907.

[No. 453.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

ELSEWHERE we publish the two letters which conclude the correspondence that has lately taken place between the Motor Union and the Automobile Association, and which mark the close of a controversy that excited considerable attention some weeks ago. In these letters between Mr. C. D. Rose, M.P., and Colonel W. J. Bosworth are suggestions which, if loyally carried out by both organisations—and which no doubt they will be—will secure a restoration of that cordial feeling

which should animate the various associations for the general welfare of the motor movement. It has been agreed that the Motor Union badge is to be modified to prevent any possibility of confusion with that of the Automobile Association. The withdrawal of the road scheme of the M.U. will leave all matters appertaining to the patrolling of the roads as the special province of the A.A. On the other hand, the latter organisation will recognise the sphere of the Motor Union work in such matters as appertain to the dust nuisance and the general question of the improvement of roads as well as the subjects of insurance and legislative and general legal work. Thus, we trust, ends a dispute which at one time loomed large in the eyes of the public, but which, owing to the tactful guidance of Colonel Bosworth and Mr. Rose, has been reduced to an amicable settlement. There is plenty of room in both organisations to develop policies of real value to motorists without in any way overlapping the activities of each other.

Patrol Precautions.

As far back in the year as August 10th and 17th we drew attention to the activity of the Public Control Department of the London County Council in warning Borough Councils of the Metropolis as to the risks that were caused by the discharge of petrol into sewers. This, as we showed at the time, had become an increasing source of anxiety to those responsible for the safety of the men who are engaged in the necessary service in connection with sanitary work. Now the matter has gone further, and at the last meeting of the London County Council a report from the Department was presented which officially recognises the excellent plans that had been suggested for the mitigation of the danger. All licensees under the Petroleum Acts whose use of petrol may in any way lead to the offence have been served with a copy of the Council's order forbidding the discharge of the spirit into the drains. A prohibitive condition is also inserted in licences granted in

such cases; and warning notices, printed in three languages, for exhibition in garages, both public and private, are being widely distributed. Various drainage interceptors designed to retain petrol have been examined, and it has been decided that one which has been in satisfactory use for some years at a large petrol distillery would answer the purpose. They accordingly had drawings of this interceptor prepared for the information of persons concerned, and are now obtaining the provision of such interceptors at various licensed premises in the county. In cases of applications for new licences where it is evident that the use to which the spirit will be put will involve serious risk of discharges of spirit into the drains, the provision of an interceptor is required before the licence is granted. As a result of these efforts nearly fifty of these devices have now been constructed on premises in the area of the London County Council. It is impossible for the licensing authority to entirely prevent all discharges of petrol into the sewers, as large quantities of spirit are kept without licence at private motor-car garages, and much is used for dry cleaning in private houses, but the danger will be largely diminished by the provision of interceptors on those licensed premises where there is a likelihood of petrol escaping into the sewers.

Cars v. Railway.

TALK of the railway dispute is again bringing the motor-car to the front as a public service vehicle, and the suggestion of a correspondent for a kind of mobilisation of private motor-cars to assist the public in getting to and from business in the event of a strike occurring on the railroad is interesting. Whether private owners would consent to the proposal is a matter of considerable dubiety, which questions of licensing would probably settle in the negative. There is no doubt that in many districts local livery stable keepers and similar firms might organise such a service with fair promise of success, but no haphazard method would stand any chance of sound financial consideration. At the same time the discontinuance of a regular train service might give enterprising motorists an opportunity of establishing short services across country in many places. But too much need not be expected for the motor industry from the misfortunes of the railway companies.

The Commercial Vehicle Trials Awards.

ALTHOUGH the judges in the Commercial Vehicle Trials of the Royal A.C. are still busily engaged in connection with their report, the publication of the same will not take place for two or three weeks. This delay is occasioned by the many elaborate calculations which have to be checked and con-

sidered. Meanwhile, however, the awards have been made known with commendable promptitude, and we would congratulate the winners of the gold and silver medals upon their successes. A full list of these is given on another page, from which it will also be seen that the drivers have been recognised in a way that should become a regular feature of such contests.

A New Road in Devon.

◆ ◆ ◆
In our Correspondence columns this week, Mr. R. B. Jeune revives interest in the making of the new road which has been proposed between Lynton and Lynmouth. The Rural District Council have now undertaken to be responsible for the work provided there is sufficient financial support from the locality to warrant the enterprise. Those who have enjoyed the pleasures of motoring in Devon will doubtless contribute their quota to the expense, and so provide a means of avoiding some of the hills that try the cars of small power.

Owing to the recent heavy rains the main road between Worcester and Hereford was impassable for three days. The photo reproduced above depicts Mr. F. W. Barker, of Barker's Garage, Worcester, on his 20-28 h.p. Darracq, at Bransford, making an attempt—which was not successful—to get through. Mr. Barker took the precaution to reverse into the water, so that, should it become too deep, he could get away before it reached the contact maker.

The Speedometer.

◆ ◆ ◆
AMONG the accessories that will form an important section of next week's Motor Show at Olympia, speedometers will have a conspicuous place. These have come to possess a legal as well as a mechanical value, and in the provinces as well as the metropolis the possession of such an instrument has been a means of economy to many motorists. In a case heard recently at the Marylebone Police Court, the magistrate, after saying that if the defendant had had on his car a speedometer which registered and retained the indication of the maximum speed, the case would have been dismissed, went on to observe to the solicitor:—"I don't know if you are aware of it, but we have many of these motor cases. And inasmuch as it is proved that there is such a thing as a speedometer which indicates the maximum speed at which the car has been travelling and retains it, it seems to me motorists in future will have no justification for being found on a car without one."

The hint is obvious to those likely to appear before that particular Bench.

Motor Cycling.

◆ ◆ ◆
RENEWED activity on the part of the motoring organisations should draw within their ranks many motor-cyclists who have previously held aloof from association with their fellows. Such will be to the advantage of the whole movement, for in the ranks of owners of motor-cycles are many prospective purchasers of cars. And the education of the public can be better done by collective work than by isolated endeavour. In many ways the interests of the two sections are identical; and the woes of one are equally the worries of the other—especially in the presence of such men as Policemen Jarrett, Waghorn and Marks, an illustrious trio whose names are familiar wherever the motor moves. At the present moment the Motor Union and the Automobile Association are urging upon motor-cyclists the desirability of extending their influence in organised bodies, and we would add a hope that those who drive on two wheels will no longer decline the advantages of union.

Tarred Roads and Night Riding.

◆ ◆ ◆
THOSE who were in Ireland at the time of the Gordon Bennett races in that country will remember how the donkeys had a habit of resting on the highways at night time, and how when a dust-laying preparation was used on the roads much confusion was caused to night riders. The fact has been revived in our memory by the suggestion from a lover of night driving that the tarring of roads is proving inimical to the enjoyment of such a pursuit. In fine weather, when the country roads are dry, they present a whitish appearance at night, and driving is a pleasure. But when this is changed to a dark, practically black, surface by the application of tar or other preparation the effect is very disconcerting to the driver of a car. Objects of obstruction which may be on the road are not easily seen, especially should the light from the lamp not be of the best. As soon as such a stretch is reached speed should be reduced, otherwise it will often be difficult to find the distinguishing line between the road and the footway, or between the latter and the hedge—or worse.

The Pedestrian must be careful.

◆ ◆ ◆
IN summing up a case at the Manchester assizes, Mr. Justice Pickford has shown an appreciation of the position of the pedestrian and motorist respectively that is worth noting as an instance of the progress of judicial education. A gentleman had claimed damages for having been run into by a motor brougham while attempting to cross the roadway. The judge pointed out in his summing up, that whilst those who drove motor-cars must exercise caution, those who used the roadway were also under some obligation to take care of themselves. Automobiles have become such common objects in traffic that people crossing the highways ought to be on the look-out. This is a rational view of the position that is being assumed by most of the judges and magistrates before whom such cases are heard, and indicates an opinion that will before long, we hope, be universal on the Bench. When will it reach some of the southern courts?

Municipal Motor Instruction.

◆ ◆ ◆
LAST year the Municipal Technical School at Portadown, Ireland, ran a short course of instruction in the mechanism of motor-cars, and these lessons were so well attended that the Principal, Mr. G. H. Woollatt, felt justified in extending the work to some extent. The object is not to teach driving, and they do not intend competing with any of the established driving schools. What they do intend doing is interesting the public in motor traction, and explaining the

principles involved, so that those who would care to do so may know what points to look for in cars. They have a large number of mechanics attending the classes, and these men are already familiar with practical mechanical methods, and only need a training in the direction of familiarising with the special methods of dealing with well-known mechanical principles and devices when these are applied to a light and quickly-moving vehicle. Other students—a separate class—are drivers, owners, and prospective drivers and owners. These, as a rule, require much more training, and do not wish so much theoretical work. "Comparative anatomy of cars" or "motor vehicles," would aptly describe their course of instruction, which consists mainly of six popular lectures, students being drafted from this to the shop work upon application. This is regarded as the elementary class, and from it students are selected to go through a full course of motor design and construction. It is simply the beginning of what may become an important department, when a few years' work has been put in. Those responsible for the classes are always anxious to have any new devices or methods

proceedings in those cases where motor-cars are driven to the public danger. But they did not see their way to go further than this, being convinced that the enforcement of the law as to driving to the danger of the public was more likely to insure the safety of those who use the roads than was the restriction of the speed of motor-cars in certain places. The East Riding County Council is to be congratulated upon the view it takes with regard to the automobile problem, for, in addition to being strong enough to resist a widespread petition from councils in its area it has also put up 150 warning signals indicating to motorists where particular care should be taken on the public highway.

Inland Revenue Methods.

visitors from Ireland.

JUST as we go to press we have received from the secretary of the Irish A.C. an interesting letter with regard to the way in which the Scottish Inland Revenue authorities use their powers of inflicting "pains and penalties" on The case is almost identical with that of

The Evreux Speed Trials.—A General View of the Starting Point.

communicated by firms, such matter being immediately placed before the students. Sketches and drawings should be accompanied by permission to convert the same into lantern slides.

A Sensible County Council.

WE are glad to see that all county authorities are not inclined to accept suggestions made by local bodies within their areas with regard to the limitation of motor-car speed to ten miles an hour or less. Recently the local councils of

Bridlington and Burton Agnes asked the East Riding County Council to apply to the Local Government Board for the restriction of speed through all the villages in the East Riding to seven miles an hour. The Hornsea Council also favoured a restriction within their boundary. The matter was considered by the Highways and Bridges Committee and also by the Standing Joint Committee, which agreed in asking the Chief Constable to take

a French visitor to the south of England that we mentioned some time ago. Irish residents are happy in the fact that several impositions with which we are familiar in this country are not levied in their island. But when one of the members of the Irish Automobile Club recently went to Scotland for a few days' shooting, taking his motor-car with him, he received a communication from the authorities claiming penalties amounting to £45. These were ultimately settled by a payment of £9. Such instances will debar many sportsmen from the Emerald Isle bringing their cars to this country, and surely an arrangement could be effected securing freedom from these imposts to those who bring their cars to Britain for a few days only.

THE "County" is the name given to a new car which is being built by the Halifax Motor-Car Company, of Weymouth Street, Halifax, and designed by Mr. Edgar Smith.

MOTOR TOURING IN CANADA.

CANADA has millions of miles of territory which not even her own people know. The provinces are full of interest, for their abundant natural resources, their scenery, and their people. To the motorist Canada offers special charms. The country has good roads, hotels, garages, and is, in short, an ideal field in many respects for touring. Ontario is particularly well fitted for motoring. The conditions in this province are most favourable, the roads being, on the whole, very good, mostly well-cared-for macadam, and in many places as smooth as the roads in France. Of course there are exceptions, as in all countries. The scenery, also, is attractive, resembling very much that in the New England States.

Some favourite runs for tourists in Ontario are between Niagara Falls and Detroit, Niagara Falls to Hamilton and Toronto, Detroit to Hamilton, Toronto to Montreal and Toronto to Lake Simcoe. The Niagara Peninsula, through which the run from the Falls to Hamilton extends, affords delightful touring. This section is the "Garden of Canada," and one of the oldest settled in the Dominion. With either Hamilton or Toronto as centres, many delightful runs may be made to different parts of the province. Western Ontario is a

the old town of St. Levis on the cliff, by the left-hand route. At Scott's Junction, half-way between Quebec and Baucerville, there is a quaint inn, and at Baucerville is a hotel where one can obtain good native food, fish, venison and mutton. Leaving Baucerville, the route is down the Chaudiere Valley to Jersey Mills. Here turn sharp to the left and climb straight up to the cathedral at St. Clume, twenty miles away. Thence over the mountains by devious turns to the Line House, some ten miles from St. Clume. Descending the Line Hill pass over the line into the States.

With regard to touring in the rest of Canada, the Land of Evangeline, Nova Scotia, is probably the most favourite resort. The roads in this province, one of the oldest in the country, are very good, and the scenery is attractive for its historical associations. The number of motor-cars in Nova Scotia is somewhat limited. A little touring is done in New Brunswick, where there is a very active organisation of enthusiasts, with headquarters in St. John, N.B. If one wants to tour in the Golden West, perhaps the most interesting part of Canada at the present time, owing to the vast developments now going on, it is economical to ship the car and start it running just whenever the scenery and the roads become sufficiently inviting. With an average dry summer anywhere in Western

A Typical Country Road in Canada.

rich dairying district, and the people are progressive and prosperous. Up north are the famous Muskoka Lakes and the Georgian Bay summer outing ground, where the scenery is extremely picturesque. North also are the Cobalt Mines. Along the north shore of Lake Ontario, from Toronto to Brockville, the old Kingston Road makes a splendid run, but it is advisable to follow this only as far as Montreal. Between this city and Brockville it is better to take the boat down through the Thousand Islands from Kingston to Brockville, which, by the way, is a pleasant diversion. Some tourists find their way from the United States into Canada by way of Ogdensburg, across the St. Lawrence River to Prescott by ferry. Thence there is a good run to Ottawa, the capital city of the Dominion, or to Toronto and Buffalo.

Touring in Quebec is much more strenuous than in Ontario. The novel character of the country and its inhabitants will make up in interest for the difficulties encountered on the roads, which in many places are somewhat hard to negotiate, but not impassable, and over many sections quite good. Quebec City is well worth a pilgrimage in a motor-car. This quaint old city, so different from all others in America, is a good place to spend a week's holiday, and there are numerous charming runs from it.

The distance from Montreal to Quebec is about 200 miles. Crossing the St. Lawrence by ferry from Quebec one can go to

Canada, the roads are splendid, just natural trails glazed hard and level. Many of the northerly reaches are hilly. Southward the country is gently rolling. In many respects the prairie land has advantages for the motorist not offered by the older provinces. For great inspiring distances, coupled with the best of air and the finest of natural roads, no land is kinder to the motorist than Western Canada.

Certain customs formalities must be attended to in entering Canada. The law requires a deposit of £5 and bond for double the estimated duties, guaranteeing re-exportation of the car within three months. The deposit will be returned when the car is taken out of the country. The motor-vehicle law in Ontario is, remarks Mr. E. M. Wilcox in the *New York Motor*, moderately stringent, the speed limit in the country being fifteen miles an hour, and in towns and cities ten miles an hour. Of late, owing to a number of complaints, the provincial constables have been busy in enforcing the provisions of the law. What might be called police traps have been in operation in certain sections. As a pointer to motorists who contemplate touring in Canada it would be well for them to write the secretary of the Ontario Motor League to secure the necessary guide-books and maps. There is only one official automobile road guide-book published, that being under the auspices of this organisation.

A NEW SHOCK ABSORBER.

THE fitting of anti-shock mechanism in addition to the usual springs of motor-cars has received much attention in recent years, many attempts having been made to provide a perfect damper in order that the maximum of comfort may be obtained. The use of a damper greatly improves the action of the carriage springs, in that whilst the springs absorb vibration to a large degree the shock absorber resists that recoil action which so greatly interferes with the comfort of passengers. Although the new apparatus illustrated herewith, and

Fig. 1.—View of Shock Absorber as fitted to rear axle of a chain-driven car.

lately introduced by the Wolseley Tool and Motor Car Co., Ltd., has been designed to fully meet these difficulties, it has the additional merit of being perfectly simple in its construction. In action it automatically absorbs the recoil action of the carriage springs and makes it possible to drive with comfort over the roughest roads.

The apparatus consists, as will be seen from the illustrations (Figs. 1 and 2), of a small circular box mounted on the frame of the car above either the front or rear axle. Inside the box is the shock damping mechanism, which is connected to the main axle by suitable levers and motion rods, these being adjusted so that any movement of the carriage springs operates the damper. The action of the mechanism in the box is in principle restricted by its movement through grease, with which the box is filled. This movement is controlled by specially-designed

Fig. 2.—Device as fitted to live axle vehicles.

valves and by-passes which regulate the return of the damper to its normal position after the springs have been depressed. It consists of two vanes which are attached by two levers to the car axle. The action is such that any motion of the vanes displaces the grease, and while this is done quite easily at slow speeds the resistance increases rapidly as the movement is quickened. The arrangement whereby increased freedom of action is obtained while the road springs are under compression is effected as follows:—The two vanes are fitted with valves, which in one direction allow the grease to pass through to the other side of the vane; the recoil action of the spring,

however, closes these valves, the grease only resuming its previous position through a by-pass, the size of which is determined in accordance with the weight of the car. A gland joint is provided in the outer cover of the damper box where the operating lever passes through, and there is also a filling hole for grease. To ensure efficient working it is only necessary to see that the grease is of proper consistency, and that the box is quite full and free from air bubbles.

We understand that the device has been given long and careful tests before being placed on the market, and that its efficiency has been proved under the most trying conditions. It is, of course, adapted to the Siddeley cars, but is also so made that it can be fitted to practically any motor vehicle, special brackets being made to enable this to be done.

THE COLTMAN 20-H.P. CAR.

WE are able this week to give a general view of the new 20-h.p. car which has just been introduced by Messrs. H. Coltman and Sons, of the Midland Ironworks, Loughborough, an old-established firm of engineers. The vehicle, which has been built to the designs, and under the supervision of Mr. Wm. Wilson, is fitted with a 20-h.p. four-cylinder engine, in which a number of special features are incorporated, notably in regard to the ease of accessibility of the valves and the cam shaft, and also the dual ignition, which

is effected through one switch and a single set of plugs. The cylinders, which are cast in pairs, are 4 in. bore by 4½ in. stroke. The speed of the engine is controlled by means of two levers mounted above, but not turning with, the steering wheel. A novel and simple switch is fixed on the dashboard within easy reach of the driver, designed so that by a sliding movement the ignition current can be either taken from the accumulator or the magneto. Special attention has been given to the wiring to simplify inspection or renewals. The clutch is of the metal-to-metal type, of new design, having very large wearing surface and mounted on ball bearings; it is so arranged that it can be taken out complete by simply withdrawing two pins. The gate-controlled change-speed gear gives four speeds forward and a reverse, with direct drive on the top; the controlling bars are positively locked in each position. The reverse pinion only rotates when the backward motion is being used. The shafts are extra large in diameter and very short in length, and are fitted both with ball thrust bearings and ball journal bearings. The transmission is through a cardan shaft to a live axle, the latter being so arranged that the large bevel wheel and the differential can readily be taken out without removing the road wheels. The axle is enclosed in a special steel casing from end to end. We understand that one of the new vehicles will be available for trial runs during the next fortnight at the Olympia Motor Garage, Addison Road Bridge, Kensington.

CONTINENTAL NOTES.

Speed Trials at Evreux.

An interesting series of speed trials was held near Evreux, France, on Sunday last, under the auspices of "Les Sports," and for which no less than 104 entries were received. The morning was devoted to the tests over the flying kilometre on the level, the competitors having a downhill run of nearly a kilometre ere passing the first time-keeper. The contest was open to all classes of racing and touring cars and cycles. In the single-cylinder class—cylinder bore up to 100 mm.—Sizaire, on a Sizaire-Naudin, put up the excellent time of 47 2-5 sec., beating many of the higher-power cars. The record of the day in the touring class was made by Molon on a Gladiator in 31 2-5 sec., and in the racing section by Rigal, on a Darracq, in 27 3-5 sec. The first two in each category qualified for the afternoon's event, which consisted in a race over the same course, but in the reverse direction, which gave 900 metres

two series of an hour each, one for deep ploughing, of a depth of from 12 to 14 inches, and one for light ploughing, from 4½ to 6½ in. In making the awards the jury will take into consideration the area of land ploughed during the time allowed, the depth and regularity of the work and the facility of turning of the competing machines. The second section of the trials will be devoted to haulage tests and also to experiments in utilising the tractors as prime movers for fixed agricultural machines. As we go to press we learn that it has been decided to postpone the trials until May next.

The Veterans of the French Industry.

An interesting list has been prepared by the Chairman of the Organising Committee of the Paris Salon of the French motor-car builders who have exhibited at each of the annual shows so far held. They are only ten in number, and, as they may be termed the veterans of the industry, we append their names:—De Dion-Bouton, Panhard and Levassor, Mors, Peugeot,

The Fleet of Motor Wagons employed in the recent French Military Manœuvres near Bordeaux.

[La France Automobile.]

on the level and 700 metres up hill. The times were taken over the standing mile and also the flying kilometre, the awards being, however, based on the former. Interest in the proceedings was increased by sending the competitors off in pairs, so that while really a speed trial, the spectators were treated to several keenly contested races. The single-cylinder car class (up to 100 mm.) again showed the speedy qualities of the Sizaire-Naudin, the one driven by Leboucq covering the mile in 1 min. 47 3-5 sec. The fastest touring car time was that set up by Guyot on a Minerva, 1 min. 37 1-5 sec., while the Coupe d'Evreux was carried off by Rigal, who covered the mile on his Darracq racer in 1 min. 9 2-5 sec.

The Trial of Agricultural Motors.

November 10th has been fixed as the date of the trials of agricultural motors which are to be held by the "Auto" in the neighbourhood of Paris. It has been decided that the competition will be open for (1) self-moving ploughs, (2) tractors for hauling agricultural machines, and (3) automobile winches for hauling machines by cables. The first tests will be divided into

De Dietrich, Delahaye, Krieger, Decauville, Rochet-Schneider, and La Compagnie Française des Voitures Electromobiles.

Miscellaneous Items.

A company is reported to be in course of formation in Moscow to build motor lorries.—The "Auto" has postponed its Concours de Pannes until December 8th.—It is proposed to hold a reliability trial of light cars in the Turin district early next year.—Negotiations are reported to be in hand in connection with the establishment of a Renard road train service between Ceret and Figueras, Spain.—The Post Office authorities in Nuremberg are adopting motor-vehicles for the transport of the mails between the various post-offices in the city and suburbs. Twelve vans are reported to have already been ordered.—A proposal to establish a motor-car service between Trieste and Abbazia, Austria, is under consideration.—Messrs. Laurin and Klement, of Jungbunzlau, Austria, are introducing a 45-h.p. eight-cylinder car.—Arrangements are in hand for the establishment of a public motor-car service between Marienbad and Königswart, Austria.

THE COMPLETE CHAUFFEUR.

IT must be fairly obvious to the most casual student of the evolution of species that the genus chauffeur is progressing. It is indeed of the highest importance that he should march with the times, that he should, steadily and surely, keep step as it were with the improvement of the machines which have brought his calling into existence, and with the requirements which it behoves him to fulfil. Just what these requirements are it is the object of this article to specify and analyse, that is in so far as they apply to those who aspire, for instance, to the wheel of a modern and fairly powerful touring car. We believe we are quite justified in taking this as the type of the ideal and complete chauffeur, although there are, of course, those who will cavil at the definition—those, for example, whose economical tendencies demand a *multum in parvo*, a sort of nondescript servant of the driver-to-fill-up-his-odd-time variety. It is also beyond our province, too, to deal just now with the special qualifications of the motor-omnibus driver.

In the early days of motoring the most bitter and to a great extent justifiable complaints were laid to the charge of the then existent chauffeurs. Swelled head, ignorance, slovenliness, unpunctuality, and want of manners generally, were rife. The

the proper method of laying a table, grafting rose trees, or the correct periods for infant nourishment.

ABSENCE OF PHYSICAL DEFECTS.—Undoubtedly this is a matter of the gravest importance; indeed, we do not think that it can be too strongly insisted on, and even go so far as to say that no chauffeur should be engaged who cannot pass a strict medical examination on certain vital points. For instance, what awful possibilities of danger are presented by epileptics and victims of cardiac disease? Eyesight and hearing should also be tested, whilst the sense of smell, if lacking chronically, constitutes an element of risk. A chauffeur with a clean bill of health and physical soundness is certainly, therefore, only gifted with one of the reasonable qualifications of his calling.

MENTAL POWERS.—There is no doubt that, owing to various causes, a more intelligent class of men now fill the ranks of those employed in driving cars. The efforts of the Royal Automobile Club in the institution of examinations and by the granting of certificates of proficiency have no doubt largely contributed to raise the standard of mental qualifications. The ideal driver must possess a very fair share of intelligence and presence of mind in emergencies. The career of a chauffeur is full to the brim with incidents, and often of such a nature that another hair's-breadth would turn them into accidents. The power

Mr. Walter Callan, the Secretary of the Royal Commission on Congestion in Ireland, on one of the "Brown" Cars used during their investigations.

demand was greater than the supply, and consequently Jack the Chauffeur in many instances thought that he was better than his master. But a Nemesis awaited such individuals, the wheel of supply and demand began to turn, and the inevitable law of the survival of the fittest commenced its purging operations. The very imperfections of the cars themselves yielded a source of nefarious profit and menace, to the temporary advantage of the unscrupulous. But, fortunately, all this is fast becoming past history, and this year the Act dealing with illicit commissions is a further nail in the coffin of the objectionables.

Let us now examine, however, not the imperfections of the time that is gone, but the standard of perfection that we may look for at present. It matters not a jot whether we chronicle in alphabetical order or in sequence of importance the list of qualifications, provided that none are excluded on the one hand or given undue prominence on the other. We will therefore proceed to classify them as follows:—Absence of physical defects, mental powers, manners, moral character, practical mechanical training, practical road experience. A chauffeur who can be classed as A1 under each and all of the headings cited is an unique and perfect specimen of specialised training, and should not be expected to combine these virtues with an insight into

of reasoning, of quickly drawing logical conclusions, are helpful in dilemmas on the road. A chauffeur well grounded in his technical knowledge, and with the necessary practical experience in driving, can tell almost intuitively, as soon as the trouble arises, its exact location and probable cause, and to such a man the remedy is not long in being applied. Patience and thoroughness, energy and resource, will carry a man along and render him invaluable to his employer, and to make himself invaluable is the best thing an employee can do; let him earn the name of being willing and cheerful, let him have the satisfaction of feeling that his master cannot obtain a better servant, instead of doing his work glum and grudgingly when he fancies he is not being well treated.

MANNERS.—There is no earthly reason why a chauffeur should be rude, or even in any degree less polite than any other employee, and yet want of nice manners is one of those failings that is the most frequently complained about, especially by people who are accustomed to the respectful manners of their grooms and other servants. Partly from ignorance, and partly from a foolish desire to show their superiority to other employees, many chauffeurs think it incumbent on their self-respect to adopt an offensive and overbearing tone with their equals, and a very objectionable familiarity with their masters. In neither case are

their efforts of the least avail, and they had much better behave in a manner that will render them on good terms with their fellows on the one hand, and not jar the susceptibilities of their employers on the other.

MORAL CHARACTER.—A feeling of confidence between the owner of a car and his chauffeur can only grow up when the former is satisfied that the moral character of the latter is good. A man may possess very excellent testimonials and obtain easily a situation on the strength of same, but confidence grows or dies as the character is day by day revealed. All chauffeurs cannot perhaps be geniuses, but all can at least have common honesty. All can give their employer a sense of security, a feeling that they can be trusted behind his back. The ideal chauffeur must make punctuality an invariable habit. Not that sort of punctuality that merely enables him to bring his car round to the front door at the appointed time by the skin of his teeth, perhaps by leaving undone some duty that he hopes will escape observation; but methodical, honest punctuality, that is always ready without being flurried; because honest and thorough preparation has been gone through in good time, instead of being scamped because no one may be able to notice the difference. The seeking, or acceptance without seeking, of secret commissions is a most pernicious practice, and the brazen effrontery with which a few unconscientious chauffeurs have practically boycotted respectable firms is nothing short of scandalous. Fortu-

The two Daimler Cars which have been placed at the disposal of the King and Queen of Spain during their visit to this country.

One is of the Milverton limousine landaulet type, with a wheelbase of 10½ ft., and the other is a fixed limousine of the Stoneleigh pattern, with a wheelbase of 10½ ft. Both have seating accommodation for five to seven persons. They are painted in the Royal colours and have the Royal Arms on each door.

nately the practice is likely to be stamped out in the near future, as both the giver and the taker are now liable to punishment if the offence can be brought home to them.

PRACTICAL MECHANICAL TRAINING.—Recent correspondence in a contemporary revealed much diversity of opinion as to the amount of mechanical training that is desirable in a chauffeur. The variance appears to lie in the fact that the writers each looked at the matter from their own narrow and individual standpoint, instead of taking a broad view of the average requirements of motor owners generally. For instance, one writer would aver that any particular knowledge was quite unnecessary because he had succeeded in training some stable lad in a fortnight, quite oblivious of the fact that he was one of those few gentlemen with the time and patience to do such schooling, and that where one might find one such other as he, there would be ninety-nine who have neither time, knowledge, nor inclination to act as tutor, and who would probably never feel contented with such a home-made hybrid article. There is no doubt that a proper mechanical training is of vast importance for a complete chauffeur. The man with a superficial smattering of mechanical training may manage to rub along with good luck, and gradually learn his

experience in the service of that class of employer who professes to find all that he requires in chauffeurs of this type. He thinks he is saving money, and the man knows he is getting a cheap education, and so both parties are happy. Men who have had a good workshop experience are plentiful enough, and many of them do not expect any more in wages than others who could not tell you the difference between a file and a float. Of course some of the various motor schools are doing useful work, but the instruction is necessarily inclined to be rushed through in order to make room for further pupils, and thus the fledgling chauffeurs are pushed out of the nest somewhat early to flutter along the road as best they can.

PRACTICAL ROAD EXPERIENCE.—Although the control of even a large and powerful car is in reality exceedingly easy, it would be the height of folly to imagine that lengthy experience goes for nothing as a factor of safety, and that a green hand, although apparently to a superficial observer as skilful as one of long training, is as much to be trusted on all occasions. Throughout the country the roads are now provided with signs placed as a guide and warning to motorists, and the complete chauffeur should not only know all these thoroughly by heart, but should on all occasions act upon them. They have been placed there for the joint good of the public and motor-car users at considerable expense, and those who habitually ignore them, instead of making a practice of noticing their import, do harm to the automobile movement in general and brand themselves as conspicuous road hogs in particular. Besides which, individual retribution in all probability awaits a large percentage of those, whose selfishness may sooner or later land them in the trouble they so richly merit.

Now that a very large proportion of motorists tour abroad, chauffeurs with a knowledge of one or two foreign languages stand at a great advantage in their chances of good employment. The foreign chauffeur as an employee of British car owners is becoming noticeably rarer, partly on account of the steady increase in the proportion of British-made cars, and partly because foreign drivers are no longer "the fashion." On the other hand, some chauffeurs could take one or two lessons with advantage from their foreign confreres, especially as to adaptability to surroundings. How quickly, for instance, most chauffeurs from the continent get accustomed to our ways and regulations, and make it their business to learn to speak our language as an additional accomplishment, in some cases making it the third or fourth they have learnt with sufficient fluency to at least make their wants clearly understood.

Certainly, therefore, ambitious chauffeurs, instead of pretending to despise "foreign lingo," should make haste to learn, conversationally, at least one, French being the easiest to make a start on, and they should specialise their lessons to the extent of committing to memory a vocabulary of the names of the various parts of motor-cars as well as their accessories.

The chauffeur who would complete his education will be well advised to make himself thoroughly *au fait* with the laws and regulations obtaining on the Continent in all that affects his calling. These vary very considerably in the various countries. For instance, in Austria there is a speed limit of twenty-eight miles per hour in the open country and nine miles per hour in inhabited places. In Germany there is no legal limit for open country, the public danger clause being deemed sufficient protection, and whilst in France there is a limit of eighteen miles per hour, it is absolutely ignored between towns.

The complete chauffeur should also glean all the information he is able about the roads, as to surface and gradients of the principal touring routes, so that he may be in a position to judge beforehand what sort of preparation to make in the way of spares, &c. In short, the man who aspires to be at the top of the tree in this calling, as well as in any other, must be a walking encyclopædia in all that appertains thereto, and must leave no stone unturned that will in any way add to his sphere of usefulness and consequently to his wage-earning value.

A NEW studded rubber non-skid will be shown by the makers of the Samson non-skids at the Olympia Show.

THE Albany Automobile Company have a good display of cars on exhibition at their show-rooms at 106, Albany Street, N.W.

WE learn that by special request Mr. J. B. King has resigned his position as manager of the Trade Information Department of the Society of Motor Manufacturers.

THE 40-h.p. six-cylinder Napier completed its 3,000 miles consumption trial with Simecar benzol as fuel on the 23rd ult. The total amount consumed was 132 galls. 3 pts. 13 ozs., giving an average of 22.649 miles per gallon.

WE learn from the Burlington Carriage Company, Ltd., that a 20-h.p. Delaunay-Belleville car model with a handsome Burlington limousine body has been supplied to H.M. the King of Spain for use during his visit to England.

OWING to a clashing of dates with Messrs. Cordingley's Show at the Agricultural Hall, London, the directors of the Liverpool Cycle and Motor Show have decided to hold the Liverpool show a fortnight earlier, i.e., March 6th to 14th.

MR. WILLIAM VINCENT, of Castle Street, Reading, informs us that he has just concluded an arrangement with Messrs. S. F. Edge, Ltd., whereby he will hold the agency for Napier cars for Reading and a twenty mile radius; this will be in addition to his existing exclusive agencies for Panhard and Mercedes cars.

MR. PHIL RAY, the comedian, after doing his night's turns at the halls, was going home to New Malden in his motor-car, when his car ran into another motor. No serious damage was done to either car or to their occupants, but by a singular coincidence the occupant of the other car was Mr. Will Evans, a fellow-comedian.

A SPECIAL excursion, at very cheap fares, has been arranged to enable those interested to visit the motor exhibition at Paris. It has been promoted, at the suggestion of Mr. H. Hewitt Griffin, by Messrs. Thos. Cook and Sons, and cheap tickets will be issued every Friday during December, and will be available for fourteen days or less.

THE Committee of Management of the American Motor Car Manufacturers' Association has delegated its general manager, Mr. Alfred Reeves, to visit the London and Paris automobile shows, to study foreign conditions, with a view of paving the way for the fifty-one makers in the organisation to reach the foreign markets. The best methods for selling cars, whether through agents or branch houses; the plan of advertising campaign that should be followed, and other details are to be carefully investigated.

NOVEMBER 27th will be the tenth anniversary of the King's first ride in a British automobile. This interesting event took place in the grounds of Buckingham Palace. In compliance with the King's wish, the manager of the Daimler Company drove one of his smartest vehicles to the Palace, and the Prince (as he then was) made a tour of the grounds, taking charge of the steering wheel himself for a short time. It was not until two and a-half years later that the King actually became the owner of the car—a 6-h.p. two-cylinder Daimler. This car did not, however, long remain in his Majesty's service, being acquired by Lord Hastings. A year after its delivery a much larger Daimler of the Lonsdale type was constructed for the King, to be followed by seven other cars manufactured by the same firm.

THE Motor Radiator Manufacturing Company, of 18, High Street, Borough, S.E., have lately introduced a new radiator made in accordance with Dr. Zimmermann's patent. The feature of the new apparatus, which in general appearance is similar to the honeycomb type, is that the cooling surface consists of round tubes which are horizontally inserted at distances of 1 mm. in the radiator frame, and are homogeneously connected with each other and with the frame by metal walls cast in one piece with them. It is claimed for the round tubes that they give the highest obtainable efficiency with regard to the quantity of heat passing from the water into the air, and that they give a maximum of strength with a minimum of weight. Furthermore the construction is such that there is no risk of loss of water by leakage.

HERE AND THERE.

MESSRS. T. G. WYATT AND Co. are well-known motor engineers in Guernsey. Their establishment is at North Clifton and New Street, Guernsey.

THE Daimler Motor Company have been favoured with a repeat order from His Royal Highness the Duke of Connaught for a 35-h.p. 10½ ft. wheelbase chassis.

A SPECIAL stand is being allotted at the Paris *Salon* to the winning cars in the principal motor events in France during the past season, viz., the Grand Prix, Coupe de la Presse, the Coupe de la Commission Sportive, the Concours des Voitures de Petit Tourisme, &c.

THE practicability of repairs to cracked or broken aluminium cases, &c., will again be demonstrated at the forthcoming Stanley show by Mr. R. W. Coan, of 219, Goswell Road, Clerkenwell, E.C., whose special knowledge of this metal is acknowledged by the motor trade generally.

UNDER the name "Auto-Friend" a German firm has recently introduced a device for locking the change-gear lever in the neutral position, so preventing the car being tampered with by curious-minded children or being driven away by unauthorised persons when it is left unattended at any time. As will be seen from the accompanying illustration, the arrangement comprises

a lock, a locking-bar or pin, and a detachable key. The lock is attached to the foot-board of the vehicle, while the pin passes through a hole formed through the sector and change-gear lever. The lock itself is provided with a hinged cover to prevent the ingress of dust or rain. The device is being introduced into England by Messrs. A. Dunhill, Ltd.

To meet the wants of tourists who can afford to study comfort, have not too much time, and yet desire to see the principal beauty spots and most interesting parts of Great Britain and Ireland, the Daimler Company has decided to establish a new department in London, devoted to the hiring out of first-class luxurious types of motor carriage to convey visitors right to the places they desire to see, and so save them the trouble of travelling by a route combining, perhaps, in one journey several railways with corresponding vexatious wearying delays in making connections. It is intended the business shall uphold the present reputation of their well-known cars, and consequently they are selecting for the work vehicles equal in every respect to the best they construct. They will in no way be distinguishable from a private carriage. The driver's livery will be equal to the best; in fact, no pains will be spared in order to render the whole turnout smart and attractive. A branch of the new departure will be an intelligence bureau, where fullest information can be obtained as to the state of the roads, best and most interesting routes and tours, where to stop, cost of shipping, Customs duty, &c.

MR. LIONEL HAINSWORTH is opening a motor garage in Queen Street, Morley.

MR. J. E. SMITH, of Gloucester, has a garage in Southgate Street, coupled with ample facilities for repair work.

LORD G. DUNDAS, of West Hall, Middleton Tyas, and Sir Frederick Cawley, Bart., M.P. for Prestwich, have lately acquired 15-h.p. Coventry Humber cars.

THE Bishop of Bristol has dedicated at St. Augustine's Steps, Bristol, the motor launch Morning Star, which is the latest addition to the fleet of the Missions to Seamen.

At Stand 102 on the ground floor at Olympia the *M.C.J.* will be on sale throughout the Exhibition. Copies of the "Industrial Motor Review" will also be obtainable at the stand.

IN our Legal Intelligence this week we report a case at Falkirk in which the non-quotation of the Continuation Act in connection with a motor-car case secured the dismissal of an action against a motorist.

WITH the title of "An Indian Trip on a Daimler Car," the Daimler Company have just issued an interesting booklet giving an illustrated account of a trip recently made from Umballa to Peshawar on one of their cars.

WEATHER permitting, Mr. J. E. Hutton intends to make an attempt on two world's records on the Brooklands Track, viz., the hundred miles and the hour, on Friday, the 8th inst. At present the one hour record stands at 70 miles 130 yards, while that for 100 miles is at 1 h. 15 min. 40 2-5 sec.

WE illustrate herewith the new non-skid motor-tyre which has lately been put on the market by the Avon India Rubber Company, Ltd., Melksham, Wilts. The hardened steel studs, which are of special design, are securely riveted into a tread of rubber and fabric, the latter vulcanised to the tyre casing under steam pressure. There is a layer of fabric and canvas vulcanised between the base of the studs and the casing, and, as this prevents the studs from injuring the casing, the covers can in most cases be re-treaded when necessary.

THE Gabriel horn is made in four sizes and operates from the exhaust. It is not a whistle or a siren, but takes more the form of an organ pipe divided into three sections and emitting a proper musical chord of three notes. These notes give a deep sound and not in any way a shrill noise. The Gabriel Horn Manufacturing Company, 14, Conduit Street, W., is introducing it here.

THE "Industrial Motor Review" for November will be published, as usual, about the middle of the month, and will contain some experiences of users of motor-vans for delivery work, as well as other interesting articles on the modern motor and its numerous applications to the purposes of commerce.

IN our issue of September 7th we illustrated the new two-seated 8-h.p. single-cylinder vehicle brought out by Messrs. R. Reynold Jackson and Co. With its long bonnet it has a racy appearance, and, having regard to the doings of single-cylinder vehicles in last week's French races, should attract considerable attention. The other day a trio of these cars, painted in Cambridge blue, drew up outside the office of the *M.C.J.* They are fitted with a larger petrol tank than in the original vehicle, and were the first of a number contracted for by the Chelsea Motor Garage, of 85, King's Road, Chelsea, S.W. The proprietors of this well-equipped concern are Messrs. C. A. Macrae and E. Berkeley Ormerod, from whom the new Jackson car can be obtained. In addition to this agency they have also a garage and repair works, the former of which is open night and day, the latter being fitted with a selection of modern machinery. Cars are also let out on hire, and new motorists instructed in the art of motoring.

THE Daimler Motor Company inform us that H.M. the King has honoured them by placing, in addition to the landaulet recently supplied, an order for a further 35-h.p. Daimler chassis.

MR. J. M'FARLANE has opened the City Motor Garage at 6, King Street, Perth, where he has accommodation for about fifty cars. All kinds of motor repairs are also undertaken at this establishment.

A NEW price list of the Continental Tyre and Rubber Company, Ltd., for the 1908 season has just been issued, and will be of considerable interest to private motorists as well as to those engaged in business.

WE regret to hear of the death of Mr. E. J. Grey, a director of the Acre Rubber Company, Ltd. The funeral took place at Finchley on Saturday, the numerous friends present testifying to the esteem in which the deceased gentleman was held.

EXCEPT for the main road from Quito to Latalounga, Ambato and Cajabamba, constructed during the administration of President Garcia Moreno and practically indestructible, there are no roads in Ecuador adapted to the use of motor-cars.

MR. GEORGE BERNARD SHAW has taken to motoring, and is learning to drive at a reasonable speed at the National Motor Academy at Notting Hill. His views on the police and magistrates will soon be as interesting as his opinions on politics and marriage.

WE learn that the Victoria Carriage Works, Ltd., have secured the British agency for the Niclausse cars, which made their debut at the last Paris Salon. The new vehicles, which will be on view at Olympia, are being made in three sizes—15-h.p., 20-h.p., and 35-h.p., all fitted with four-cylinder engines.

THE Cape Cart Hood Company, of 3, Willow Walk, Kentish Town, N.W., have issued a neat list of their specialities, which are of a high grade of quality. On one of their special hoods the device is kept extended by brass side joints, which, in addition to securing rigidity, also add to the appearance of the hood. A special feature of the company's business is the supply of glass wind screens either in the folding or permanent design. The company also repair and re-cover hoods, and altogether have become well known as specialists in this class of work.

MESSRS. STUART, MORRISON AND Co., of 199, Piccadilly, W., the sole agents for Great Britain and the Colonies for the "Durandal" detachable non-skid, have made arrangements for the prompt retreading of these bands, and in case of urgency can return the band, duly retreaded and repaired, the same day as they receive it. The "Durandal" was originally invented by a French motorist as long ago as 1898. The present pattern has altered but little in design. Large numbers of the taxicabs in Paris are shod with "Durandals," and we understand that negotiations are proceeding for fitting many of the London motor-cabs with them. To every band they send out Messrs. Stuart, Morrison and Co. attach a label showing the correct method of fitting and correct tyre pressure, also other hints for the using of this excellent non-skid, and if these hints are carefully followed motorists will be able to save themselves much of the usual tyre worry.

THE judging for the September section of the interesting Argyll competition, promoted for the benefit of private owners of Argyll cars, took place recently. The first prize was awarded to Mr. J. E. Young, of Paternoster Row, E.C., for a petrol consumption feat which probably constitutes a record. With a four-year-old Argyll, which had already covered 35,000 miles, Mr. Young made a record mileage consumption run (certified by the officials of the Automobile Club) of 40½ miles to the gallon, at an average speed of ninety-two miles per hour. This was on a highly competitive grade of spirit than the ordinary, viz., 760 Burneo, and was with a full load and on give-and-take roads. Two distinct runs were made, and on the second a result equal to forty-six miles per gallon was recorded. The only addition to the standard make of Argyll was a Bowden air inlet. We understand that the Argyll Company are now promoting a special competition amongst their various agents.

THE "MERO" CHANGE-SPEED GEAR.

A DEMONSTRATION of a new "fool-proof" change-speed gear which is about to be put on the market by Mero, Ltd., of the Mero Works, Renton Street, Sheffield, was given in London last week. We are able to reproduce a drawing showing a sectional elevation of the arrangement, from which it will be seen that the essential feature is the mechanism contained in an extension C at the rear of the gear-box proper. The object of the designers has been to overcome the drawbacks connected with the ordinary sliding pinion or *train balladeur* system of change-speed gear, which, except expertly handled, is liable to be quickly damaged owing to the difficulty of getting the different pairs of gear wheels into mesh. To this end the Mero Company, while retaining the ordinary form of change-speed gear, fit in conjunction therewith a one-way roller clutch or free wheel device A, also an ordinary sliding clutch B. The latter are mounted on an extension of the main shaft of the gear-box, to the rear of which the cardan shaft is attached through the medium of the usual universal joint. The pedal is so connected up to both the engine clutch and the auxiliary clutch B that as it is pressed forward both clutches are simultaneously disengaged. As the drawing shows, a brake or stop is provided in conjunction with the main clutch, the result being that as the latter is withdrawn the two shafts in the gear-box are rendered quite independent both of the engine and of the car, and are almost instantaneously brought to a state of rest, when any desired pair of pinions can be brought into mesh, not only noiselessly, but also without any risk of missing or stripping the gears, the pinions being free to "give" to the desired extent in either direction to allow the teeth to engage with each other. The introduction of the one-way clutch or free wheel A assists the operation in so far that it is impossible for the shaft on which it is mounted to drive, owing to the impetus of the vehicle, the gear-box shaft, when the clutch is disengaged, the free wheel then simply overrunning in the usual way. The result is that the driver has no need to trouble himself as to the exact moment of changing speed, for even should he drop from one gear to another before the car has sufficiently slackened its speed to correspond to the lower gear, the vehicle will continue to free wheel, as it were, until the road wheels are rotating at precisely the rate corresponding to the gear which has been en-

gaged, and the engine speed. When this point is reached the positive locking clutch comes automatically and quietly into operation, the drive being thus taken up without any shock. Although a one-way clutch is employed, provision is made for the use of the reverse motion when necessary.

Ere definitely putting the gear on the market, the Mero Company, of which Messrs. E. Meyer and F. Kelley are the managing directors, and Mr. J. Rothard the chief engineer, has been submitted to exhaustive trials both on a pleasure car—a 25-30-h.p. Clement-Talbot—and a Straker-Squire 'bus. On the latter it has been submitted to a 7,000 mile test in London, and we are informed that at the end of that time so successfully had the arrangement worked in practice that the file marks were still *en evidence* on the change-speed pinions. It is claimed for

the gear that it is possible to change speed even when the engine is running fast, and without having to throttle down when changing on a hill; it also enables the pitch of the teeth of the pinions to be so proportioned that even on the low speed little or no noise is made. Another great advantage it possesses is that it enables the gear to be changed without noise or injury even by motorists and drivers who have had no previous experience or training, a feature which renders it well suited for use on motor-cabs and 'buses as well as on all classes of industrial motor vehicles. The new gear will be on exhibition at the stand of the United Motor Industries at the Olympia Show, where we feel sure it will attract considerable attention.

REMOVING ROAD WHEELS FROM LIVE AXLES.

IT sometimes happens in a cardan shaft driven car that the driving wheels obstinately refuse to come off when it is desired to remove them from the live axle. An inexperienced person will often hammer furiously without even

starting the wheel, and will probably do some damage. The following simple implements will, remarks Mr. J. G. Cramer in an American contemporary, greatly facilitate matters. Two hooks S of a good quality of wrought iron or steel, about $\frac{1}{2}$ in. in diameter and about 8 in. long, threaded at the end as shown in the accompanying illustration; a plate P of the same metal, 10 in. long and about $\frac{1}{2}$ in. thick, pierced by two holes 9 in. to 10 in. apart, through which the stems of the hooks pass. Two strong nuts B are also needed. First pass the stems through the holes of the plate and start the nuts on the first thread of the bolts; then pass the hooked ends over two diametrically opposite spokes; next, rest the plate against the end of the axle and tighten up the nuts. A blow with a heavy hammer will then easily start the wheel. There are certain necessary precautions to be taken:—(1) Protect the paint of the spokes by a sufficient thickness of rags or waste; (2) mount the apparatus so that the stems will be equi-distant from the axle; (3) interpose a piece of brass between the end of the axle and the plate; (4) tighten up the nuts uniformly and evenly so that the plate is at right angles to the axle; (5) use a heavy hammer and strike squarely.

DURING the Olympia Show the White steam cars will be shown on the stand of the White Company, and also on that of Messrs. Cann, Ltd. Landauet, limousine, and double phaeton touring bodies will be displayed on both the 20-h.p. and 30-h.p. chassis.

THE "Ursus" non-skid tyres, which are being put on the market by Messrs. J. C. Lyell and Co., Ltd., of 55, Victoria Street, Westminster, S.W., are fitted with case-hardened steel bars, not studs, which are doubly riveted with a copper back plate. It is claimed that it is impossible, even after considerable wear, to pull these out. Between the band and the cover is fixed a strip of asbestos cloth, which prevents the heat penetrating to the cover. The leather band is chrome dressed, and is a practical non-skid, which has been run on high-speed cars for thousands of miles with satisfaction.

The Olympia Show.

ON Monday next the annual Motor-car Exhibition of the Society of Motor Manufacturers and Traders will be opened at Olympia, Kensington, W., by the Duke of Connaught. Throughout the week—in fact, until the 23rd inst.—the event will continue in progress, attracting attention from motorists of every degree. The Exhibition will be pre-

reputation for itself in the past. Those motorists or prospective automobilists looking for a four-cylinder vehicle at a moderate price should inspect the Star 12-h.p. chassis. The engine cylinders are $3\frac{1}{2}$ in. by $4\frac{1}{2}$ in. stroke. The ignition is by a gear-driven high tension magneto. The gear-box is now arranged to give four speeds forward and one reverse, with direct drive on third speed and gate change. It is made with either side-chain drive or a live axle. The driving bevel wheel is provided with two ball bearings, one before and the other in rear of

Fig. 1.—Chassis of Star Six-Cylinder Car.

ceded by the dinner of the Society on the 8th inst., when Mr. E. Manville, the chairman, will preside, supported by Sir William Treloar, the Lord Mayor, and Mr. C. D. Rose, M.P. Below we commence our review of the exhibits. This will be continued during succeeding issues, until all the principal changes of design and improvements introduced since the last Show have been duly set forth in our columns. The *M.C.J.*

the wheel, with a ball thrust in between. Hoffmann ball bearings are used throughout, except on the engine. The wheel-base of the car is such as to enable a roomy side-entrance body to be fitted. A 12-h.p. chain-driven car is also being shown with a landaulet body, this vehicle being particularly well adapted for the use of doctors and commercial travellers. Another interesting exhibit is a 16-h.p. car with live axle drive. The four-cylinder engine is $3\frac{1}{2}$ in. bore by 5 in. stroke. A feature of the vehicle is the change-speed gear, which gives four speeds forward, in addition to the reverse, the direct drive being, not on the top, as

Fig. 2.—Chassis of Crossley 40-h.p. Car.

stand at the exhibition is numbered 102, and will be found on the ground floor.

The Star Cars.

An interesting series of the popular Star cars, ranging from a 9-h.p. "Little Star" to the striking six-cylinder vehicle illustrated in Fig. 1, will be shown by the STAR ENGINEERING COMPANY. The 9-h.p. two-cylinder car, which is made with either chain or cardan shaft transmission, takes the place of the 7-h.p. Star, which has earned so good a

usual, but on the third speed. The new Star six-cylinder car (Fig. 1) is bound to attract considerable notice, this being one of the most imposing vehicles yet turned out by the Star Company. The frame, which is narrowed at the front to increase the look of the steering wheels, is of unusual width at the bends, in order to give strength at this point. The cylinders are $4\frac{1}{2}$ in. bore by 5 in. stroke; the ignition is by high-tension magneto, and the mixture furnished by an automatic carburettor of neat and efficient design. The transmission is through a four-speed gear-box—with direct drive on the third, with an

indirect fourth—cardan shaft and bevel gear to a strongly-built live axle. As the illustration shows, the chassis has a very clean and smart appearance. Altogether the Star Company's 1908 vehicles will be found to comprise all the most modern developments in automobile construction, and should, in view of their moderate price, meet with a large clientèle.

The Crossley Cars.

On a separate stand Messrs. JARROTT AND LETTS have an instructive display of the latest type of 40-h.p. car built throughout by Messrs. Crossley Bros., Ltd., in their extensive works at Openshaw, Manchester.

Fig. 3.—The 40-h.p. Crossley Double Landaulet just supplied to Mr. G. J. Whittington, of Betchworth, by Messrs. Jarrott and Letts.

The body has been designed and built specially by Messrs. Stamper and Son, of Wandsworth, and is complete in every respect. Mr. Whittington's house is at the top of Peebles Hill, the gradient of which is about 1 in 6, and the car has to climb this two or three times a day.

The chassis is a splendid example of British motor-car construction and merits close inspection. While the principal features have been retained, many modifications have been introduced in the 1908 model. The general appearance of the vehicle has been considerably improved by reason of the alteration in the shape of the bonnet, which is lower, and gives the car a very distinctive appearance. The frame

Fig. 4.—View of rear end of frame of Crossley 40-h.p. Car showing the three-quarter elliptical springs, the petrol tank, and the manner in which the main driving axle can be withdrawn from the tubular casing.

is built low and is well set up at the back, and instead of ordinary spring hangers three-quarter elliptical springs are now fitted. The motor, which is a splendid example of engine building, is fitted with low tension magneto ignition, with advance and retard, gear driven water circulating pump and mechanically-actuated valves. An ingenious device has been provided on the dashboard for the prevention of over-lubrication and smoky exhaust. The well-known Crossley expand-

ing metal clutch is still retained, but the adjustment has been simplified and made considerably easier. The four-speed change-gear actuated by a single lever with gate control and direct drive on top is retained. The gear is also now arranged so as to be easily dismantled when disconnecting the gear-box from the frame, in fact every part of the car is arranged with the idea of easy accessibility. The transmission is by a cardan shaft and bevel gear to a strongly built live axle. In connection with the latter it may be pointed out that the main driving axle itself is so arranged as to be easily drawn out from the casing, as shown in Fig. 4. The latter supports the weight of the frame and carriage

Fig. 5.—The Mercedes 45-h.p. Engine.

body, the axle itself having only the driving effort to withstand. Furthermore the large bevel wheel and the differential gear can be easily dismantled without removing the body or disturbing the axle. In addition to the chassis (Fig. 2) there will also be on view a 40-h.p. limousine specially designed for country work. The interior is luxuriously upholstered in corded buff cloth and seats five passengers comfortably, fitted up with speaking tube, electric indicators, electric lights, &c. The whole car is painted dark blue, picked out white lines, and is a perfect model of an up-to-date automobile. A 40-h.p. double landaulet, specially designed for town work, will also be shown. This carriage has accommodation for seven passengers and is complete in every detail.

Fig. 6.—The Mercedes 75-h.p. Six-Cylinder Engine.

The Mercedes Cars.

Some details of the 1908 models of the well-known Mercedes cars were given in the last issue of the *M.C.J.* and we are able to this week publish the first illustrations of the new 45-h.p. four-cylinder and 75-h.p. six-cylinder engines. The exhibit of Messrs. DUCROS MERCEDES, LTD., will comprise a 20-25-h.p. car, with landaulet body by Lawton, painted dark green with orange lines, and having seating accommodation provided for five persons, a 35-h.p. limousine painted carmine, upholstered in grey corded cloth, a 45-h.p. chassis, a 45-h.p. car fitted with Roi des Belges side-entrance body, fitted with double extension Cape cart hood and folding glass wind screen, and a 75-h.p. six-cylinder vehicle fitted with Pullman limousine coachwork of new design,

painted primrose with black lines, upholstered in grey corded cloth inside. This car has seating accommodation for five persons inside and two outside. Special attention may be drawn to the 45-h.p. vehicle as being the one most suitable for use in the United Kingdom. Fig. 5 gives a view of the fore part of the chassis, showing the various parts of the motor. An important alteration has been made in the ignition, as, while the low tension system is retained, there are no make-and-break rods, their place being taken by plugs containing in themselves a device on the make-and-break principle. Another improvement consists, it will be noted, in the adoption of valve covers which screw into

Fig. 7.—The Dennis 35-h.p. Touring Car.

position in place of being held by stirrups. An oil pump is attached to the base of the engine, while inspection holes, which can be easily closed, are provided in the base chamber. The Soda carburettor is replaced by one of the piston throttle type; wide plain bearings are fitted to the crank shaft, while the intermediary pinions in connection with the driving of the cam shafts have been suppressed. As regards the transmission the principal change is seen in providing two brakes on the differential shaft in place of one on the latter and one on the side shaft of the gear-box. We note also that a sharper rake has been given to the steering column and that rods are now used instead of wire cables in connection with the brakes. Fig. 6 depicts the new six-cylinder engine on which, as will be seen, the old type of low tension ignition is fitted. The illustration clearly shows the inspection covers, which can be readily detached to give access to the big ends.

The Dennis Cars.

The *piece de resistance* at the stand of Messrs. DENNIS BROS., LTD., Guildford, will be the chassis of the new 35-h.p. four-cylinder car they are introducing for the 1908 season. Fig. 8 depicts the carburettor

Fig. 8.—The Dennis 35-h.p. Engine.

side of the new motor, which has cylinders 120 mm. bore by 130 mm. stroke, and which, according to the R.A.C. rating, develops 35.7-h.p. As will be seen, high-tension magneto ignition is provided, the distributor being mounted on the upper end of a vertical spindle driven off the exhaust valve cam-shaft. A special feature in connection with the new engine is the system of lubrication. The oil is supplied from a sump in the crank chamber, a geared force feed pump conveying it under pressure to all the crank shaft bearings. Over lubrication is impossible, as all surplus oil is automatically and immediately returned

to the sump at the bottom of the base chamber. All the timing wheels, also pump and magneto pinions, are enclosed in an oil-tight case. Another new feature in the 1908 chassis is the introduction of a new type of gear-box, which is claimed not only to be silent in operation, but to be "fool-proof." The innovation consists in the introduction of a free wheel clutch, which obviates any retarding effect from the gears on the engine. The motor drives the road wheels, but the gears cannot draw the engine except on direct drive; the result is that at whatever speed the car may be travelling the driver can, without noise, change to any other gear or to neutral, the effect being that the car merely free wheels until the pace becomes slow enough to allow the engine to take up the drive, which it does imperceptibly. Ball bearings are used throughout the gear-box, and we note that the Dennis practice of a stationary secondary shaft when on the direct drive has been retained. The transmission is through the firm's well-known worm gear to a well-supported live axle. The new car is claimed to be able to run eighteen miles to the gallon of petrol. The complete cars on view include a 35-h.p. landaulet with five seats in the interior, all facing forward. The back seat has room for three passengers, and the other two being moveable seats which close up against the sides of the carriage when not in use. This model can be used as an entirely open car when required, the front pillars and glasses folding down flush with the frame, the front canopy over driver being also removable. A 35-h.p. brougham—an elegant closed carriage for town use upholstered in light carriage cloth and with seating room inside for five passengers—will also be shown, as also a 35-h.p. touring car (Fig. 7). This is fitted with a new type ideal phaeton body and equipped with a hood which enables the vehicle to be used either as a landaulet or touring machine. One of the standard Dennis 20-h.p. touring cars, with Roi des Belges body, will also be on view.

The "E.J.Y.R." Steam Car.

One of the novelties will be the E.J.Y.R. steam car, which is being introduced by the HIGHCLERE MOTOR CAR SYNDICATE, LTD.

Fig. 9.—Chassis of "E.J.Y.R." Steam Car.

of Highclere, Newbury. From Fig. 9 it will be seen that the chassis is built on similar lines to that of an up-to-date live-axle petrol car, the difference being that in place of a petrol engine a "flash" generator, as well as the engine, is fixed beneath the bonnet and that there is no change-speed gear. The engine comprises three single-acting vertical cylinders of 2½ in. bore by 3½ in. stroke, fitted with cam-operated mushroom-valves. The power is transmitted through a long cardan shaft and bevel gear to a live back axle in the usual way. This vehicle is nominally of 30-40-h.p. The burner is adapted to use ordinary paraffin oil as fuel, and a distance of about twelve miles per gallon can be covered. The fuel and water storage is sufficient for 150 miles, rendering the car, which is the outcome of several years' experimental work, especially suited for use in India and the Colonies.

The Turner-Miesse Steam Cars.

Steam car enthusiasts will, as usual, find something to interest them at the stand of TURNER'S MOTOR MANUFACTURING COMPANY, LTD., Wolverhampton. Three sizes of the Turner-Miesse steamers are this year being shown, viz., 10-h.p., 16-h.p., and 30-h.p., the wheelbase in each case being adapted to permit of side-entrance bodies being fitted to the chassis, examples of a landaulet, limousine and a double-phaeton being included in the exhibit. These cars are so well known that it is almost unnecessary to give a description. We may briefly mention, however, that the generator is of the flash type, made in four sections, so that the bottom section can be replaced at trifling cost when necessary. The burner uses ordinary paraffin or kerosene as fuel. Now that the cost of petrol is advancing this is a point of great importance. In the colonies, and other places where petrol is difficult to obtain and prohibitive in price, it is an even greater advantage to be able to use

paraffin. The engine is of the three-cylinder single-acting type, its great feature being there are no glands or packing to require attention. The control is extremely simple, one pedal and one lever being all the driver has to attend to. The lever governs the supply of water to the generator, and therefore regulates the speed, the pedal instantaneously cuts off the steam and when depressed still further puts a double-acting brake on the crank-shaft. The advantage of this system is that the driver cannot carelessly put on his brake before cutting off the power. The cars exhibited show several improvements. A burner regulator is now fitted, by means of which the furnace can be turned up and down like a gas stove, so that the car can be kept waiting about, and yet be ready to start at a moment's notice. A feed water heater is also fitted, which utilises the exhaust steam to heat up the water on its way to the generator. This effects the two-fold purpose of cooling the exhaust steam before it enters the condenser, and of heating up the water on its way to the generator. The makers claim that this addition improves the running of the car fully 20 per cent. The 30-h.p. Turner-Miesse car is an entirely new model; it is fitted with a three-cylinder engine of similar design to the older types, but, of course, of greater capacity and with several improvements, extra powerful brakes being also fitted. The engine can be run free, which is a great convenience for pumping up tyres, &c. The transmission is by means of a single Renold silent chain. The Turner steam cars in general appearance closely resemble a modern petrol car. There is, of course, no vibration, and there are no change-speed gears to manipulate, the pace being entirely regulated, as already stated, by the amount of water that is allowed to pass to the generator.

The Beeston Humber Cars.

The output of the Beeston factory of Messrs. HUMBER, LTD., is being confined to two four-cylinder models, of respectively 20-h.p. and 30-h.p., and the exhibit will comprise examples of both, including a 20-h.p. side-entrance double phaeton and a 30-h.p. landaulet. Dealing

the foot platform is filled in to prevent splashing of mud. Turning now to the new 30-h.p. vehicle, this is equipped with a slow-running engine, having the cylinders cast in pairs. The bore and stroke is respectively 120 mm. by 150 mm. The carburettor is very much on the same lines as that on the 20-h.p. A novel departure is, however, seen in the ignition, two types of magneto being fitted, the Eisemann high-tension and a Simms-Bosch low tension, the tappets of which are worked by means of an overhead shaft driven by the half-time gear. On this car the clutch is of the multiple disc type. The four-speed gear

Fig 11.—The Engine of the new Panhard 15-20-h.p. Live Axle Car.

box, which is provided with ball bearings, is a new design. When on the top direct speed the side shaft remains stationary, the pinion which transmits the drive to it being also moved out of engagement when the high speed clutches are engaged. The transmission is by bevel gear to a live axle; the cardan shaft, which has only one universal joint, is provided with a casing which acts as a radius rod. The springing has been re-designed, the rear springs being now on the three-quarter elliptical pattern. Provision is made for the fitting of a self-starting arrangement to this car. Fig. 10 depicts a 30-h.p. Beeston Humber with side entrance double phaeton body and Cape cart hood. The latter is of a new design and is made by the Humber Company. On the wooden members which support the canvas slots and studs are fitted, so that when the hood is folded up the members are incapable of moving, and so cannot pinch the canvas and wear it by chafing. To the front extension of the folding hood a short curtain is attached, which in stormy weather can be folded

Fig. 10.—The Beeston Humber 30-h.p. Side-Entrance Double Phaeton with Cape Cart Hood.

first with the 20-h.p. type, which is the outcome of the company's experience in the Tourist Trophy race, the four-cylinder engine has a bore and stroke of 105 by 130 mm. The cylinders are separately cast and have the mechanically-operated valves arranged on opposite sides. The carburettor is of the automatic type, and is claimed to be very economical, enabling the car to run twenty miles to the gallon. The throttle is controlled both by a foot accelerator and by a lever on the steering wheel. An automatic system of lubrication is fitted to the crank case, actuated by a small rotary pump which is gear driven from the engine. The base chamber is provided with a large sump containing oil, while the precaution has been taken to have a foot-operated lubricator on the dashboard, from which oil can be admitted to the engine when an extra quantity is necessary. Two systems of ignition are provided—the latest Eisemann high-tension magneto and coil and accumulators. The high-tension distributor of the magneto is used in conjunction with the coil ignition. The clutch is of the ordinary leather-faced cone type, a ball thrust and a neat form of clutch brake being provided. The change-speed gear gives a direct drive on the top fourth speed, through the cardan shaft and bevel gear to a live axle, and ball thrust bearings are provided to take the side thrust on road wheels; the latter run on ball bearings on the axle sleeves. The driving shaft and bevel pinion shaft also run on ball bearings, and thrust bearings are fitted on either side the bevel wheel and behind the pinion to reduce friction. The chassis is carried on five springs, the transverse one being now supported on a special bracket, instead of on a spindle bolted on to the frame. The foot brake, which is lined with cast-iron segments, is very easily adjusted by means of a butterfly nut fitted with a spring catch. We note, too, that steel cables have been done away with for controlling the side brakes, rods being now fitted. The car has a wheel base of 9 ft. 3 in., enabling a roomy double phaeton Roi des Belges body with side entrance to be fitted. The whole of the sides of the car between the frame and

Fig 12.—Rear View of Chassis of Panhard 15-20-h.p. Live Axle Car.

over, so that wind and rain cannot get in between the top of the screen and the front under portion of the hood.

The Panhard Cars.

The exhibit of Messrs. PANHARD AND LEVASSOR is this year an exceedingly interesting one, as it marks the appearance for the first time of a Panhard car with a live axle. Of the more familiar types the display includes an 8-11-h.p. three-cylinder single landaulet, an 18-h.p. chassis, an 18-h.p. three-quarter landaulet, fitted with a new and simple

self-starting apparatus, and a 25-h.p. special cabriolet. While the general lines of these cars remain unchanged several detail alterations have been made. The high-tension magneto system of ignition is retained. The magneto is, however, now gear driven. A new lubricator is fitted to all models, the principle of which is to automatically supply the engine with more or less oil as required. The centre of attraction will, however, undoubtedly be the chassis of the new 15-20-h.p. live axle vehicle. This is a departure which has only been definitely introduced after exhaustive trials, the design having been tested on a transport lorry in the recent French military manoeuvres and on cars competing in various races. The motor (Fig. 11) comprises four separate cylinders with ample water jackets and five bearings to the crank shaft. The bore is 91 mm., and the stroke 130 mm., while the normal speed is 1,000 revolutions per minute. The mechanically-operated valves are arranged on opposite sides. Two systems of ignition are provided—high tension magneto and accumulators. The mixture is furnished by a hydraulically governed Krebs carburettor, fitted with hot water jacket. The clutch is of a new metallic type, and is operated by a push pedal in place of the press down variety to which the Panhard Company have so long adhered. The clutch is entirely eased in, rendering it oil tight, as well as dust proof, besides greatly adding to the rigidity of the transmission mechanism. The change-speed gear gives four speeds forward and a reverse, all actuated by one lever. On the top speed the drive is direct through the cardan shaft and bevel gear to the axle. A feature of the design of the latter is the ingenious arrangement for allowing of obliquity of the live axle. The frame, which is raised at the rear to clear the differential casing, is of pressed steel, wooden side members being attached to it to form a foundation for the body work without the necessity of drilling a number of holes in the frame proper. The springs are of good length, those at the rear being of the three-quarter elliptical type. A new departure which is now being applied to the 15-20-h.p. car, as well as to all the other models, is seen in the fact that in addition to the usual foot and hand-controlled brakes, an engine brake is now provided. This is obtained by modifying, through the medium of a small pedal, the play of the exhaust valves in such a way as to obtain resisting efforts during the time of inlet, compression and expansion. The arrangement is realised by means of extra cams, which act on the valves by means of a longitudinal displacement of the cam shaft. This brake, which can be thoroughly depended upon, and the working of which requires no effort on the part of the driver, is particularly adapted to long downward slopes and hilly districts; it prevents overheating of either the foot or band brakes.

Fig. 13.—The Renold Rotoscope.

Silent Chains.

One of the most interesting displays in the Gallery will be that of Messrs. HANS RENOLD, LTD., of Manchester. They will demonstrate one of their Renold silent chains running at 1,000 ft. per minute. The Rotoscope will be employed, so that interested visitors will be able to observe the action of the links coming into gear with the wheel teeth. The firm will also show a full range of roller and patent bearing silent chains in the various sizes designed for pleasure and touring motor-cars, as well as for motor-buses and wagons and commercial automobiles generally, a collection of pieces of roller chains which broke under test loads reaching 86,300 lbs., and chain wheel milling cutters. Other tools necessary for the proper use of Renold chains will be included in an exhibit of considerable practical importance.

Vulcanisers.

In the way of novelties in vulcanising appliances, Messrs. HARVEY FROST AND CO., LTD., will have something of interest at their exhibit in the Gallery. The popular little H.F. "Car" vulcaniser, which has found ready acceptance, will be shown in somewhat improved form, although the features that have contributed so largely to its efficiency are, of course, retained. The motorist will find his interest attracted by the H.F. garage vulcanising equipment, which includes the H.F. "Car" vulcaniser previously referred to in our columns. This equipment has undergone some improvement since last year, and is even more efficient than it was before; so much so, that even in the hands of an inexperienced operator drastic repairs can be executed with expedition and thoroughness by the car owner in his own garage, or by one of his chauffeurs or mechanical assistants. The special vulcanising materials and tools, to which Messrs. Harvey Frost and Co., Ltd., have given much careful attention, will be shown, in addition to several most interesting trade appliances, such as the H.F. "Re-treaders," both carrying improvements, the "Standard" A and B appliances, a very ingenious tool called the H.F. "Jointless Joiner" for joining motor tubes, &c. Convincing evidence of the thoroughness of the "Harvey Frost" vulcanising process will be available for public investigation.

The "Atlas" Jack.

Messrs. A. W. GAMAGE, LTD., will have their usual comprehensive display of accessories and clothing of every description for motorists. In the latter department there will be several novelties of interest, among them the gentlemen's "Motura" detachable lining coat, recently illustrated in the *M.C.J.* Other specialities in Irish frieze as well as leather overcoats will also be on view. In the ladies' section a new reversible coat, which can be worn with the leather or tweed outside according to the weather, will be on view, as well as several good designs of fur coats. In gloves, hats, veils, caps, &c., there will be a comprehensive selection; while several new forms of trunks for the motor-car will attract considerable attention.

Fig. 14.

Fig. 15.

These are distinguished by good workmanship as well as practical utility. Messrs. Gamage will also exhibit the special trunk with which they secured the Silver Cup at the show of novelties recently held at the Hotel Cecil, London. We illustrate the new "Atlas" combination pneumatic and ratchet jack which the firm are now marketing. When the jack has raised the car sufficiently one or both of the pins are inserted in the device, and the car remains in position until the operators wish to lower it. Even should the pneumatic section fail, the ordinary ratchet is there to prevent mishap. The descent of the car is insured by merely releasing the pin and slightly turning a thumb-screw. The speed and ease of the lift are points of considerable favour as regards the "Atlas." In Fig. 14 the device is shown closed, and in Fig. 15 the ratchet attachment with the jack is shown. In horns some new forms will be seen, the "windproof" being a new and ingenious pattern having no trumpet. Whistles to work off the exhaust and syrens will also be included in the exhibit. High grade unspillable accumulators, non-skid tyres, sparking plugs, and all accessories, will be comprised in the display.

Motor Accessories.

The UNITED MOTOR INDUSTRIES, LTD., will have a number of novelties as well as a complete display of their standard accessories. The "Castle" accumulators will be shown with entirely new plates, so constructed that separators are not necessary. At the same time, it is impossible for any trouble to ensue; the whole of the plate on either side is always exposed to the action of the acid, and the fullest possible capacity is therefore always obtained. In the "Castle" coils the separate condensers will be of interest to car manufacturers, as they increase the power of any engine at a very little extra cost, and without any alteration whatever to engine or chassis. A new adjustable "Castle" trembler, which can be adjusted by the turn of a screw to take varying voltages at will, is a very ingenious development in induction coils. The Eisemann magnetos, for which the United Motor Industries, Ltd., are sole British agents, have entirely new lines for 1908, and these models will be shown. The chief point of alteration in the new models of these magnetos is the simplicity of mounting and dismounting the parts. All the magneto can be taken to pieces and put together without using a tool. There will also be on this stand a selection of Dubrulle lubricators, for which this firm are now British agents. The "Castle" jack is one that is coming rapidly to the front, and their new screw-up jack, which has an eccentric action, and which is illustrated in Fig. 17, will be shown. There will be a full

Fig. 16.

Fig. 17.

exhibition of the L.M. plugs, including a new plug known as Model "O," for magnetos, and a new combined primary and secondary distributor in aluminium case. The latter is a light and compact article, probably the smallest combined distributor on the market, yet at the same time effective. A device that will interest many visitors is the "Nonex," which can be fitted to any petrol tank, rendering an explosion from petrol impossible. There will be a fine range of other "Castle" specialities, including horns, speed indicators, charging sets, side lamps, etc., as well as the "Wagner" electric horn and Mutel motor.

(To be continued.)

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-29, Charing Cross Road, London, W.C.]

THE TRANSMISSION QUESTION—LIVE AXLE v. CHAIN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 19th ult. I think your correspondent "T. W. H." has overlooked what perhaps one might almost say is the most important factor in public opinion, viz., the silence of most live axle cars, as compared with that of chain driven ones, due to wear of the chains, badly cut or worn sprockets, and so forth. Except for this I think we should find that every car would be constructed with chains, excepting those makers who, as your correspondent rightly says, go for cheapness. Have we not two or three notable examples within the last few weeks of manufacturers, who were the pioneers of chain-driven cars, suddenly taking to making live axles, and one naturally asks why? and the only solution is that the public will have a quiet car.

Further, let us consider the "real" advantages of a chain drive

TYRE TROUBLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I write to ask if any fellow motorist has had any trouble similar to the following, and if so, will he kindly advise me as to what he found the best course under the circumstances?

I had two new grooved tyres of a well-known English make, 815 by 105, on the driving wheels of my 20-h.p. Humber car, which I have carefully driven myself, and over good roads only, the tyres being kept at 80 to 82 lbs. pressure, as tested by a gauge, and as recommended by the makers.

After doing only 2,000 miles, and with the grooves not yet nearly worn down, the canvas of the off driver split diagonally for a length of eight or nine inches, almost from one bead to the other, the split being as clean as though cut with a knife, the outer rubber (which had no cut previously) bursting at the same time some two or three inches.

The Queen of Holland arriving by Motor-Car to witness the recent Dutch Military Manœuvres.

[De Auto.

in order. (1) The strain (i.e., the surface over which a certain amount of work is distributed) on the differential is less per tooth in a chain-driven car because the countershaft revolves three times or so as fast as the corresponding live axle—that is to say that whereas in the same speed of engine and road wheels the one tooth in the bevels, &c., has to do the work of three in the fixed axle type. (2) When driving with a fierce clutch or other sudden strain imposed on the mechanism, the chains will give and in some cases act as an electrical fuse does to a conductor, but who shall say what happens in a live axle! (3) In a live axle there is always a big torsional strain on the propeller shaft, so undesirable in motor construction. (4) Chain driven cars do not require so many universal joints and their consequent troubles as in live axles. (5) No chains should be noisy, provided they are well made, have been and are well greased and cleaned and the sprocket wheels are technically correct. (6) In conclusion, do not these facts, coupled with those of your capable correspondent "T. W. H." and many other points that I dare not mention for fear of trespassing on your valuable space, point in favour of the chain?—Yours truly,

KENNETH J. GARLE.

I returned the cover to the makers, whose only suggestion is to send me a new cover at two-thirds list price; but manifestly, at this price, a new cover would prove a very expensive one if it would not do one-third the mileage it should.

If any fellow motorist can suggest a way of getting more wear out of the cover in place of scrapping it, I shall be obliged.

Would dovetailing a new piece in, as advertised by some firms, make a satisfactory job?—Yours truly,

G. S. PACKER.

NEW ROAD WANTED.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been asked several times by motorists when the new road to Lynton and Lynmouth was to be made. Would you kindly let me say, after much effort, that the Rural District Council have undertaken to make it on condition that £300 is found locally. As it would be a great thing to get the work done before next motoring season, the money should be found soon. We have got promises of £200, and should be very glad if any motorists who intend coming this way would help us by sending contributions to me, at Lynmouth, or Mr.

T. Jones, Lynton. I need not say the road will be of the greatest service to motorists, as by means of it the hill at Porlock and Countisbury will be avoided.—Yours truly,

E. B. JEUNE.

THE TRADE POSITION ON THE CONTINENT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have read the article headed "The Trade Position on the Continent," which appeared in your issue of October 28th. We venture to point out to you that the new Panhard price list cannot be regarded by any means as indicating a crisis, or even the commencement of a slump in the automobile industry. This price list is accepted in France as the saviour of the position, and it has completely checked the panic which was certainly threatened.

The Panhard list is a perfectly conservative one. The reductions are in the prices of their high-powered cars, which hitherto were comparatively excessive. On the other hand, the difference in the prices of the cars of lower power is much slighter. We would feel obliged if you would give publicity to the fact that we have no old stock in the English branch of Panhard and Levassor, and that the cars we have for sale are not 1907 types, but the new 1908 types, and that, whatever other people may have done, we have studiously avoided overloading ourselves with old stock.—Yours truly,

HARVEY DU CROS.

MOTORING IN SOUTH AFRICA.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am sending you a photo showing the style of ground encountered between Port Elizabeth and Bulk River, where there is a reservoir supplying this town. The car in the photo, which is the first motor vehicle to get there and back, is my 10-12-h.p. Gladiator, and at

the time of photographing we had to shed passengers and use "man power" to get over the crest of the hill, not so much because of the gradient, about 1 in 4½, but rather owing to the loose sand and small rocks lying about.—Yours truly,

FRED. E. CORIN.

MOTOR PASSENGER SERVICES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Doubtless it has occurred to you that in the event of a railway strike motor-cars might play a prominent part in relieving the consequent congestion of passenger traffic. Being interested in the industry, we made the following suggestions to the Society of Motor Manufacturers and Traders, Ltd., and with their approval bring it before the motor-car manufacturers of this country.

We suggest manufacturers of motor-cars circularize each of their customers and ascertain whether, in the event of a railway strike, they would be willing to offer occasional service with their car, for the purpose of keeping open regular passenger communication between the large towns in Great Britain. In the event of a sufficient number of favourable replies being received a meeting of the trade would be called to consider and arrange the details of district control and management.

In the first instance we are desirous of ascertaining the feelings of the trade towards such scheme, the object of which, of course, is to advertise the industry and prove the utility and necessity of the motor-car. If anything is to be done, a meeting should be convened early to elect officers and proceed to business.—Yours truly,

RIPPINGILLE'S ALBION LAMP COMPANY, LTD.

THE MOTORIST OF MODERATE MEANS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in reading your comment of November 2nd, wherein you referred to some figures given by Mr. Chiozza

Money, M.P. That gentleman has apparently failed to appreciate the importance of the dwellers in flats in coming to his conclusions, and has based his views only on those who occupy houses.

So far as London is concerned the extension of the flat system of living during the last decade has been a notable feature of the situation. A goodly number of folks nowadays prefer the convenience of the flat to the inconvenience of house occupancy, and it is safe to say that many of these might be added, so far as rental value is concerned, to the category of rentals of over £80 a year. This section of minded people can also be regarded as motorists either actual or prospective, seeing that the economy in house expenses often effected by the flat system has given them opportunities for the enjoyment of motoring.

Mr. Money has established himself in a great measure as an authority on statistics, and, in view of the interest of this phase of the question to the motor industry, could he not be persuaded to give us some estimate as to the additions to his analysis of house owners that might be made if those who dwell in flats were also reckoned in the returns?—Yours truly,

A SUBURBAN MOTORIST.

THE OUTLOOK.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Is there an approaching slump in the motor industry? Has it reached and passed its zenith, or is it that it is being overcrowded by ambitious aspirants?

A year or two ago it was comparatively easy for a man well qualified in his business to secure a good berth. He was even sought after to fill inferior, though at that time well-paid positions. But today he has to search—more often than not without success—for a position of any kind.

I have based these observations on my own personal experience within the last few weeks. I have been connected with the practical side of the trade for six or seven years. I have worked at all its branches, from the building of chassis to repairing, testing and driving of high-class cars. During one period I held the position of foreman in a large and well-known works, and have references as to general character and ability, yet I cannot obtain a post at the bench or even as a driver.

I have called on nearly every London establishment of any importance and written to scores of others, and have always encountered the same remarks, "We have no vacancies. Things are very quiet, and we do not know when trade will brighten up." This seems to be a deplorable state of things for what is supposed generally to be a flourishing industry just in its infancy.

After being so long associated with the car it will seem strange to go back into the less interesting, but less capricious and more staid branches of engineering, viz., the marine and loco. sections. Still needs must if nothing else is forthcoming.—Yours truly,

BRITISH MECHANIC.

LOSS OF POWER.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I recently purchased a two-cylinder Decauville shaft driven car. No doubt it has seen several years' wear, but for a cheap car works remarkably well except on hills. As soon as a load is put on the vehicle the engine loses power considerably and on a very stiff hill is entirely beaten. What is the probable cause of this? Will it be the adjustment of contact breaker? The one belonging to car is a platinum tipped rocking arrangement, but the coil has, I think, been since fitted and is of the trembler type. Will not this be likely to account for the loss of power? The engine does not appear to overheat and everything seems in fair order, with compression remarkably good. The power appears ample on the level and the engine then appears to be developing full power, but on a hill it seems to have no more power than a small motor-bicycle. If you can help me to get satisfactory working I shall feel grateful.—Yours truly,

NOVICE.

[There are numerous causes which may individually or collectively account for the mysterious loss of power on hills, which seems to be quite epidemic just now with buyers of small second-hand cars. Since "Novice" is sure the compression is remarkably good (which is a cause that otherwise we should suspect as a probable reason) we advise him to examine the springs of the inlet valves, which in this case are A.O.V. The spring of one may be stronger than the other. He should test them by pressing the ends of the stems together, and then notice if one opens before the other lifts from its seat.

The trembler coil, if a good one, and properly adjusted, should not adversely affect the power, although a trembler coil gives best results with a wipe contact. Test the engine for misfires by running it very fast, and open the compression taps to watch if there is a sharp regular explosion of equal strength in each cylinder. Then again the carburetor may require attention; this is probably a Longuemare, and might give better results by changing the air cone and spray nozzle.

There may also be undue friction in the transmission gear, which is aggravated when the extra load of hill climbing commences. Jack up the rear wheels and see if everything is perfectly free, and without a grinding noise on the low speed. Finally, do not expect too much speed on hills out of a little second-hand car, and be careful in driving to put in the low gear before the engine begins to labour.]

CLUBS AND ASSOCIATIONS.

MOTOR CLUB.

IN order to celebrate their amalgamation, the Motor Club and the British Motor Boat Club have conjointly given a dinner, followed by a concert to their members, at the Motor Club, Princes Buildings, W. Colonel W. Bosworth and Admiral Sir William Kennedy, K.C.B., the respective chairmen, presided over a large attendance of well-known members of both clubs. Among those present were Mr. W. Miall Green, rear commodore B.M.B.C., Sir Thomas Dewar, Messrs. W. Gibbons, D. B. Colls, F. May, Mawdsley Brooke, Charles Jarrott, Harvey du Cros, J. Amery Parkes, W. Jenks, J. F. Avila, and R. B. Robinson, secretary B.M.B.C.

After the loyal toasts, Colonel Bosworth referred in feeling terms to Mr. Holmes Kingston, the late secretary of the Motor Club, and the excellent work he had done. As regards the amalgamation which they were celebrating, he pointed out the mutual benefit the two bodies would receive, as each had made its mark in its own sphere.

Admiral Sir W. Kennedy, in replying, thought the idea of the union an extremely happy one, and anticipated a glowing future from their combined enterprise.

CRYSTAL PALACE.

THE members' hill climb of this club on Saturday was a success. Close on twenty members had entered their cars, and many others were present as spectators. Great assistance was rendered to the club by Lieut.-Col. Carleton-Smith and many others as clerks of the course, &c.

The times were taken by Messrs. F. T. Bidlake and H. Swinley. The former also worked out the results under the Royal A.C. formula as follow:—

	Car.	Entrant.	Efficiency ratio.
1st. ...	10-h.p. De Dion ...	Dr. J. E. L. Bates ...	96
2nd. ...	6-h.p. Rover ...	L. Wix ...	93
3rd. ...	40-h.p. Napier ...	S. F. Edge ...	92

The fastest time of the day was accomplished by Mr. S. F. Edge's 60-h.p. six-cylinder Napier.

THE INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS.

THE winter meetings of this Association will be held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W. The programme for the remainder of the session is as follows:—December 11th, Mr. Dugald Clark, "The Principles of Carburetting as determined by Exhaust Gas Analysis"; January 8th, Dr. H. S. Hele-Shaw, "The Fuel Question"; February 12th, M. F. W. Lanchester, "Some Problems peculiar to the Design of the Automobile"; March 11th, Mr. J. S. Critchley.

LADIES'.

NEW members of the Ladies' A.C. include the Hon. Mrs. Bagot, Mrs. A. E. Clerk, Mrs. Stuart Coats, Mrs. Cornwallis-West, Mrs. Hay Drummond, the Hon. Mrs. Egerton, the Viscountess Emlay, Mrs. Eyre, Mrs. George Forbes, Mrs. Egerton Green, Mrs. J. M. Gorham, Miss Kelly, Mrs. E. Lingard Lucas, Mrs. McGildowry, Mrs. R. B. Muir, the Hon. Mrs. E. S. Trafford, and Mrs. Alfred Westmacott.

TRANSVAAL.

A ROAD contest has been held by the Transvaal Automobile Club for the Park Trophy. This took the form of a two days' reliability trial. The first day the run was from Johannesburg to Potchefstroom, the return journey being made on the following day, a distance of 90 miles each way. The event was regarded as a great success and some excellent performances were accomplished. One of the most notable was that of the 10-h.p. Siddeley, which—although the course was by no means of the best and contained a bad patch of road near Doornakop—made the entire journey at an average rate of 22½ miles an hour, with the use of only 4½ gallons of petrol.

THE annual dinner of the Hertfordshire C.A.C. will take place on the 7th prox., at the Hotel Russell, Russell Square, London.

TICKETS for the dinner of the Society of Automobile Mechanic Drivers at the Hammersmith Town Hall, on the 20th, can be obtained from the hon. secretary, Rawling's Garage, Halkin Street, Belgrave Square, S.W.

THE annual event of the Motor Cycling Club known as "The Show" run will take place on Sunday, November 24th, to "The Old Sal" at Barnet. All motorists engaged at the Stanley Show are cordially invited to take part in this run.

PRINCE DORIA OF ROME has just ordered three Stepney wheels. As there seems to be a misunderstanding amongst motorists with regard to the Stepney Combination Wheel, it should be noted that this is suitable for a car having front and back wheels of different sizes. There also seems to be a wrong impression abroad that the spare wheel is not suitable for heavy cars. This is erroneous, since the wheel is suitable for cars weighing up to three tons.

THE END OF THE M.U. AND A.A. CONTROVERSY.

THE correspondence between Mr. C. D. Rose, M.P., Chairman of the Motor Union, and Colonel W. J. Bosworth, Chairman of the Automobile Association, referred to in our "Comments," is as follows:—

October 28th, 1907.

Dear Colonel Bosworth,

I must apologise for having so long delayed replying to your letter of the 15th inst. It was not possible, however, to convene a meeting of the General Purposes Committee of the Motor Union until yesterday evening, and I have now the pleasure to inform you that I am authorised by my committee to say that, with the view to restoring cordial relations between our two associations, they are prepared to modify the existing Motor Union badge in such a manner as may be mutually agreed upon between us, and, further, are willing to agree that all matters appertaining to the patrolling of the roads should be the special sphere of your Association, and they will accordingly give instructions for the withdrawal of their road scheme. My committee agreed to the foregoing on my assurance that your association would, on their part, be willing to recognise that such matters as sign and danger posting work, dealing with the dust question, and the general question of the improvement of the roads should be left to the Motor Union under the existing arrangement with the Royal Automobile Club, and they will also leave the Motor Union all matters relating to insurance and legislative and general legal work. I earnestly trust that you will see your way to confirm the assurance I have given to my committee, in order that henceforward both associations may mutually assist one another in the important work that lies before them.

Yours faithfully,

(Signed) CHARLES D. ROSE.

One of the Motor-Bicycles with Side Car Attachment now being used by the Austrian Postal Authorities in the Collection of Mails in Vienna.

C. D. Rose, Esq., M.P.,
1, Albemarle Street, W.

October 30th, 1907.

Dear Mr. Rose,

I am much obliged to you for your letter of the 29th inst., and for your courtesy in sending it in time to be considered by my committee yesterday. My committee went fully into the questions in your letter, and I am now authorised to say that we accept entirely the suggestions which you make, and note that the Motor Union badge will be modified on the lines which we have previously discussed. You will, I have no doubt, recollect that in our discussion we agreed that no objection was to be raised to our continuing to put up and maintain village signs, in accordance with an understanding arrived at with the Royal Automobile Club and the Motor Union, and to which I had occasion to direct your attention some time ago, and that also in abstaining from general legal work, we shall not be precluded from undertaking the defence of our individual members or staff, if necessary. If these small matters are understood, I think I may say that we are in entire agreement and shall have great pleasure in working heartily with the Motor Union for the benefit of automobilism in general. I cannot close this correspondence without taking the opportunity of thanking you for your great courtesy and tact, which alone has made it possible to put an end to the unhappy situation that had arisen, and which my committee appreciate as fully as I have had reason to do myself.—I am, sincerely yours,

(Signed) W. J. BOSWORTH.

THE CALTHORPE MOTOR COMPANY, LTD., have been favoured with an order for a 16-20-h.p. Calthorpe landaulet by the Jam Sahib of Jamnagar, for use whilst His Highness is touring in England.

THE HOTCHKISS LONG DISTANCE TRIAL.

THE R.A.C. CERTIFICATE OF PERFORMANCE.

April 29th to August 20th, 1907.

THIS is to certify that a 45-h.p. six-cylinder (by R.A.C. rating 49.2-h.p.) Hotchkiss car, cylinders 115 mm. by 120 mm., completed a long distance trial of 15,000 miles, under ordinary touring conditions, and under the continuous observation of officials appointed or authorised by the Royal Automobile Club, on August 20th, 1907, the car being locked up each night by the official observer. The weight of the car ready for the road, excluding passengers, was 3,880 lb. The weight of the passengers and baggage averaged 868 lb.

During the 15,000 miles, the car travelled in England, Wales, Scotland and Ireland. In Ireland it took part in the Irish Reliability Trial, visiting Dublin, Portrush and Waterford amongst other places. The car then returned to England and resumed its tour throughout the country.

The record of performance, including all stoppages, repairs, replacement and adjustments on the road and in the motor houses is as follows:

ON THE ROAD.

Involuntary stops.		Time occupied.	
		h. m. s.	
1st stop .. 12th day ..	Leather grease cap on forward end of cardan shaft fell on exhaust pipe and took fire	1 15 0	
2nd stop .. 21st day ..	To inspect broken spring on off front wheel	0 1 0	
*3rd stop .. 30th day ..	Petrol failed to reach carburettor on steep hill. Car driven up backwards	0 3 42	

* An accidental detour from the original route had caused the tank to be almost empty at this point.

The remaining 10,474 miles were completed without an involuntary stop, other than for tyre troubles.

IN THE MOTOR HOUSES.—The total time spent in repairs, replacements and adjustments (other than tyre repairs), in the motor houses during the 15,000 miles run was 9 hours 44 min. 21 sec., or at the rate of 6 min. 5 sec. per day of twelve hours.

A new petrol tank was voluntarily fitted for a special test, which was not undertaken, and was not necessitated by any trouble with the old tank.

TYRES.

The car was fitted with Michelin studded tyres 880 mm. by 120 mm. front and back.

The record of performance is as follows. (The tyres which did duty on different wheels bear the same letters in brackets, other tyres when removed from any wheel for any cause were not used again even though in good condition):—

On off front wheel.		Cause of removal.	
927 (a)
1,507 (b)
54 (c)
3,181	..	Puncture; removed in fairly good condition.	
1,309 (d)	..	Burst.	
22 (e)	..	Burst.	
1,865	..	Puncture; removed in slightly worn condition.	
2,450	..	Puncture; removed in slightly worn condition.	
1,853	..	Burst.	
1,853	..	End of trial; tyre in good condition.	
15,000

On off hind wheel.		Cause of removal.	
927 (b)
1,075 (a)	..	Puncture; removed in slightly worn condition.	
423 (c)	..	Badly worn.	
54	..	Good condition; removed as a precautionary measure.	
935	..	Leaky valve.	
1,454	..	Burst.	

On off hind wheel.		Cause of removal.	
1,783	..	Burst.	
24	..	Burst.	
24 (e)	..	Burst.	
878 (d)	..	Burst; studs worn out.	
1,542	..	Puncture; removed in slightly worn condition.	
995	..	Puncture; removed in good condition.	
799	..	Puncture; removed in good condition.	
1,114	..	Burst.	
2,196	..	Burst.	
567	..	End of trial; tyre in good condition.	
15,000

On near front wheel.		Cause of removal.	
927 (f)
1,258 (g)
305	..	Puncture; run on rim back to motor house.	
1,588	..	Deep cut; otherwise good condition.	
4,192	..	Puncture; studs worn.	
4,318	..	Burst.	
2,402	..	End of trial; tyre in good condition.	
15,000

On near hind wheel.		Cause of removal.	
927 (g)	..	Puncture; removed studs, slightly worn.	
75 (f)	..	Puncture; removed in fair condition.	
1,420	..	Burst.	
13	..	Puncture; old tyre.	
54 (b)	..	Burst and worn; studs missing.	
1,653	..	Burst.	
2,642	..	Burst.	
1,220	..	Puncture; removed in fair condition.	
1,762	..	Burst; removed in fair condition.	
1,458	..	Puncture; removed in fair condition.	
796	..	Burst; removed in fair condition.	
1,391	..	Burst; removed in fair condition.	
1,589	..	End of trial; tyre in fair condition.	
15,000

Ten covers were mounted on the off front wheel, of which eight were used solely on this wheel, counting last cover. Sixteen covers were mounted on the off hind wheel, of which twelve were used solely on this wheel, counting the last cover. Seven covers were mounted on the near front wheel, of which six were used solely on this wheel, counting last cover. Thirteen covers were mounted on the near hind wheel, of which twelve were used solely on this wheel, counting last cover.

The longest distance run on any hind cover was 2,642 miles, and on any front cover 4,328 miles. The majority of the tyres when removed were not entirely worn out. The shortest stoppage due to a puncture was 4 min. 39 sec., and the longest 1 h. 9 min.

CONSUMPTION.		Number of days' trial	
Average daily mileage	96
Average car miles per gallon	156.25
Average gallon per ton-mile	7.71
Average ton-miles per gallon	16.36

REMARKS.

After the completion of the 15,000 miles, covered in ninety-six running days over all classes of roads, between April 29th and August 20th, 1907, the car was driven to the Club Motor House in Brick Street, W., and was found to be in good condition upon examination by the Technical Committee. Practically no play was noticed in the big ends of the connecting rods, although a slight amount of wear was noticeable in some of the gudgeon pins. The valves had not been touched during the trial, and were in good condition, especially considering the distance over which they had been in use without regrinding.

Except that the reverse idle pinion was slightly turred, the first speed driving pinion, and the bevel wheel on the driving axle slightly worn, the whole of the gear was in good condition. Wear was noticeable in the bushes of the bevel pinions of the differential gear of the four-way spider spindles, and these spindles were worn at the ends where they are held in the differential gear-box, apparently as the result of the bolts holding the two parts of the box together being loose. Slight wear was observable in the propeller-shaft universal joints. In the ball bearings of the road wheels the spring and washer separators between the balls showed undue wear and deformation. The horizontal spindle of the steering-arm in the steering-box was much worn at its journals, and the bearings in the box were also much worn. The pins of the front spring shackles were much worn, owing to difficulty of lubricating them.

Considering the great mileage, the wear to which attention has been directed may be looked upon as small, and less than might be expected with the exception of the spring shackle pins.

J. W. ORDE, Secretary.

October 28th, 1907.

C. D. ROSE, Chairman R.A.C.
Mervyn O'GORMAN, Chairman of
Technical Committee.

THE many motorists who have been waiting for further news of Miraculum, the new puncture sealer and rubber preservative, will be glad to learn that the E. M. Bowden's Patents Syndicate, Ltd., has now completed its arrangements and is prepared to charge customers' tyres with this preparation without delay. It should be noted that tubes must be sent to the works to be filled, as at the present stage it is not deemed advisable to entrust the charging of tyres with Miraculum to those not acquainted with the methods involved.

CASES UNDER THE MOTOR CAR ACT.

HEAVY HAULS.

Thirteen drivers of motor-cars were fined on the 31st ult. at Oswestry, and the licence of a Birmingham motorist was suspended for six months. Fines of £5 each were inflicted on three drivers at Kingston for driving to the public danger, and other fines, varying from £3 to £10, were imposed on five motorists, one of whom has had his licence suspended for three months—all on the same day. Five motorists were summoned on a recent day at Guildford. One was ordered to pay the costs of the summons, the others were fined. Fines of £5 are being imposed on motorists at Kingston. Eleven motorists were fined £5 each at Doncaster on Saturday. Ten owners have been fined £100 at Grantham for exceeding the legal limit on the Great North Road.

CUMULATIVE PENALTIES.

Henry Blackburn, motor-car driver, Davis Road, Acton, was fined on the 31st £25 and 5 gs. costs, or three months' imprisonment with hard labour, at West London Police Court, for driving a motor-car in a dangerous manner at Notting Hill. William Rolfe was knocked down and injured. Defendant had previously been fined £20 and had his licence suspended for a year.

A LEGAL POINT OF INTEREST.

At the Falkirk Sheriff Court, before Sheriff Dean Leslie, Walter Alexander was charged with having driven a motor-bicycle, which was a motor-car within the meaning of the Motor Car Act, without having a licence for the purpose. An agent, on behalf of the respondent, raised several objections to the relevancy of the complaint, the chief of these being that there was no averment in the complaint that the Motor Car Act was still in force, notwithstanding section 21 of the Act, which stated that the Act would continue in force until December 31st, 1906, and no longer, unless Parliament determined otherwise. The Act founded upon distinctly stated that it would expire on December 31st, 1906, unless Parliament determined otherwise, and he was bound to assume from the complaint before him that the Act was not in force. The prosecutor pointed out that the Motor Car Act had been continued in force until December 31st, 1907, and he held he was not bound to quote the Continuation Act. Sheriff Dean Leslie said he thought he must hold that the Continuation Act should have been quoted. He thought it was very much in the same position as in the case where regulations framed by the Board of Trade had to be confirmed, and he thought it should have been stated that the Act was in force. His lordship accordingly dismissed the complaint as irrelevant.

EXCEEDING THE SPEED LIMIT.

At the Arundel County Bench, on Monday, three cases against motorists for exceeding the limit were heard. In one Gilbert Smith, of Bowes Park, N., pleaded guilty to driving a motor-car on the London road in the parish of Houghton, at a speed of 28 miles 220 yards per hour on October 6th.—Police officers from Guildford and Lewes were called to speak to previous convictions.—The Chairman said the defendant would have to pay the costs, £3 2s. 3d., and as that was his third conviction, three times the usual fine would be imposed, viz., £13 10s.—in all £16 12s. 3d.—Defendant asked for time to pay, but the Chairman said they never allowed time. In default of distress defendant would have to go to prison for six weeks.—Defendant said he could telegraph for the money, and he was eventually accompanied to the telegraph office by a police officer for that purpose.

THE ORGANISATION OF MOTOR-CYCLISTS.

THE Motor Union has just issued a statement showing how the revenue which it derives from motor-cyclists is expended. From this it appears that during the present year affiliation fees and subscriptions from motor-cyclists amount to £235. The expenditure on behalf of this section of the motor world and on objects for the benefit of motor-cyclists is as follows:—Legal information and advice, £75; fighting test cases, £25; grants for defence of motor-cyclists, £35; Parliamentary expenses, £30; highways protection work, £25; organisation, £60; speed limit enquiries, £7; Automobile Handbook, £25; affiliation fees paid to the Auto-Cycle Club, £33; making a total of £315. The difference between income and expenditure is to be defrayed out of the subscriptions received from car owners.

As the result of repeated representations to the committee of the Automobile Association from influential motor-cycling quarters, it has been decided to admit motor-cyclists to the privileges afforded by the A.A. on the road at a fee of 10s. 6d., which will entitle them to these privileges until the end of the next financial year, namely, April 30th, 1908. A badge has been prepared exactly similar to the A.A. car badge, but smaller, and with a special adjustment for fixing to the handle bar of a motor-cycle. As this scheme is largely in the nature of an experiment, in view of the extremely small subscription in comparison with the advantages and privileges afforded, the committee are appealing to motor-cyclists for their support and assistance, in order that the scheme may be sufficiently successful to justify its continuation after April 30th, 1908.

AWARDS IN THE COMMERCIAL VEHICLE TRIALS*

THE judges appointed by the Royal A.C. in connection with the commercial vehicle trials recommend that the following awards be made:—

CLASS A, No. 2, De Dion Box Van, silver medal; No. 6, "Unic Van," gold medal.

CLASS B, Nos. 9 and 12, two Box Vans, manufactured by the Albion Company, and entered by the Lacre Motor Car Co., Ltd., gold medal.

CLASS C, No. 13, Halley Van, silver medal, and prize given by Mr. Worby Beaumont for simplicity and freedom from liability to disarrangement, &c.; No. 19, Thornycroft Lorry with rim sides, gold medal.

CLASS D, No. 20, Halley Platform Lorry, gold medal; No. 24, Milnes-Daimler Lorry, with canopy over driver, gold medal; No. 26, Dennis Covered Van, with canopy over driver, silver medal.

CLASS E, No. 30, "Hallford" Lorry, gold medal and diploma; No. 38, De Dion Lorry, with canvas tilt, prize offered by Commercial Motor Users' Association, for cleanliness in connection with the dripping of oil; No. 40, Maudslay miller's Dray, gold medal.

CLASS E, No. 43, "Commercial Cars" Lorry with detachable sides and tailboard, silver medal; No. 45, Thornycroft Lorry with rim sides, silver medal.

During Tuesday and Wednesday of last week a Standard 16-20-h.p. four-cylinder West-Aster Motor-Car underwent a continuous Non-stop Engine Traffic Test under the observation of the R.A.C., successfully accomplishing the feat of running 48 hours without a single engine stop in the dense London traffic. The above illustration shows Mr. P. Lamb at the wheel of the car at the commencement of the Trial.

CLASS F, No. 50, Savage Platform Lorry, gold medal; No. 53 "Yorkshire" Lorry, with flat wooden body, gold medal.

CLASS H, No. 58, "Burrell" Steam Tractor, gold medal; No. 59, "Wellington" Compound Steam Tractor, silver medal.

The judges further recommend that a silver medal be awarded to F. Mills, the driver of E 35, for resourcefulness in bringing his vehicle into Leeds under difficult circumstances, and that a silver medal be awarded to Charles Downs, driver of H 60, for bringing his vehicle into Bristol after a serious accident.

In connection with the punctuality of drivers, the judges further recommend the award of £5 and silver medals to each of the following:—F. Shaw (C 14), M. L. Livings (C 15), E. D. Alexander (C 18), B. Turner (E 40), H. Wand (F 52), J. Kay (F 53), H. Clarke and H. Parlett (H 58), Charles Smith (H 59), Charles Downs (H 60).

The Army Council has decided to grant two diplomas as follows:—CLASS C, No. 19, a Thornycroft lorry capable of carrying 30 cwt., on account of the successful use of petroleum fuel in a four-cylinder internal combustion engine, as it is considered that an engine of this description is most suitable for army use.

CLASS E, No. 40, a Maudslay lorry capable of carrying three tons, on account of the accessibility of the working parts of the engine, which is a very valuable feature from a military point of view.

WITH A MOTOR-CAR THROUGH SOMALILAND.

SOME interesting and exciting details have just come to hand of the trip undertaken by the adventurous young Englishman Mr. B. J. F. Bentley, who, in company with Mr. Wells, left Djibuti in August on an 18-h.p. Siddeley motor-car with a view to crossing Abyssinia and journeying by the Nile Valley to Khartoum. For many miles there is no road, and the travellers spent days on end doing nothing but cutting away bush and removing or breaking up heavy stones to make a passage for the car before they reached Dire Doua.

On their way they encountered considerable danger. "Both in British and French Somaliland, and also in Abyssinia," writes Mr. Bentley, "my trip has been looked upon as nothing short of madness. The Governor of French Somaliland gave me, on leaving, a document disclaiming responsibility for our safety if we proceeded into the interior otherwise than by railway. The only precaution I took was to buy two more rifles for my two boys, and 200 rounds of additional ammunition. From Zeila the British consul gave me an escort of the Camel Corps as far as Hansa, and we had left this place only thirty miles behind us when I began to smell trouble. From the reports we got from the native runners going through, it looked as if we were in for a warm time from the Esa tribe.

"At Lascelle I stopped for water and bought a sheep from a shepherd. We were busy cooking it when a Government boy going through warned us that there were some 400 Esas waiting for us in the bush 15 miles further on. They seemed quite determined to stop us making a railway (as they called it) through their country. An hour later I could see with the aid of my glasses numbers of moving objects in the bush, and the sun shining on their spears gave me no further room for doubt. We decided to move on and take no heed of them, but they waited. They were an ugly looking lot, all fully armed. They demanded 'backsheesh' from us for taking the car through their country. I managed to get the head man aside, and reluctantly parted with £3, and told him to proceed to Gildessa with his followers, and on my arrival there I would deal generously with them; but I quite forgot to mention to him that I was going to Lascarat instead of Gildessa, although the Gildessa route was the better of the two. The result was that while they were waiting for me at Gildessa I slipped through to Addogalla via Lascarat. But bad luck was in store for us. There is a little shanty at Addogalla called an 'hotel,' at which we stayed for a meal. The Abyssinian governor provided a guard for our car while we were feeding. Suddenly there was a tremendous row outside. Wells, myself, and several other Europeans clapped on our helmets and rushed outside to see the cause of the trouble. The car was hidden by a howling mob of some 800 Esas. We slipped back for our rifles, and on our return all the Abyssinian troops had turned out with their rifles loaded. The Abyssinian chief explained that while his men were guarding the car some Esas came up and demanded 'backsheesh.' He told one man who seemed to be the spokesman to 'move on,' which he promptly refused to do. Whereupon the Abyssinian tapped the Esa over the head with his rifle and carted him off in a senseless condition to the police station. The news soon spread to the Esa village, and some 800 of them turned out and surrounded the car and threatened to smash it up. Things were looking very serious for us. The eight Europeans produced their rifles, and there were Wells, myself, and two boys, all well armed, as well as twenty-seven Abyssinian troops. So altogether we numbered thirty-nine well-armed men. We took up our positions behind the wall of the police compound and waited events. Suddenly the Esas cleared off into the bush. Taking advantage of their absence we ran the car into the police compound. Shortly after a few of them returned and gave us the pleasing news that they would wait for us in the bush country.

"It was four o'clock, and I decided to 'phone through to the British Consul at Dire Doua for assistance. An hour later I received a message that the Governor of Dire Doua was sending troops to our assistance, and that we were to remain fast until they came. The following morning the troops arrived, and at 6.30 we moved off with the escort of twenty-five men. At Elba we left the troops, and, after difficulties too numerous to mention, with some rivers and heavy timber, we arrived at Dire Doua. From all over the country we have been receiving telephonic congratulations, even from Emperor Menelik himself. Our getting here is looked upon as nothing less than marvellous. The car is the first vehicle of any description that has ever crossed Somaliland."

OBSTRUCTING A MOTORIST.

At Tunbridge Wells County Bench, a Southborough man was charged with wilfully obstructing the highway near Pembury, to the danger of traffic. Mr. Schlenkhamer deposed that he lived at Pembury, and in August last he was travelling in his motor-car on the Romford road, when he found a van in the way. Witness had to stop his car. The driver of the van was in a house, and when he came out he used strong language, saying he was not going to move his van for a motor-car. The horse and van were left unattended in the road, and witness told the man he would summon him, but defendant only swore at witness. Defendant was fined 2s. 6d. and 11s. costs.

AUTOMOBILE ACCIDENTS.

A COLLISION between a motor-car belonging to the Craven Automobile Company, Skipton, and a three-horse wagonette belonging to Mr. Kendall Chew, also of Skipton, has taken place. The car was being driven to the railway station, and Mr. Chew's vehicle, which was conveying mill operatives from Skipton to their homes at Embay, was proceeding in the direction of the town. The motor-car collided with the horses, and they sustained such injury that two of them had to be destroyed. The motor-car was badly damaged, but the passengers escaped without injury.

SHORTLY after 9.30 p.m. one night last week an accident occurred at Whaplode (Lincolnshire). A motor-car belonging to Mr. L. C. Harvey, of Spalding, and containing Mr. Harvey, his driver, and three ladies, was proceeding from Sutton Bridge to Spalding. The night was dark, and when passing through Whaplode the occupants of the car saw lying across the middle of the road in front of them what they took to be a log of wood. Apparently the object was not seen until the car was too close to avoid it altogether, and the chauffeur—who states that he feared if he passed over one end of what he thought to be the log the other end would spring up and possibly damage the car or injure the occupants—went straight ahead, and passed over it. Both Mr. Harvey and his chauffeur state that the latter, who was driving, was slowing down with the object of going back and removing the obstruction, when they saw a motor-cyclist, bound in the opposite direction, just about to mount his machine. They accordingly shouted a warning to this man, and continued their journey, leaving him to clear away the supposed log of wood. Mr. Harvey and party continued their journey, and on arriving at Spalding passed Police Inspector Cook, to whom he reported that a log of wood had been placed across the road at Whaplode, and asked him to make enquiries, complaining that he had encountered similar obstructions previously. It was not until the following morning that the motorists learned that what they took for a log of wood was a human being. At the inquest the coroner entered a verdict to the following effect:—"That Harry Fortune died from injuries received from being run over by a motor-car, and that the jury were of opinion that the owner of the car, Mr. Harvey, should have pulled up, having run over an obstacle which proved to be the deceased man." The coroner added that he put it in that manner, to show Mr. Harvey was not aware what the obstacle was. The jury agreed with this form of verdict.

A SCOTISH APPEAL.

The First Division of the Court of Session, the Lord President, Lord Dunedin, Lord Kinnear and Lord Dundas on the Bench, heard the appeal in the case of Macfarlane v. Colam on Friday of last week. This was an appeal from the decision of the Sheriff of Inverness-shire in an action at the instance of a carriage hirer against a motor-car owner for damages alleged to have been caused to a carriage and horses belonging to the former, caused by the presence of a motor-car at the side of the road with the engine stopped, near Kingussie, Inverness-shire, where Mr. Colam, the owner of the car, is a summer resident. No fault was proved against the motorist except that, in the opinion of the Sheriff of Inverness, he was in breach of the statute in leaving a motor-car unattended, the provision founded on being Section 96 of the General Turnpike Act of 1831. He mulcted Mr. Colam in £38.

The First Division on the 1st inst. sustained the appeal and recalled the interlocutor of the Sheriff Substitute and found in fact:—(1) That the leaving of the car in the position described did not constitute an obstruction to the highway. (2) That leaving the car for the time without a person in attendance had no relation to the accident. (3) That the same happened through the shying of the horses and the inability of the driver to control them.

Mr. Colam is a member of the Scottish Automobile Club, and the Club contributed towards his costs both in the Sheriff Court and in the Court of Session.

"CARRIAGES" ARE "MOTOR-CARS."

IN the Court of Sessions at Edinburgh a question of the intention of the testator, the late John Denholm, The Mains, Eastwood, Renfrewshire, in the fourth purpose of his will, dated in 1890, has been raised. By that purpose he bequeathed to his widow his "furniture and plenishing, including books, plate, pictures, jewellery, ornaments, and bed and table linen, and also horses and carriages, live stock, plants, and garden and stable implements." Mr. Denholm left estate amounting to £53,000. For many years he kept a brongham and a wagonette, and one carriage horse, but at the time of his death in 1907 he had no horses and carriages, but he had two motor-cars. A question arose as to whether the bequest to Mrs. Denholm carried the motor-cars to her, or whether they formed part of the residue of the trust estate.

The Court held that Mrs. Denholm was entitled to the motor-cars in virtue of the bequest in her favour. The Lord President said he thought one was entitled to construe the word "carriages" in the will of the testator in the light of what the testator himself did. His life showed that he had come to consider as his carriages these motor-cars. The word carriage itself was certainly wide enough to cover any form of vehicle in which one was carried; and the testator allowed his will to remain unaltered knowing that he had actually replaced his horse carriages by motor carriages.

COMPANY NEWS.

THAMES BANK WHARF MOTOR WORKS.—£75,000. To acquire the business carried on at Thames Bank Wharf as E. Henry Jones and Co., and to carry on the business of motor-car and vehicle manufacturers, &c. 112, Grosvenor Road, S.W.

ROSSLEIGH, LTD.—The report of the directors of Rossleigh, Ltd., presented to the meeting held at Edinburgh on Thursday, showed a trading profit during the year ending September 30th last of £5,274, which, after depreciation, &c., gave a net profit of £4,417. This, with the amount carried forward from last year, has enabled the directors to recommend the payment of a dividend at a rate of 6 per cent. on the preference shares and of 15 per cent. on the ordinary shares, and carry forward a sum of about £6,000.

DUNLOP RUBBER COMPANY.—The annual meeting of the Dunlop Rubber Company was held in London on Monday, Mr. Harvey du Cros, M.P., presiding. He said the company was in a very strong and satisfactory position. Its capital was £220,000. The assets were worth £1,000,029, and the liabilities, other than capital, were £82,500, and after deducting the capital there was an excess of £605,000 over every possible liability. He gave statistics showing that the loss for the first year was £724, since when the profits had gradually risen until last year they amounted to £490,527. The total earnings during the nine years were £1,174,099. Having explained the relations between the company and the Dunlop Tyre Company, the chairman dealt with the conditions of the motor trade. There was almost sure, he said, to come a depression in the 'bus motor trade, but it was not correct to say there was anything like a crisis. There was, however, a revolution going on in the trade. It was a great mistake to suppose that there was less demand for motors than formerly. On the contrary, it was increasing. It was larger this year than it had ever been, but the question of the future was one of capital. He prophesied that the small makers would eventually be absorbed by the larger. The report, recommending a dividend of 100 per cent., was adopted.

DENNIS BROTHERS.—The eighth annual report of Dennis Brothers, Ltd., of Guildford, is just out, showing exceptionally good results. The directors recommend paying the usual dividend of 12½ per cent., and carrying forward to the reserve fund the sum of £12,000. This after paying off the amount standing to the goodwill of the company, and also starting an extra building depreciation fund with £2,000.

ROVER COMPANY.—The annual meeting of the Rover Company was held on Tuesday at Coventry, Sir F. Dixon-Hartland, M.P., presiding. In proposing the adoption of the report and the payment of a dividend of 10 per cent. the chairman said the past year had been a very successful one. The Rover Company had been able to increase its earnings, and he ascribed this to the company having taken up the business of motor making. He reminded the meeting that the cost of removing to new works had all been paid out of capital, and called attention to £30,000 goodwill having been written off. Mr. H. Smith (managing director) seconded, and the report was adopted. An extraordinary meeting was afterwards held, when a resolution was adopted for the creation of £50,000 new capital.

A QUESTION OF HIRE.

How long the hirer of a motor-car is to be expected to wait during breakdowns was the interesting point raised at the hearing of an action in the Clerkenwell Court, on Monday. The Park Motor Company, of Tottenham Court Road, sued for £4 10s. for hire of a car.

Mr. Brooks, of Canonbury, the defendant, explained the circumstances of his Easter Monday outing. The journey was to be to St. Albans. Within two miles of St. Albans the tyre punctured, and there was a stop of about forty-five minutes. On the way home, near Watford, another puncture occurred. The six occupants waited in the town two or three hours, and then, the car not being repaired, they decided to return by train. At that moment a car arrived to hold three persons, but they had then taken their tickets.

Mr. Jacobs, solicitor for plaintiffs, said a telephone order was given for a car for three or four people and, it might be, two children. The car was despatched, and six adults entered it for the journey. The first puncture was attended to by the chauffeur. Unfortunately, it being Bank Holiday, there was no place where men were available to repair the second mishap. The defendant counterclaimed for 18s. 2d., representing the cost of railway fares and telephone messages. Evidence was given that on receiving a telephone message the plaintiffs promptly despatched another car, with a spare cover and tube.

Mr. White, for the defendant, submitted that the plaintiffs could not recover. The party was to be taken out and brought back again. They could not be expected to wait for an indefinite time after a breakdown.

The judge said the misfortune did not happen through any fault on plaintiffs' part. The chauffeur did all he could under the circumstances, and had the party waited long enough they could have returned to London by motor-car. The verdict would be for the plaintiffs on the claim and counterclaim.

In view of the great success of the Standard six-cylinder car, Mr. Charles Friswell, chairman of the Standard Motor Company, Ltd., is leaving England on December 6th for India, in order to thoroughly establish the "Standard" business in that country.

PUBLIC MOTOR SERVICES.

TRADESMEN in the Western Road, Brighton, which is the principal route of the motor-buses, are petitioning the local authorities to obtain relief from the alleged annoyance caused by these vehicles.

THE London Cab-Owners' Federation are petitioning the Home Secretary with a view to the introduction of the taximeter in horse-drawn cabs, with a minimum fare of sixpence. The comparative times and fare for a motor-taxicab, a horse-drawn taxicab, and an ordinary hansom for a distance up to three miles are as follows:—

	Motor Taxicab.		Horsed Taxicab.		Ordinary Hansom To-day.
1 mile ...	4 min., 8d.	...	6 min., 6d.	—	6 min., 1s. 0d.
2 miles ...	8 min., 1s. 4d.	...	12 min., 1s. 0d.	—	12 min., 1s. 0d.

The saving is in time on the motor-taxicab and in money on the horsed variety.

DURING the ensuing session of Parliament a bill is to be promoted by the Wides Town Council authorising the running and working of motor-omnibuses by the Corporation.

A PUBLIC meeting at Herne Hill has passed a resolution protesting against the use of the Dulwich road and neighbourhood as a route for motor-buses.

THE receipts from the Eastbourne motor-omnibuses for the week ended the 2nd inst. were £144 17s. 1d., and the total number of passengers carried 26,791.

The 40-h.p. Six-Cylinder Napier Landulet recently supplied to Mr. J. Coleman, of Gatton Park, Surrey.

CLAIM AGAINST MOTORIST.

In the Civil Court at the Manchester Assizes, before Mr. Justice Pickford, William Nuthall, of Levenshulme, claimed damages for having been run into and injured by a motor-bronham belonging to Mr. H. N. Bickerton, of Marple, on May 10th, at Denton. In his summing-up the judge said that whilst drivers of motor-cars were bound to be careful there was some obligation also resting on foot passengers. Many persons did not like motor-cars; but they were here, they had come to stay, and the public had to accept it. These vehicles had become such common objects that people crossing highways ought to be on the look out. In ordinary circumstances he should think the jury would have little hesitation in saying that a person stepping suddenly in front of a vehicle which was admittedly running at a speed of not more than four or five miles an hour, without looking, was guilty of carelessness. It was a question for the jury whether the accident was contributed to by any negligence on the part of the chauffeur in not blowing his horn when passing the tramcar. The jury, after a short deliberation, said they were of opinion that there had been negligence on both sides, and judgment was entered for the defendant.

SOME attractive cards have been issued showing the record of successes on "Shell" spirit during the past season.

THE old-established coach-building business of Mr. Frank Allen at 27-29, Long Acre, London, W.C., has been absorbed by the Connaught Motor and Carriage Company, at the head of which is Mr. S. C. Godfrey, late manager of the Victoria Carriage Company. In addition to carrying on the body building part of the business and agencies for Renault and Siddeley cars, the new concern has secured the sole agency for the N.A.G. cars, built by the Neue Automobile Gesellschaft, of Berlin.

FORTHCOMING EVENTS.

NOVEMBER.

- 8th (F.).—Society of Motor Manufacturers and Traders' Dinner, Grand Hotel, Charing Cross. Mr. E. Manville in the chair.
 11th-23rd.—Olympia Motor-Car Exhibition.
 12th-30th.—Paris Motor Show.
 13th (W.).—Annual Dinner of the Motor Union at the Hotel Great Central, London.
 15th.—The "Industrial Motor Review" for November will be published.
 20th (W.).—Institute of Automobile Engineers. Address by Col. R. E. Crompton.
 22nd-30th.—Stanley Show.
 23rd.—The third Olympia Show number of the *Motor-Car Journal* will be issued.
 30th (S.).—Annual Dinner of the North London A.C. at the Midland Grand Hotel, London.

DECEMBER.

- 2nd (M.).—Cheshire A.C. annual dinner.
 4th (W.).—Southend and District M.C. annual dinner.
 5th (Th.).—Exhibition at Berlin.
 7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.
 Annual dinner of the Hertfordshire C.A.C.
 18th (M.).—General Committee of the Motor Union.
 21st (S.).—Opening of the Brussels Exhibition.
 26th (Th.).—Annual Reliability Trial of the Motor Union of Western India.

JANUARY, 1908.

- 4th-11th.—Dublin Motor Show.

FEBRUARY.

- 7th-15th.—Manchester Motor Show at Belle Vue.

MARCH.

- 21st-23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

CLAIM BY A MOTORIST.

IN a case just heard at the Salford County Court, the plaintiff was Ernest Jones, of Urmston, and the defendants were Thomas Ogden and John Jones, of Urmston. It was stated that the defendant Jones, requiring a horse and driver in addition to his own, in order to remove some furniture from Urmston to Knutsford, hired a horse from the defendant Ogden and also Ogden's servant, a man named Haddock. On April 24 last, plaintiff was driving his motor-car in Urmston Lane, when he saw Jones's van with the two horses approaching him with no man in attendance. He slowed down and shouted, but there was no response and the van caught the motor-car, carried away the dashboard, and did other damage. Then the defendant Jones and the man Haddock, who it was stated had been lagging behind, came up, and Haddock, who arrived first, apologised for not being in charge of the horses. Mr. McKeever said the facts had made it clear that he should not ask for a verdict as against Jones, and his Honour gave judgment for plaintiff as against Ogden for the amount claimed—£9—and for the defendant with costs in the case of J. R. Jones. Plaintiff was also given costs against Ogden.

POLICE TRAPS.

NEAR Whinney Lane, on the London Road, at Retford, is a police "control."

A MEASURED distance of 1,100 yards is worked by the police between the toll gate and the cemetery at Alnwick.

MOTORISTS travelling on the Epsom-Leatherhead road should be wary when approaching the former place.

IN the parish of Walberton, on the Chichester road, the police have a measured distance.

AT Skellow and also at Rossington are police traps leading to the West Riding Police Court at Doncaster.

A TRAP is being frequently worked between the Nag's Head and Whinney Lane at Retford.

THERE is a police trap at Ball's Hut, near Arundel, on the hill both ways.

OWING to the extension of the business of the Motor Accessories Company, of 55, Gt. Marlborough Street, W., it has been found necessary by the proprietor, Mr. W. J. Shaw, to take into partnership his brother, Mr. H. E. Shaw, who has a wide experience in motors and accessories.

A SPARKING PLUG'S SOLILOQUY.

So very simple and useful is my construction and purpose, and so seldom am I productive of trouble, considering the severity of the work which is thrown upon me, that the average motorist gives, I am afraid, small thought to the matter of my construction once I am screwed into the cylinder and connected to the coil. Nevertheless in proportion to my size there can be small doubt that I embody more exacting conformity to close and contradictory requirements than any other portion of that curiously perplexing device, the internal combustion motor. First of all, I must be a plug in the absolute sense of the word, capable of resisting high temperatures and high pressures and remaining gas tight throughout all ranges of both and with a liberal allowance for unusual conditions. Second, I must form a perfect insulation for the current, throughout the same conditions, and regardless of the presence of my enemies, oil or soot. Third, I must spark whenever the current is passed through me, which is to say that I must show no tendency to accumulate foreign matter on my sparking points, to become short-circuited for this or any other reason, and that my sparking action must be available not alone throughout a wide range of temperature and pressure conditions, but also throughout the widest possible range of electrical pressures, thus reducing the necessity of frequent adjustment of my friends the contact breaker or trembler. The insulating materials available for my formation, that is to say, those which are capable of resisting the effects of heat, are, I am sorry to say, either brittle, hard to work, or possess properties of expansion under heat so different from those of the metals used in my body as to render me useful only under standard conditions of temperature, unless special provisions are made. All things considered, it is rather more to be wondered at that I last as long as I do than that I fail occasionally under strenuous conditions of servitude.

BUSINESS NEWS.

MR. H. WAYMOUTH PRANCE, A.I.E.E., is open to advise visitors to the Olympia Exhibition with regard to motor-cars generally.

MESSRS. H. M. HOBSON, LTD., have decided to extend the guarantee of the Pognon plug from six months to twelve months.

THE DAIMLER MOTOR COMPANY announce that they have established a depot at No. 3, Plaza Celenque, Calle Arenal, Madrid, where models of the latest Daimler car as well as a stock of spare parts will be kept.

THE Gripwell Tread of the Roberts Non-Skid Motor Tyre Tread Manufacturing Company, of St. Mary's Row, Birmingham, is a tread in which the studs are built up into the canvas and rubber foundation, which is then vulcanised to the cover in the ordinary way, just as a plain round tread. This has been before motorists for months, and no complaint has yet been received by the makers—a fact which speaks highly for its general good quality. The company's detachable bands are proving popular, whilst the "Fixquick" Band is showing equally satisfactory. The Roberts Automatic Tyre Tester is simple in manipulation and a good means to economy in connection with tyres.

THE working parts of the Hotchkiss car which recently completed a 15,000 miles tour in Great Britain and Ireland, under the observation of the Royal A.C., will be on view at the stand of the London and Parisian motor Company, Ltd., at Olympia.

ALTHOUGH they applied for 800 ft. of floor space at Olympia, the British Petroleum Company, Ltd., have to be content with 135 ft. They are trusting, however, to be able to find room there to make clear the merits of both "Shell" spirit and their 760 heavy spirit.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-28, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, NOVEMBER 16, 1907.

[No. 454.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

most fitting way of dealing with the matter until some months after, when the East Sussex County Council secured an Inquiry to secure a limitation of speed. This has now been granted, and the order will shortly be issued from Whitehall. What a chance for the police!

The Future Demand.

At many of the meetings of motor companies recently the chairmen, in moving the adoption of the reports, have referred to some of the tendencies existing in the automobile industry, and have generally confirmed the opinions expressed in these columns with regard to the present position and the outlook for the future. Last week Mr. W. L. Sleigh, the chairman of Rossleigh, Ltd., the well-known Scottish motor agency, spoke at the meeting of that company and mentioned the fact that buyers of big cars at high prices were not very numerous at the moment. At the present time, when the mechanically-propelled vehicle was carrying all before it, and every year becoming less a luxury and more a necessity, it was satisfactory to see manufacturers trying to reduce costs. The consensus of opinion seemed to be that the principal trade would centre around a moderate-priced car about £300 to £400, and of about 16-h.p. to 20-h.p. There would, of course, always be the *modele de luxe* car, the car of the wealthy, from £1,000 up, and there would, in the opinion of Mr. Sleigh, be a certain demand for a small runabout car.

The Last of the Tourist Trophy.

THERE will be no Tourist Trophy Race in the Isle of Man next year on a fuel consumption basis, as the Royal A.C. has come to the conclusion that manufacturers are now in possession of all the data which can be useful to them as obtained from races in which the amount of fuel allowed is limited. The fixing of a definite allowance of fuel for a given distance afforded an easy means of limiting the engine-power and consequently the speed of the competing cars. The Tourist

Trophy Race was always a test with the one object of evolving the most efficient and most economical form of touring car of the moderate horse-power required by the ordinary user, and the conditions left a great deal to the ingenuity of the manufacturer, inducing him to experiment in various ways with the object of improving his own particular productions, since the race was not confined to existing standard types. The purpose of the race has apparently been fulfilled, and the Competitions Committee of the Royal A.C. has therefore been considering for some time past the practicability of holding a race in the Isle of Man, which will give considerable scope to the manufacturers, and at the same time compare favourably with any of the Continental races from the sporting point of view. The proposition put forward is that if the sanction of the Island authorities can be obtained a speed race of about 350 miles shall be held there, the race to be based on maximum bore and minimum weight. Cars will be eligible the D²n of whose cylinders does not exceed sixty-four (D representing the diameter of the cylinders and N the number), and which, in the case of internal combustion engines, shall not have less than four working cylinders. The minimum weight will be 1,800 lbs., which shall exclude driver, mechanic, spare parts, spare tyres, tools, but shall include petrol, oil and water.

The Touring Car Defined.

IN June of the present year a sub-committee of the Society of Motor Manufacturers and Traders was appointed to consider the holding of the International Motor Contest of Great Britain next year, and also to secure the definition of a touring car for competition. This has met several times, and the members have now agreed that cars should be divided for the purpose of competitions into a number of classes in accordance with the R.A.C. rating, and that there should be fixed in connection with each class—(a) A minimum total weight including passengers; (b) a minimum surface presented to wind resistance; (c) a minimum resistance area for wings; (d) a minimum distance between the dashboard and back axle; (e) that every car should carry four passengers, except smaller cars, which should be required to carry only two passengers. In order to arrive at the proper weights and measurements in connection with each category, Mr. G. A. Burls tabulated information concerning 243 cars on the market, and upon the results of his inquiry conclusions were come to which form the basis on which the table on page 817 was based. This has now been adopted by the Expert Committee of the Royal A.C., and it is hoped that the definition will be accepted by all motor clubs throughout the United Kingdom in connection with their competitions next year.

The 1908 Event.

FOLLOWING this acceptance of a definition for touring cars comes an announcement of the decision of the Society of Motor Manufacturers with regard to the multiplicity of competitions in which makers are invited to participate. They consider that these have become a tax upon the trade out of all proportion to the benefits obtained, and that next year the Royal A.C. should organise one great event only. Having considered many suggestions as to the form of the Trial, as well as to the system of classification, the committee of the society have decided in favour of classification by cylinder dimension. They are recommending that next year there should be held an International Motor Contest to be organised by a joint committee of the Royal A.A. and the Society of Motor Manufacturers. These they suggest should consist of (a) 2,000 miles reliability trial on the road starting from and returning to London, (b) twenty miles of timed hill climbs to be included in the long distance, and the trial to terminate with (c) a 200 miles race on the Brooklands Track. The records are to be time records throughout, and will consist of time lost (a) on the road, (b) in climbing the hills, (c) in the race on the track, and (d) in filling petrol tanks. The latter record is to be based on the idea that a minute is lost in respect to every gallon filled into the petrol tank of a car throughout the contest. Tyre delays will be duly counted. Detachable wheels and rims will, however,

The above illustration depicts the Star 30-h.p. Six-Cylinder Car, placed by Mr. H. C. Hull, the Colonial Treasurer, at the disposal of the Crown Prince of Portugal during his recent stay in Pretoria. His Royal Highness is seated at the side of the driver, while at the rear is Lord Selborne.

be permitted. It is to be noted that such qualities as silence, flexibility, absence of vibration, &c., which the prospective motorist can judge in the course of a short trial run on his own account, will be ignored in connection with the trial now proposed.

Try, Try, Try Again.

THE old story of Bruce and the spider was illustrated when an unsuccessful attempt on the hour and 100 miles records was made on Friday at Brooklands by Mr. J. E. Hutton on a 120-h.p. Mercedes. Mr. Hutton started at noon, but on reaching the fork on the first lap his petrol pipe broke and he was compelled to make a later start to allow of the defective part being mended. Another start was effected, but the timing apparatus was not ready, and it was with difficulty that Mr. Hutton was brought to a halt. About a dozen people with flags waved for him to stop at the fork, but Mr. Hutton's mind was centred wholly on his car, and it was not until he had passed for the third time that his attention was attracted by the flags. At 2.30 yet another start was made, and it appeared as

if he would have no difficulty in creating new records. The first four laps were covered at about 90 miles an hour, and the engine appeared to be running very smoothly, but in the fifth lap a water joint broke, and he had to abandon all hope of making any further attempt for the day. But Mr. Hutton will try again.

Motor Scholarships.

PERHAPS one of the most important announcements at the dinner of the Daimler Motor Company on Saturday—if we except the intimation that the King has ordered the new badge of the R.A.C. illustrated in our issue of September 7th to be affixed to all Royal motor-cars—was the announcement by Mr. E. Manville that the company had decided to offer a number of scholarships tenable at their works. The directors propose to offer these scholarships to successful candidates in an engineering examination in July next. There will be one major and four minor awards, the holders to be entitled to a two years' course in the Daimler shops at Coventry, together with instruction and supervision in the theoretical side of automobile engineering. In addition the holder of the major scholarship will receive £100 per annum for the two years he passes in the works, while the winners of the minor scholarships will receive £20 yearly during the same period. In order that the Company shall not lose the services of those whom they thus train, the holders of the scholarships must agree to work with the Company for a further two years, at a salary of not less than £150 per annum, if their services be desired. Professor Silvanus Thompson and Dr. Hele-Shaw are associated with the directors in the development of the scheme, which is interesting as pioneering the way for systematic instruction in the motor workshops of this country.

Automobile Instruction.

IN thus initiating a new policy the Daimler Company are to be congratulated. Our columns have recently testified to the universal interest that attaches to instruction in motor-car work, and at most of the polytechnics throughout the country courses of study are being arranged, but it is the first occasion that a private concern has thus boldly gone forward, not only in finding an opening for intellectual young engineers, but in devising a plan of utilising their services when that is complete. One of the most notable features of the development of Motorism has been the presence of so many young men in the business as well as in the shops. Circumstances have conspired to give the industry an influx of young and enterprising fellows, and their learning on right lines is one of the most hopeful signs that the British section of the industry will maintain a proud position in the world's automobile business—not only on the commercial but also on the technical side.

Level Railway Crossings.

THOSE who have motored on the Continent have been painfully aware of the dangers that lurk in the level crossings on the main roads. They are met with more frequently in some parts of France than here, but even in England they are a sufficient feature of the landscape to warrant inquiry by the Motor Union. The Union is instituting this investigation with a view of subsequently approaching the Board of Trade on the matter, and meanwhile information on about eight important matters is required by the organisation with a view of laying a detailed and accurate report concerning these crossings before the Board of Trade. Motorists throughout the country can assist this movement by sending any information they may possess to Mr. Rees Jeffreys, who specially desires information on the following points:—(1) Actual length of time gates are closed for the purpose of allowing trains to pass; (2) number of trains passing per day; (3) condition of roadway over crossing; (4) whether crossing is as wide as road on either side of it; (5) whether portions of trains are

allowed to stand on crossings adjoining stations owing to insufficient platform; (6) whether any shunting is done over the crossing; (7) particulars of any accidents caused by the level crossing; and (8) whether crossings are sufficiently lighted at night.

The Western India Trials.

It is expected that the entries for the forthcoming Reliability Trials of the Motor Union of Western India will constitute a record for the Dependency. The event is arousing considerable interest at Bombay, Calcutta, and Madras, while British and Continental competitors should add to the excitement. It will commence on Boxing Day, and continue to December 29th, the four stages being from Bombay to Poona, from the latter place to Kolhapur, from thence to Mahabeshwar, and return to Bombay. There will be five categories, determined by the selling prices of the vehicles in the competition. Mahabeshwar is again included in the itinerary, and there is no more charming journey than that over the beautiful red roads from Panchgani to Mahabeshwar, while the section from Satara

business, and it was not even mentioned that the latter has a high opinion of the White steam car, as have a good many people on this side of the Atlantic.

Motor-car Imports and Exports.

A FURTHER notable decline took place last month in the importation of foreign motor-cars and parts into this country. The number of complete vehicles which reached the United Kingdom during October was 368, their value being given at £153,132. Parts were responsible for an additional £196,540, which gives a total of only £349,672, as against £358,255 in the corresponding month of last year. For the first nine months of the current year the figures are:—Number of cars imported, 4,206; value of same, £1,828,356; imports of motor parts, £2,132,142; total, £3,960,498. For the similar period of 1906 they were:—5,201 cars of a value of £2,199,199; parts, £1,598,686; total, £3,797,885. Turning to the exports of British motor-cars and parts, these continue to show a steady expansion, October's total of £156,416 forming a new record. The number of vehicles shipped during the ten months ending

A General View of the Paris Salon which opened on Tuesday last.

to Kolhapur will be quite new to even those who are familiar with other sections of the route. Mr. N. M. Marshall, who is joint secretary with Capt. Hutchinson of the Motor Union of Western India, is organising the event. Plans are in progress for the camp at Kolhapur to be laid out in most attractive Indian fashion.

The White Car in Vanity Fair.

MR. F. A. COLEMAN, having been "Spy'd" in "Vanity Fair," has now reached another rung on the ladder of fame he has been climbing since he became identified with the White steam cars. Last week he entertained a company of friends and colleagues to dinner at the Ritz Hotel, and demonstrated his excellent powers as a host. The gentlemen present included Earl Russell, Earl de la Warr, the Hon. Arthur Stanley, M.P., Sir Edgar Boehm, Bart., Colonel Holden, Mr. Harvey du Cros, M.P., Mr. C. D. Rose, M.P., Mr. J. W. Hunt, Mr. Heckstall-Smith, and many other well-known men. Only two toasts were proposed, the King of England and the President of the United States. Not a word was said about

with October last was 1,881, of a value of £694,332; to this have to be added parts estimated at £397,838, which gives a combined total of £1,092,170, as contrasted with only £615,665 in the corresponding period of 1906.

Standard Threads.

A CONFERENCE has lately been held between the various organisations connected with the motor trade with regard to the new standard for fine threads adopted by the Engineering Standards Committee being applicable to the conditions of automobile construction. After some discussion, a summary of which appears on another page, there seemed to be general agreement as to the suitability of the British standard fine threads for employment in motor-car construction. Attention was also drawn to the advantage in lightening the existing Whitworth standard fine threads by reducing their width across the flats when employed in motor-car construction. The desirability of adding certain special standard threads to those already standardised by the committee was also considered.

HOW MOTOR CABBIES OBTAIN THEIR LICENCES.

I WONDER if our country cousins, or, for the matter of that, the London public, are aware of the extreme care the Metropolitan Police authorities take of them as regards their safety when travelling, especially in cabs, in the metropolis. Let me just give a brief outline of the ordeal a man has to pass through to gain a licence to drive a hackney carriage propelled by mechanical power, *i.e.*, the taxi-cab.

He must first present himself at Scotland Yard, where a form is filled up stating name, address, age, height, colour of eyes, and description of complexion. He is then presented with a book entitled, "List from which questions may be put to applicants for licences to act as hackney drivers, to test their knowledge of London." The questions, which number roughly about 1,500, consist of routes, squares, hospitals, clubs, public buildings, theatres, police and county courts, &c. Not knowing on which particular page he will be examined, the applicant must perforce commit most of the matter to memory if he desires to pass on his first application (which does not often happen). Catch questions such as "Drive me from Westminster Guildhall to Clerkenwell Sessions House," and again, "Drive me from Broad Sanctuary to North London Sessions House, both, of course, being precisely the same routes, are often put, and if he

A Snapshot in the Rue de la Paix, Paris, showing how motor-cars are now outnumbering horse-drawn vehicles.

fails to answer two out of fifty questions fired at him at railroad speed he (whether absolutely penniless or not is all one to the hard-hearted examiner) is put back for a week to pore anew over the "list from which questions, &c." Answers to all may be found, he is told, in the London Directory, but some want a "bit" of finding.

We take it he passes the "knowledge of London" test. He now receives a "requisition," which is a form he has to have filled up by his late employer and two householders in the district where he resides, to certify that he is capable, by being steady, sober, and of good character, to apply for hire with a hackney carriage propelled by mechanical power. I may add that there is a note to the effect that the applicant must appear for his licence clean and tidy, or the notice curtly tells him that he may be refused. With this requisition he joyfully hies himself to the Motor Cab Company, who, on seeing the requisition, hand him over to an instructor to be thoroughly taught the art of driving their cabs, great care being taken to test him in traffic, hill climbing, and the many police regulations. If a fairly smart man, his instructor pronounces him fit, after the necessary instruction. He is then sent to Scotland Yard with about seven others, and at 2 p.m. is taken in hand by an Inspector, first to reverse the cab through an archway, where so many men, though excellent drivers, fail through sheer nervousness. Such little details as looking backwards too often, one side to the other, or momentarily removing

both hands from the steering wheel in altering his speed lever on coming out, often fails a man, and the much-dreaded "Near side! Next man up!" proclaims that he has failed and cannot, unless petitioning the Commissioner, enter the test for another fortnight—the second failure means a month's wait. Presuming he is lucky enough to pass the reversing test, the Inspector mounts the box and the ordeal of traffic has to be gone through. A favourite route is, out of the "Yard," over Westminster Bridge, where on the other side one is apt to pass a tram on one's off side, crossing Waterloo Bridge, Strand and City. The Mansion House is a particularly tricky centre, as even a good driver might pass on the wrong side of one of the many obelisks, as the order of certain streets is not given until almost reached. Trafalgar Square and Parliament Street are other favourite traps for the novice.

The lucky ones who have passed the driving test give the applicant the friendly "wire" that hand signals more than moderate use of horn are noted with satisfaction by the "powers that be," and when seeing the gouty old colonel ponderously crossing the road in Clubland, to pull up and exclaim, "All right, sir, no hurry"; or in the City, to an excited old lady, "Take your time, madam! I'll wait!" brings forth from the much-dreaded judge, "That's right, my man." Among the 101 things that cause failure and the "Near side, next man up" command are changing speeds noisily, stopping dead between two pavements, thereby causing pedestrians to go round the cab, neglect to give hand signals, remaining too long on tramlines, or behind a crawling "growler," accidental stopping of the engine, non-use of horn, remaining longer than necessary on second speed. One man who failed twice was heard to bitterly remark, "A man has to think of about a dozen things and do four of them all at once," which is about true, and knowing that a lynx-eyed inspector is closely watching every movement of hands and feet, a man can be considered fortunate indeed if he succeeds in getting through the first time.

After he has passed the driving test, and his references are considered good, he is graciously allowed to pay 5s. for his police licence and badge, besides the 5s. motor driver's licence to the L.C.C., which he must purchase before he even touches the steering wheel. Before receiving the cab, and the pleasant news that he may commence earning money, he receives an instructive lesson on the chassis, so that, in case of a breakdown, if he is fairly intelligent and takes an interest in his work, he can repair or put right any little matter which, however simple, often stops a car.

The Motor Cab Company then fit him with uniform and accessories, macintoshes, cleaning coats, &c. He is placed, with a new cab and taximeter complete, on the road, and duly cautioned that politeness and civility cost nothing, and impressed with the fact that wherever he is, and whatever time, if the flag of his taximeter is up he is bound to accept any fare. This will, I think, show the public how carefully the police study their comfort and safety, and also contradict those novelists whose heroes are so often cut off with the proverbial shilling, and, going to a friendly cab proprietor, secure a cab being placed at their disposal. A. N.

IN speaking of the ratios of change speed gears of cars, a simple way of easily obtaining them on any car is as follows:—Engage the clutch and the gears of which the ratios are to be determined. Mark the driving road wheel at its lowest point, and the floor with chalk. Also mark the fly-wheel so as to be able to count its revolutions. Then push the car, counting the revolutions on the fly-wheel until the chalk mark on the driving wheels is again at its lowest point. The ratio will be the number of turns of the fly-wheel to one of the driving wheel. If, for example, the fly-wheel has turned two and one-quarter times, the ratio is two and one-quarter to one. By measuring the distance between the chalk marks on the floor in feet, and dividing it into 5,280, will give the number of turns the driving wheels make in one mile. Multiplying this quotient by the number of turns made by the fly-wheel will give the number of revolutions the motor makes in one mile.

CONTINENTAL NOTES.

The Paris Salon.

The tenth annual Paris *Salon* was opened with great *éclat* on Tuesday last by M. Fallières, the President of the French Republic. The display is, as usual, held in the Grand Palais on the Champs Elysées, and the scheme of decoration and lighting is, if possible, on a more magnificent scale than ever. Every available foot of space is occupied, the exhibits in the main building being confined to pleasure cars and the thousand-and-one accessories and components that go to form the modern automobile. The industrial motor-vehicles, motor-boats, and machine tools are shown in a separate temporary building which has been erected on the Place des Invalides, on the opposite side of the river Seine. This branch shows a considerable extension over last year, and is a busy scene of activity, engines and machines being everywhere shown in operation. In both sections of the *Salon* there are many interesting features which will be fully dealt with in our next and succeeding issues, pressure on our space in connection with the Olympia Show compelling us to hold over our report of that in Paris until next week.

failures or suspensions in the French trade, and it must now be admitted that the industry is passing through a very acute crisis, the issue of which will be difficult to foresee, and may depend upon the hopes held out by the turnover at the *Salon*. The total number of men, including those left for military service, apprentices given leave, and those employed but a nominal number of hours per day, is stated to be quite 10,000. The movement has by no means stopped, and it is fairly certain that a certain number of amalgamations and working arrangements are likely to result from the present situation, more especially as concerns the interior trade of France.

Public Services in Montenegro.

It is reported from Cetinje that the Montenegro postal authorities are preparing to establish a number of public motor-car services for the transport, not only of the mails, but also of passengers.

Luminous Road Signs in France.

Luminous signs are now beginning to be seen in the French Littoral district, to enable chauffeurs to find their way at night. This is the more necessary because of the influx of foreign cars.

Cars arriving at the Paris Salon.

The Position of the French Motor-car Industry.

The gravity of the crisis in the motor-car industry in France may be gauged from the fact that, almost on the eve of the opening of the French *Salon*, the deputy for the Ivry district of Paris called attention in the French Chamber of Deputies to the grave state of affairs, and, in order to impress upon the Government the fact that distress among workmen was already apparent, he proceeded to request an allocation of a thousand pounds in the provisions of the Budget now under discussion for the relief of the indigent families engaged in the motor-car and allied industries. The motion was, of course, negatived, but the figures put forward by the deputy in support of the proposal were eloquent. The commencement of the slack season among motor-car factories, at least in France, is at hand, and at the time when the French deputy made up his return there was an official figure of 4,600 men thrown out of employment, without counting the hundreds who have left for temporary or regulation military service, and there are also numbers in partial employment, and nearly all are working short hours. Since this incident there have been several other

to the southern resorts of France in the early winter and spring. Around Nice are placed electrically illuminated signs instructing motorists to proceed at a speed of 10 kilometres per hour inside the town limits.

Another Light Car Trial.

The Automobile Club of Marseilles has decided to hold a race for light cars in May next year. Three classes will be provided, viz.: (1) Single-cylinder cars up to a maximum bore of 100 mm.; (2) ditto, up to 125 mm.; and (3) four-cylinder vehicles, maximum bore 95 mm.

Miscellaneous Items.

The first licence to a woman driver of a public motor-cab in Berlin has just been issued.—The annual Dutch motor-car exhibition is to be held in Amsterdam from the 17th to the 26th January next.—It is expected that the automobile exhibition in Berlin will be opened on December 5th by the Kaiser.—It is reported that the Nervion Engineering and Shipbuilding Works at Bilbao, Spain, are arranging to take up the construction of motor-cars on the Daimler system.

A DOCTOR'S MOTORING EXPERIENCE IN JAMAICA.

BY JAS. JOHNSTON, M.D.

I HAVE much pleasure in forwarding to the *M.C.J.* some photos of my substitute for a motor-pit. This trestle serves the purpose admirably, is built on a level with what we call a "barbecue," that connects my dispensary and out-rooms. It also has the advantage of being portable; my coloured man takes it down and re-stows it, or puts it up when wanted in twenty minutes or half-an-hour.

My car is a Stanley steamer, and, in my opinion, is just the machine for the colonies. Its fuel is kerosine oil, thus dispensing with the costly (2s. 6d. per gallon) gasoline, but also evading the danger of handling this explosive liquid. The mechanism is so simple that any one with ordinary brains and skill can do all repairs himself. I have had my car now fifteen months, and in that time it has only been on the trestle some half-a-dozen times for minor adjustments. The engine is of 10-h.p., and takes our steepest hills with ease. The burner is 16 inches from the ground, so that ordinary rivers are no obstacle. When fired up in the morning, which takes about as long as would be required to hitch up a pair of horses to a carriage, the pilot light keeps up steam for the day, so that it is ready for any call in an instant. I am not an agent for the car, but I feel sure that many men in the tropics would go in for motoring if they

Dr. Jas. Johnston at the wheel of his Stanley Steam Car.

knew that a ready, reliable, and speedy means of getting over the ground can be had at a reasonable cost in the silent, smooth-running and delightful Stanley.

The terrible earthquake of January last was a sad set-back to Jamaica, and for a time scared tourists from coming with their motor-cars to the island. We, however, presume this to be one of the safest spots on earth now for the next 200 years at least. We have had our earthquake, and for health and facilities for recreation Jamaica stands without a rival. I have been here thirty-three years now; I landed in 1874 a poor consumptive, and can therefore speak with authority on the subject. There are some 1,200 miles of first-class roads well adapted for motor-cars, and the rapid reconstruction of hotels that is now in progress, the ample provision being made for the comfort of visitors to our shores, and the fact that the various lines of steamers running from both the Homeland and the States are booked right up for the coming season, causes us to feel that a bright future lies before our trim little resort, and we will not have long to wait. It is Britain's "New Riviera."

A NEW leather and metal chain case for motor-cars has been brought out by Messrs. Grose, Ltd., of Northampton, and is to be seen on their stand at the Motor Show.

SOME USEFUL NOTES.

THE water-circulating system of petrol cars has reached that state of perfection where it needs little attention other than refilling the radiator, which should be done as often as required. If possible to prevent it, the cooling water should never be allowed to boil. All water used should be strained, to exclude dirt or foreign matter from the radiator and piping.

To replace a cylinder over the piston requires some skill and patience, as considerable difficulty may be found in starting the piston rings into the bore without breaking them. If assistance can be had, one man to lower the cylinder casting and the other to carefully work the rings under the edge, relatively little trouble will be experienced. But if one man alone is to do the work, then the only way to get the rings in place is to put a piece of soft wire around them tight enough to draw them below the surface of the piston—a piece of stout cord will also answer—and after the edge is started cut the wire and take it off.

A CLOGGED silencer will cause loss of power, a trouble which may be detected by cutting out the exhaust box in some way. With a silencer cut-out valve this is a simple matter; if there is no such valve, the silencer or the exhaust pipe may be disconnected in order to make the necessary test, and the opportunity taken of cleaning out the exhaust box.

The Doctor's substitute for a Motor Pit.

THE universal joints on the cardan shaft of a gear-driven car should be given special attention during wet weather. While revolving at a high speed it is almost impossible for any water or liquid mud to lodge on these joints, as it will be thrown away by centrifugal force; but when the car comes to a standstill there is always a certain amount of liquid mud left around these joints, and unless they are well lubricated this will find its way into the joints, and set up a good deal of unnecessary friction and probably squeaking.

THERE are several methods for closing cracks in the water-jackets of petrol motor cylinders, and the best one to employ depends upon the nature and location of the crack and the facilities at hand. One method consists in chipping a dove-tail groove along the length of the crack and pounding this full of solder. Another consists in filling the jacket with a solution of copper sulphate and letting that run (and later ooze) through the crack into a tin pan, into which the cylinder is set, filling it back into the jacket as fast as it runs out. Still another method consists in forming a mould over the crack and filling this with a mixture of plaster of paris and iron filings, then filling the jacket with water. The water getting into the plaster of paris and iron filings will cause this mixture to expand and force some of it into the crack, thereby closing it. The mould must, of course, be rigidly clamped to the cylinder.

THE Pytchley Autocar Company, Ltd., whose garage is in Sheep Street, Northampton, are extending their tyre-repairing department.

THE O.S. patent speedometers, although not directly represented at Olympia by Messrs. W. Searle and Co., are nevertheless to be seen in the hall, where their merits have been well recognised.

THE exports of motor-cars from the United States during the nine months ending with September last reached a value of £992,777, as compared with only £728,835 in the corresponding period of 1906. Of the total the United Kingdom was responsible for no less than £300,788.

THE master of the Blackmore Vale Hounds (Colonel Percy Browne) has issued a notice expressive of the hope that the practice of following hounds with motor-cars will be discontinued. Last season the cars constantly caused foxes to "head," and there was much dissatisfaction at the spoilt sport.

PREACHING at Chester Cathedral on Sunday the Bishop of the Diocese referred to motor-car traffic, and expressed the view that while this should be controlled partly by the law and partly by the action of the local authorities, the real control should come from a public spirit and readiness to consider others on the part of those who own or drive motor-cars.

THE annual Florida race meet is to be held during the last week of March next. A radical change is to be made in the programme, the mile or two-mile record events being more or less subordinated to two long races, one for the racing cars that were built for the abandoned Vanderbilt Cup race on Long Island, and the other for cars of 60-h.p. or less.

THE Anglo American Oil Company, Ltd., have issued a neat pamphlet showing recent motor records which have been won on Pratt's motor spirit. The pamphlet has interest as a chronicle of the important racing and touring events of the year in which Pratt's Motor Spirit has attained distinction by assisting the cars to victory. The illustrations have more than transient interest.

A NEW 10-h.p. steam car known as the "Morris" has lately been put on the market by Messrs. H. E. and F. Morris, of Stroud Green Road, London, N., a firm which has had a long experience of steam automobiles. Pressure on our space prevents us describing the new car at length, but we mention that in outward appearance it closely resembles a petrol vehicle, the engine and boiler being located under the bonnet in front.

ELSEWHERE in the present issue we publish some interesting notes sent us by Dr. Jas. Johnston, of Brown's Town, Jamaica. This gentleman, who will be known to some in this country as the Scotch doctor (from Aberdeen) who in 1902 walked across Africa from Benguella to Zanzibar, is now an enthusiastic motorist. Although he employs a man to clean and oil up his cars, the doctor prefers to drive himself and also makes any necessary adjustments.

UNDER the presidency of Viscount Massereene and Ferrard, the Automobile Co-operative Association entertained a large number of patrons to dinner at the Criterion Restaurant, London, on Monday. In proposing the toast of the Association, Mr. W. Somerville Large, M.I.C.E., explained the objects of the organisation and the system by which illicit commissions are being effectually prevented. The society appears to be gaining a considerable number of supporters, and it is estimated that it is now catering for the users of something like 4,000 cars.

THIS week the new premises of the Motor Agency of the London and Paris Exchange, Ltd., are being opened at 55-59, Shaftesbury Avenue, London, W.C., where the motoring activities of this well-known company will be developed. Their premises are centrally situated so far as the motor industry is concerned, and there is accommodation for about sixty vehicles. The business will be restricted to the sale and exchange of second-hand cars, the London and Paris Exchange Motor Agency having special facilities for bringing intending sellers and prospective buyers together.

HERE AND THERE.

A NEW non-skid pneumatic tyre, known as the "Kempshall," is being introduced by the Kempshall Tyre Company (of Europe), Ltd.

MR. E. T. BRADLEY, 37, Surrey Street, Sheffield, having

qualified for the repair of tyres by the Harvey Frost process, is now adding a department for that work to his business in motor accessories.

THE Middlesbrough Corporation have instructed their borough surveyor to ascertain the costs of municipal motor-wagons as well as the expenses of up-keep, with a view to the adoption of the same if the information he obtains warrants the innovation.

THE certificate of performance of the 48 hours' London traffic trial of the 16-20-h.p. West Aster car, illustrated in our last issue, has been issued by the Royal A.C. The distance run was 482 miles, and the petrol consumption was 16.49 m.p.g., or 27.47 ton m.p.g.

AN ingenious tool to facilitate the connecting up of the driving chains of motor-cars has lately been placed on the market by the "Autok" Fabrik for Radketten, of Berlin, O. 112. The device consists of two tongued parts, A and B (Fig. 1), sliding against each other. The latter part has teeth half way its length

Figs. 1 and 2.

on the lower edge in which a ratchet pivoted to a lug on the part A grips in the toothed rack to hold the chain in place, allowing free use of both hands to connect the chain links. A hand lever C is pivoted to the ratchet lug, and has on its end a link rigidly secured to B. By pulling the lever C to the left the two forked parts draw near each other, as shown in Fig. 2, enabling the connecting bolt to be readily placed in position. An arm is secured on the ratchet, which latter is held in position by a little spring fastened on the lug of A.

THE "Gauthier" whistle will shortly be a familiar sound in our streets, the device of that name now being introduced to the motoring community by Messrs. Gauthier and Co., 8, Great Marlborough Street, London, W. The whistle consists of a brass cylinder, which can be fitted to a tube of any diameter by means of an external ring or washer. The exhaust gas enters the cylinder and is allowed to pass away freely into the atmosphere at the four large apertures. A piston of special construction and self centring, cylindro-conical in shape at its extremity, moves in the body of the cylinder. This piston partially blocks up the four outlets, emitting a high or deep tone, which may be regulated by a screw determining the length of the piston stroke. Thus the whistle can be regulated to suit, first, the motor; and, secondly, the required tone. The Gauthier whistle is operated by means of a cable, and is actuated by a special pedal.

THE Royal A.C. is making an offer for the old War Office site in Piccadilly, W.

FOR driving a motor-car over the turf on Wimbledon Common a motorist has just been fined £2 and costs.

THE "Industrial Motor Review" for November 15th can be obtained from the stand, No. 102, of the *Motor-Car Journal* at Olympia.

THE "Million" Motor Works in the Bath Road, Cheltenham, owned by Messrs. Stretton's, Ltd., are replete with machinery of every description for repair work.

A NEW garage to accommodate between 250 and 300 automobiles has been opened in Hertford Street, Mayfair, W., by the Electromobile Company, of which Mr. Ernest Schenk is chairman.

NEW commercial publications of the Daimler Motor Company include a list of patrons and a collection of testimonials, which establish their claim to have supplied a large proportion of the nobility with motor carriages.

A SYNDICATE has lately been formed in St. Petersburg to introduce a service of motor-buses into the city. Orders for four vehicles have already been placed with the Sud Deutschen Automobilfabrik of Gaggenau, Germany.

GOOD illustrations of close plating and electro-plating are shown by Messrs. Lowe, Bevan and Co. at their stand at the Olympia Exhibition, whereon is a selection of wind screens, Cape cart hoods, &c., of excellent design. Reference to the special features of these will be made in our next issue.

MESSRS. EISEMANN AND CO., of Stuttgart, have just introduced a new sparking plug for use in connection with high-tension magnetos. The central terminal has triple points, shaped

not unlike the points of a gas burner, and across these extends a wire the two ends of which are fastened into the outer shell of the plug at opposite points. Around this wire over the end of the central terminal is wound a short length of platinum wire, from which the spark jumps across to the points of the central rod.

WEIGEL MOTORS, LTD., have sent us a copy of the new catalogue of Weigel cars they have just issued. This includes full particulars of the different models, viz., 25-h.p. and 40-h.p. four-cylinder, and 60-h.p. six-cylinder. The various parts of the chassis are illustrated by reproductions of photographs and line drawings, while several pages are devoted to instructions for oiling and cleaning, and testimonials from users of these vehicles.

ONE of the largest gatherings of automobiles which has ever been brought together for the purpose of a wedding will assemble at the marriage of Princess Louise of Orleans to Prince Charles of Bourbon, which takes place at Wood Norton to-day (Saturday). Over fifty closed cars, consisting of very handsome landaulets and limousines, were sent from the premises of the Motor Supply Company, Ltd., 111, Piccadilly, London, W., on Tuesday and Wednesday, for the service of the many guests attending the function.

DURING the last few weeks more than 120 Rover motor-cabs have been sold to agents by the R.M.C. Syndicate, Ltd., 109, Victoria Street, Westminster, S.W., and other agencies have been established all over the civilised world. Orders for several hundred of the same vehicles are now in negotiation, which amply demonstrates that the Rover motor-cab is expected to become one of the most popular vehicles of the coming year. The Rover Company are now working night and day shifts to cope with the demand for these motor-cabs, of which 500 are to be delivered before the end of next March.

LORD BURGHCLERE and Lord Wandsworth have been elected to membership of the Royal A.C., several members of which were included in the Birthday Honours.

MR. G. CHURCH is the proprietor of the Grand Motor Works and Garage in South Street, Worthing. All kinds of motor repairs are done on the premises by experienced mechanics.

THE London County Council having made application to the Local Government Board for an additional index mark for the registration of motor-cars, the Board has within the last few days issued a fourth index mark consisting of the letters "L.B."

MR. A. BRIDGE, late of Panhard and Levassor, has now joined the Hulbert-Bramley Motor Company, of 96, Upper Richmond Road, Putney, S.W., who are opening capacious premises at 118, Disraeli Road, Putney, where there will be accommodation for about fourteen cars, including private lock-ups.

UNDER the name of "Eatscarbon," Mr. Walter Williams, of Old Town Street, Plymouth, has just introduced a preparation for rapidly removing carbon deposits from the combustion chambers and pistons of petrol motors. The new compound is claimed to have no harmful effect on rubber and metals, and obviates the necessity of taking down the engine cylinder for cleaning purposes.

THE Universal Boiler Fluid Company, of Muckamore, co. Antrim, have sent us a sample of their Osalga liquid compound they have put on the market for removing and preventing the formation of scale in radiators and the water jackets of petrol motors. The firm have hitherto only supplied it in large quantities, but are now arranging for putting it up in half and one gallon tins. The preparation, which will be of interest to those motorists who have suffered from furred-up radiators, is added to the circulation water in the proportion of half-a-pint to four gallons.

MR. A. HOUSE, of the Northern Automobile Company, Ltd., Oak Lane Garage, Manningham, Birmingham, has recently sold a 24-h.p. Stirling single-deck motor-bus to a large colliery company in Yorkshire. The vehicle is to be used as an ambulance and also for carrying stores between the various pits of the colliery. One of the conditions of the purchase was that the vehicle should carry a load of over a ton from Bradford to the colliery company's office, a distance of about twenty-five miles, at an average speed of eight miles per hour, a task which was easily accomplished; in fact, the time occupied in making the trip worked out at ten miles an hour.

ONE of the Mercedes electric carriages of the Electric Landaulette Company, Ltd., made a run of 64 1-5 miles on one charge, on the 31st ult., under the auspices of the R.A.C. The weight of the car was 1 ton 13 cwt. 2 qrs. 10 lbs., and the passengers were the Official Observer and the driver. The run was to Windsor and back, and then in Hyde Park and streets until the battery was so far exhausted as to be unable to propel the car. The journey from the Club Motor House to Windsor, via Staines—21 3-10 miles—was done in 1 h. 33 min., and the return trip from Windsor via Eton and Colnebrook to Hyde Park Corner was accomplished in 1 h. 36 min., the distance being 23 1-2 miles.

THE engine of the "County" car, made by the Halifax Motor-Car Company, of Weymouth Street, Halifax, referred to in the last issue, has four separate cylinders fixed to a raised joining of the crank chamber, thus providing easy access for detachment, the cylinder extension being carried inside. The tappets for the inlet and exhaust valves, which are on opposite sides, are adjustable. In connection with the cylinder cooling there is a special water-way entrance, causing a spiral flow of water round the cylinders in circles to the exit. The crank shaft is provided with five bearings—one between each crank. The clutch is self-contained in the flywheel, thereby avoiding all end thrust, and is easily adjusted by three springs. The gear-box gives three speeds and reverse with a direct drive on the top speed. The transmission is by bevel gear to a live axle, and the road wheels run on a double row of ball bearings on an extension of the axle casing, the weight thereby being taken off the driving axle proper. The car is equipped with a side-entrance body having comfortable accommodation for five persons.

The Olympia Show.

(Continued from page 778.)

A General View of the Show.

SOME TENDENCIES IN DESIGN.

BEFORE continuing our review of the exhibits at the Olympia Show, which was opened on Monday last by the Duke of Connaught, it may be of interest to briefly survey the general tendencies of the design of motor-cars as exemplified in the vehicles that are now on view. When one tries to pick out any particular tendency in so vast a field as motor-car construction, a good many difficulties which hitherto had not been noticed spring up immediately. Of course, the mere attempt would in some measure at least assume a certain amount of knowledge. At the time this article was written, although it was naturally impossible to be *en rapport* with all the latest details, still we were able to gain information, and sufficient anyhow to show clearly what the future will be on many points. The engine is probably the first thing thought of, and is developing in two ways. First, the multiple-cylinder type has come to stay, even in the six-cylinder pattern, whilst its power is, on the whole, moderate. There are new six-cylinders of 15-h.p. and 20-h.p., for example, which seems to point to the fact of a certain demand for them. On the other hand, the four-cylinder type is in the majority, and, in these powers, is really quite as efficient as its larger brother. In regard to another important point, that of ignition, the accumulator is practically dead and buried, being ousted by the magneto. After all, the average motorist, though he may be somewhat dense on a good many points, has by this time learnt to put greater trust in the manufacturers. Of course, it is quite true that in years gone by ignition caused a great deal of trouble, but it is hardly likely at this stage that manufacturers would fit what was unsuitable. At Olympia one is able to see numerous instances of magnetos displacing the battery,

for the past season proved that as far as the ignition is concerned trouble very seldom occurred even in classic events.

Much attention has been devoted to automatic lubrication, and quite time, too, as the long-suffering engines think. What they have endured in the past while the careless driver either starved them or overdosed them so disgracefully that they had in self-defence to protest is pretty well known now. As regards the carburettor, many ingenious experimenters have spent weary hours in trying to solve the problem how to mingle air and petrol correctly, and still crowds of expectant enthusiasts are dabbling with the vexed problem of carburation. Of the making of automatic shutters, self-acting springs or regulators and the like, there is no end, and finality is not yet. Certainly a great advance can be seen in some types, for instance the G. and A., and some of the multiple-jet and the jet-controlled types. The improvements are great enough, indeed, to make it no uncommon thing now for a motorist to run half as far again on the same amount of fuel as last year; the average carburettor is, however, hardly ideal, though one or two exhibits at Olympia are very promising.

In regard to transmission the live axle type has gained a great deal of ground, many cars being fitted with it this year as an alternative to the chain. It has proved so satisfactory in all types of 1907 cars as to be very popular with the public. At the same time the chain drive is retained by many who think that it is, if not more reliable, at any rate easier to repair; the chains are now, however, generally encased to exclude dust and make them noiseless, a long desired step in advance. The present exhibition has numerous instances of the use of four speeds, in a few cases both third and top being direct drive. Gate change-speed control is also in great favour, as it is invaluable for night driving. The multiple-disc clutch still retains its old ground, supported some-

what faint-heartedly by its first cousin the plate type, which has been greatly improved. There are no particular developments in the frame, steering, springs, or road wheels, excepting that a wider steering lock is found as a rule.

A good point in the new cars is the choice purchasers have of different chassis lengths in regard to garage accommodation. As most readers are aware, cars used to be turned out in an arbitrary length which caused a good deal of trouble in housing them, but now purchasers have a selection of two or three different lengths. The same thing can be seen in the body work, as not only is there a choice of style and size in many cases, but, what is better still, the price is largely optional. The coachwork runs

Fig. 18.—View of Valve Side of Daimler Engine, showing how the exhaust pipe is now taken to the front of the car instead of towards the dashboard as before.

to two extremes, on the one hand being very luxurious, even excelling the Pullman car, while on the other the practical side is not lost sight of, and the man of moderate means has a fair choice for so small a sum as £40, and even £25.

On the whole, the motor-cars of 1908, while showing a great wealth of detail improvement, are not very different from the present ones. The point of view of the passenger and owner have been especially studied, and accessibility and facilities for repair have been carefully provided. In view, then, of the

the following changes in the design may be taken as applying to the whole of the Daimler vehicles, whether driven by chains or without. A new departure in the engine is the placing of the valve cam-shaft within the crank chamber, the angular-placed valves being operated through a curved striker acting upon the valve-stem through the medium of a rocking arm. The crank-shaft is made hollow, and is carried on five bearings, in place of three as formerly. Two systems of

Fig. 19.—Sectional View of new Daimler Change-Speed Gear, showing double worm drive to differential shaft.

ignition are provided—magneto and coil and accumulator. The latter system has one trembler and four coils, one in series with each plug placed just above the cylinder heads. It is claimed for this arrangement that it permits of the employment of very short high-tension wires and a low-tension distributor, which latter is mounted on the top of a vertical bevel-driven shaft. As regards the water circulation, a centrifugal pump has been introduced, and the radiator and fan have both

Fig. 20.—Plan of Chassis of Daimler 30-h.p. Live Axle Car.

immense value of detail improvements, their sound qualities and lower prices, the motor-cars of next year will appeal to the public as they have never done before.

The Daimler Cars.

For the 1908 season the DAIMLER COMPANY are making four sizes of chain-driven cars—36-h.p., 42-h.p., 48-h.p., and 58-h.p., the 36-h.p. and 48-h.p. vehicles being made in four lengths of chassis, and the 42-h.p. in three, and the 58-h.p. in two lengths. The most striking Daimler departure for the 1908 season is, however, the introduction of two live-axle models of respectively 30-h.p. and 38-h.p., the first having a bore and stroke of 110 mm. by 130 mm., and the latter 124 mm. by 130 mm. Except where specifically stated,

been modified to give greatly increased efficiency. The pump has duplicate outlet pipes, a pipe being taken from each of these to one pair of the four cylinders, thus ensuring that both water-jackets shall be effectively and equally supplied with the circulating cooling water. Passing now to the transmission, we note that the leather-faced cone clutch is retained. The gear-box on the live-axle vehicle is adapted to give, in addition to the reverse, four forward speeds, with the direct drive on the third. The axle-casing is pressed out of sheet steel in one solid piece, and so designed with a removable panel at the rear that the whole of the bevel gear can be removed without disturbing either axle or wheels. All the 1908 Daimler cars are fitted with four-cylinder engines, the cylinder dimensions of the motors on the chain-driven vehicles being—36-h.p. 120mm. by 150 mm., 42-h.p. 130 mm. by 150 mm.,

48-h.p. 140 mm. by 150 mm., and 58-h.p. 154 mm. by 140 mm. As will be seen from Fig. 19, a radical change has been effected in the transmission in the chain-driven cars, the usual bevel drive between the gear-box and the differential being replaced by two pairs of spiral gears, one transmitting the power when the third speed is directly engaged, and the other when the first, second, fourth, or reverse gears are in mesh. Furthermore, dust and oil tight chain cases of aluminium are now being fitted to the 42-h.p. and 58-h.p. cars. These are so arranged that the adjustment to take up any wear in the chains is effected by rotating eccentrically-mounted bushes which surround the countershaft ends on either side of the chain-sprockets. These cases are also so arranged as to take the place of the usual radius rods. The gear case has the effect of

Fig. 21.—The Vauxhall 12-16-h.p. Landaulet.

rendering the car extremely silent, as well as adding to the life of the chains. A large inspection cover is arranged in the side of the case to allow of the removal of waste grease and oil and the inspection of the chain. The brakes on all the Daimler cars are now arranged to be operated in the opposite way to the usual practice—that is to say, the hand lever actuates the gear brake and the pedal those working on drums attached to the rear wheel hubs. On the chain-driven cars the gear brake is not now fitted on the differential shaft, but, as is shown in Fig. 19, on an extension of one of the gear-box shafts, the same as in live-axle vehicles. Owing to lack of space, the cars on view only number four, these comprising a 30-h.p. 9½ ft. wheel-base live-axle chassis, fitted with a "Black-down" type of landaulet body, painted Royal blue, lined light blue, and upholstered in blue leather and cloth; a 42-h.p. 10½ ft. wheel-base chain-driven car, with an "Aston" type of landaulet body, painted light green, lined light green, upholstered in green leather; a 42-h.p. chain-driven chassis, with an "Hazlewood" phaeton body, painted cream, lined red, upholstered in red leather, fitted with Cape cart hood and glass wind-screen; and a 42-h.p. 11½ ft. wheel-base chain-driven chassis, with a "Longleat" limousine body, painted red, lined gold, upholstered in red leather.

The Vauxhall Cars.

Although only exhibiting one type of car—a 12-16-h.p. four-cylinder vehicle—the display of VAUXHALL MOTORS, LTD., Luton, is an interesting one, and the polished chassis on view will well repay inspection. The engine has separately-cast cylinders 3½ in. bore by 3½ in. stroke; a special type of automatic carburettor furnishes the mixture, while the ignition is by accumulator and single coil, a synchronised high-tension distributor being employed. For those who prefer magneto ignition provision is made for fitting this without difficulty. A noteworthy feature of the Vauxhall vehicles is that the lubrication of the engine is effected by a small pump which forces the oil continuously into the main bearings and through the hollow crank-shaft on to the big ends of the connecting rods. As only the correct amount of oil can be supplied, the annoyance of over-lubrication is obviated. The transmission is through a metal-to-metal cone clutch, and gate-controlled change-speed gear, giving three speeds forward and a reverse, cardan shaft and bevel gear to a well-supported live axle. The vehicle has a wheel-base of 8 ft. 6 in., thus enabling a roomy side-entrance body to be fitted to the chassis. The complete cars on view include two double phaetons, one having a Cape cart hood and front glass screen, a landaulet (Fig. 21), and a two-seated car with leather kit-box at the back, this vehicle being well adapted for touring purposes.

The Niclausse Cars.

A new series of cars to this country is seen in the Niclausse, made by an old-established engineering concern of that name in France, and the British concession for which has been secured by the VICTORIA CARRIAGE WORKS, LTD. Three sizes are being made—15-h.p., 20-h.p., and 35-h.p.—all being fitted with four-cylinder engines and cardan shaft transmission to a live axle. The frame, which is of pressed steel, is inswept in front to allow of a wide

lock. The motor (Fig. 22) has four separately-cast cylinders, with the crank-shaft slightly *desaxé*—that is, the centre point of the cylinder is slightly to one side of that of the crank-shaft. The mechanically operated interchangeable valves are placed on opposite sides. The carburettor is of a special automatic type, while the ignition is by a high-tension magneto with a fixed firing point. Retarding the ignition when starting is rendered unnecessary owing to the fitting of a half-compression device in conjunction with the exhaust valves, which is automatically brought into engagement when the starting-handle is used. The lubrication of the motor is effected under pressure by means of a small gear pump. The water-cooling on the 20-h.p. and 35-h.p. cars is by a centrifugal pump driven direct from the engine shaft. A circulation of air through the radiator is effected both by a fan at the rear of the same and by the vaned arms of the flywheel. The engine is fitted with an automatic governor acting on the carburettor, which is claimed to effect an economy in petrol consumption. This can be put out of action by an accelerator pedal, while the speed of the motor can also be separately regulated by a lever on the steering-wheel, which actuates a variable lift to the inlet valves. The clutch is of the multiple-disc metal-to-metal type. The gear-box is fitted throughout with ball bearings. A double sliding gear is adopted, controlled by a single lever, giving four speeds forward and a reverse, with a direct drive on the top. The transmission is by means of a double-jointed cardan shaft of a special design, in which the use of universal-joint pins is obviated. The rear road wheels are mounted on ball bearings on the axle casing; the axles themselves have thus only the driving effort to withstand, the power being transmitted to the road wheels through the hubs. The steering gear is provided with means of readily taking up any wear; it has also a very wide lock, allowing the turning of the car within a small radius. The suspension is effected by four long side-springs and one transverse spring at the back. The brakes, which are effective in either direction, are all so arranged that when the foot or hand lever is operated the clutch is first withdrawn; the foot brake is also so connected that it automatically throttles the engine when the brake is applied. Altogether, the Niclausse form an interesting addition to the list of French-built cars.

The Withers Car.

The display of MESSRS. WITHERS AND CO., LTD., London, W., comprise three highly-finished 30-h.p. vehicles. The motive power is supplied by an Aster four-cylinder engine, with two systems of high-tension ignition—Eisemann magneto and coil and accumulators. The standard gear box is adapted to give four speeds forward and a reverse, with direct drive on the top, the control being by a single lever working in a "gate." One of the cars on view, however, is fitted with the Wicksteed patent change speed gear. The final transmission is by a cardan shaft and bevel gear to a well-designed live axle. Ball bearings are used to all parts except the engine, and the frame, which is raised at the rear to give clearance for the differential casing, is supported on

Fig. 22—View of Inlet Side of Niclausse 15-h.p. Motor.

five long springs. A new arrangement for starting the engine from the driver's seat is fitted to one of the vehicles. This is known as Page's, and consists of a hand lever which actuates a double ratchet device mounted on the front of the motor. In addition to the main petrol tank, which is provided with pressure feed, a small gravity supply tank is provided as a reverse. The cars on view include a limousine with detachable top, a limousine-landaulet, and a Berlin-limousine. The body of the latter, which is of the firm's own construction, is of novel design, a small door being provided in the centre of the front seat, which is provided with a detachable cushion, so that a passenger can change his position and ride either inside or out, without having to descend on the road.

The Wasp Car.

An interesting new 50-60-h.p. six-cylinder car, known as the "Wasp," and constructed by the THAMES BANK WHARF MOTOR WORKS, LTD., is to be seen at the stand of the Euston Motor Company. Fig. 23 shows the car fitted with a side-entrance double-phaeton body, but that exhibited has a Pullman limousine body with detachable sides. The chassis is fitted with a six-cylinder engine, having cylinders 130 mm.

now located in new works at Clapham, S.W., and have produced a new 35-45-h.p. six-cylinder car (Fig. 24) which makes its public *début* at the Show. The frame, which is of pressed steel, is supported on five springs, a transverse spring supplementing the usual four longitudinal ones. The engine, which is of a neat and clean design, is of a relatively slow-running type, 38-h.p. being developed at a speed of 1,000 revolutions per minute. The cylinders, which are 110 mm. bore by 150 mm.

Fig. 23.—The Wasp Six-Cylinder Car.

bore by 140 mm. stroke, cast in pairs, and the valves arranged on opposite sides. The Xenia automatic carburettor is employed to furnish the mixture, while two systems of high-tension ignition are provided. The speed of the motor is controlled by both hand and foot levers. The transmission is through a metal-to-metal clutch, comprising two large shoes, which expand inside the fly-wheel. The change speed gear is of the usual sliding type, giving three speeds forward and a reverse, the drive being by double-jointed cardan shaft to the live axle. The latter is of strong construction, and drives the hubs through dog clutches,

stroke, are cast in pairs. The valves are all mechanically actuated off a single cam-shaft. The ignition is dual, both magneto and coil and accumulators being provided, a high-tension distributor being used in connection with the latter system. The lubrication of the motor is effected automatically. The upper part of the crank chamber has three partitions, one for each two pins of the crank, with oil reservoirs alongside the webs to the main journals. A large pipe is cast down the centre of the webs and the ends of each partition, by which oil is fed under pressure to the journals. The lower part of the crank chamber has three wells to

Fig. 24.—The M.M.C. 35-45-h.p. Six-Cylinder Chassis.

the weight of the car being supported on the axle casing. Ball bearings are used to all parts. The vehicle has the appearance of being both speedy and smooth-running. At the same stand is to be seen a 15-h.p. Courier car, fitted with one of the Coventry Simplex Company's four-cylinder engines. The latter has the valves arranged all on the one side, a noteworthy fact being that the crank shaft is fitted with ball bearings. The transmission follows the usual design of live axle cars, the clutch being of the leather-faced cone type. The vehicle is fitted with a side-entrance double-phaeton body, and is listed at a moderate price.

The M.M.C. Six-cylinder Car.

All old motorists will, we feel sure, be glad to witness the reappearance of the MOTOR MANUFACTURING COMPANY, LTD., which was one of the first firms in the motor trade in this country. The company are

carry the requisite lubricant for each pair of crank pins, and can be removed as a whole, leaving all the bearings in position. The cover for the timing case is in one piece, and forms a complete oil-tight joint. The radiator, which is of the honeycomb type, is provided with an air-inducing fan. The clutch is of the multiple-disc type, and the change-speed gear, which has "gate" control, gives three speeds forward and a reverse, with direct drive on top. The standard transmission is by a cardan shaft and bevel gear to a live axle, although a side chain drive can be supplied where desired. The live axle is of a strong design, and the casing of the driving and driven bevel pinions is so arranged that different sizes of wheels can be fitted to render the gearing best suited to individual requirements. A notable feature of the design is that both the foot and hand operated brakes are all on drums attached to the hubs of the rear road wheels, one working

internally and the other externally, both being compensated. With the exception of the engine crank-shaft, ball bearings are fitted to all parts, even to the valve cam-shaft. The wheel-base of the vehicle is 10 ft. 6 in., which enables a roomy closed or open side-entrance body to be fitted. The M.M.C. Company are also arranging for the production of a 25-35-h.p. four-cylinder car on similar lines for the 1908 season. The excellent wearing qualities of the old M.M.C. cars have won for them many friends in the motoring world, to whom an inspection of the new models can be recommended.

Clyde Cars.

The exhibits of Messrs. G. H. WAIT AND Co., Leicester, comprise an 8-10-h.p. two-cylinder two-seated car, a 12-14-h.p. three-cylinder four-seated car, and a 16-20-h.p. four-cylinder side-entrance double phaeton. The engines are of the White and Poppe type, the special feature being the improved inlet pipe from the carburettor, which

Fig. 25.—The Clyde Change-Speed Gear.

insures each cylinder taking its charge direct from the mixing chamber, thus ensuring a constant supply to all cylinders. The principal point of the Clyde cars lies in the transmission mechanism. The engine is located at right angles to the usual position, i.e., the crank-shaft is parallel with the wheel axles. A long and silent chain connects the crank-shaft through the clutch with a short countershaft mounted in front of the rear axle. This shaft carries the change-speed gear, which is adapted to give three speeds and reverse, the drive being transmitted direct on all speeds to the back axle. The gear, which is controlled by a lever working in a "gate," is of the type in which the pinions are always in mesh, the required pair being brought into action by means of dog clutches. The arrangement is such that any speed can be obtained from the neutral position, without it being necessary to pass through the others. This system of transmission has shown itself to be very efficient, proof of which is found in the success which has attended the Clyde cars in the various hill-climbing competitions in which they have been entered.

with tubing, joint, or gear. The method of attachment also facilitates the use of interchangeable bodies. The frames are suspended on five springs, while in all the cars the working parts, such as engine, gear, &c., are completely enclosed and protected from dust, mud, &c., by steel casings fitted under the chassis, which can be removed with ease. These casings taper from the centre towards the front and rear, the shape preventing the air resistance and reducing the amount of dust which usually follows a car to the smallest possible amount. The 15-h.p.

Fig. 26.—The Engine of the Delaunay-Belleville 15-h.p. Six-Cylinder Car.

four-cylinder car has been specially designed for town use with covered bodies, or for touring with light open bodies. The cylinders are cast in pairs, the dimensions being 98 mm. bore by 122 mm. stroke. The valves are arranged on one side of the engine, being operated off a single cam shaft. The high-tension magneto and water pump are situated in a readily-accessible position in front of the motor. The lubrication is on the well-known Delaunay-Belleville pressure system. The radiator fan is fitted with a special belt adjustment, which can be regulated with ease. The carburettor is of the automatic type, with the spraying

Fig. 27.—The Chassis of the Delaunay-Belleville 40-h.p. Six-Cylinder Car.

The Delaunay-Belleville Cars.

For the 1908 season a wide range of these cars is being made, comprising six different types—15-h.p. four-cylinder, 15-h.p. six-cylinder, 20-h.p. four-cylinder, 28-h.p. four-cylinder, 40-h.p. four-cylinder, and 40-h.p. six-cylinder, the first three having live axles and the others side-chain drive. The motor and its component parts, the water and petrol tanks, &c., are all grouped together on the fore part of the chassis, thus forming a unit in which tubing, joints, and other parts are reduced to a minimum. The driving and transmission gears are entirely connected to the steel frame, so that the whole mechanism and its accessories are independent of the carriage work. The body is attached to the chassis by means of four bolts, which need only to be unscrewed to remove the body from the chassis without the necessity of interfering

jet on the lower part and the extra air valve on the upper portion. The suction of the engine produces two gas currents, which are directed on to a double cone from opposite directions, thus ensuring complete pulverisation of the fuel. The throttle lever is situated on a fixed sector on the steering wheel, and is so arranged that the speed of the engine can be set to a given number of revolutions, and further acceleration be obtained by a pedal which acts independently in regard to opening the throttle to the maximum. The clutch is of the leather-covered cone type, and, as the male portion is centred on an extension of the crank shaft, the alignment is constant and certain. The male portion is formed of high-grade rolled steel, which allows a much lighter form of cone to be used than if the same were a casting, and the reduction of weight of the clutch components and shaft is such that

the revolving mass quickly comes to rest when the clutch is withdrawn, thus allowing change of gear to be made without any objectionable grating noise. The clutch spring exerts its pressure directly on the centre of the clutch, and the tension is easily regulated. The change-speed gear has two sliding sleeves, and a reduction in the size of the gear-box has been effected by using a special system of assembling the gears, which enables much shorter shafts to be used. Four speeds and a reverse are provided, with a direct drive on top speed. The back axle runs on ball bearings, and the driving shaft is fitted with a spring drive, which effectually absorbs the shocks due to starting and stopping. The 15-h.p. six-cylinder chassis has been introduced to meet the demand for a car that can be used for town work, in addition to ordinary

Fig. 28.—View of Engine of Daimler-Mercedes 35-h.p. Four-Cylinder Car.

touring purposes, and yet combine smooth running and silence with a low running cost. The chassis is identical in construction in everything except the engine with the 15-h.p. four-cylinder. As will be seen from Fig. 26, the cylinders are cast in groups of three, and the valves are arranged all on one side. The cylinder dimensions are 85 mm. bore by 120 mm. stroke. The ignition is high-tension magneto, and is fixed in a similar position on the crank chamber to that of the 15-h.p. four-cylinder, and the same remark applies to the water pump. The 20-h.p. four-cylinder car has separately-cast cylinders, with the inlet valves on one side and the exhaust valves on the other. The dimensions are 110 mm. by 130 mm. stroke, and, owing to the compression being greater than in the smaller types, a compression-release device is fitted to enable the motor to be started without difficulty. The carburettor is situated on the right-hand side of the motor, and its component parts are so arranged that dismantling is facilitated in order to inspect same. The ignition is high-tension magneto, and the magneto machine and water pump are arranged symmetrically on the front of the engine, and coupled to their respective cam shafts. They are attached by means of a steel band, which makes a rigid attachment by the use of a single screw. They are driven from the cam shafts by cardan joints composed of a washer hollowed out in the form of a cross, the method of arrangement being such that these parts can be easily dismantled. The clutch is of the leather-covered cone type, the cone being cast in aluminium. The clutch spring is so fitted that there is no end thrust from same when engine is running. The tension of the spring can be easily adjusted by means of two screws placed in an accessible position. A ball thrust-collar is fitted where the fork which withdraws the clutch operates. The clutch is coupled to the main gear shaft by means of an intermediate shaft fitted with two cardan joints, which allows the gear-box and clutch to be easily removable as separate units. The back axle runs on ball bearings. The differential casting is extended to the centre crossbar; it is connected to it by means of a case containing shock-absorbing springs. This arrangement necessitates the use of a cardan shaft with two universal joints, but it has the advantage of reducing to a minimum any shock that may take place when starting or stopping the car. The hand brakes acting on the rear wheels are of the internal expansion type; they consist of a drum and a hub upon which the two brake-shoes are secured. The opening and closing of the shoes is produced by a set of levers designed to enable great pressure to be applied. Metal friction-plates are riveted on the shoes, and their shape is such that in whatever direction they may be travelling they fling off any foreign body which may come in contact with the surface. Fig. 27 gives a view of the chassis of the 40-h.p. six-cylinder chain-driven car. The engine comprises six separate cylinders of the same bore and stroke as the 28-h.p.—viz., 115 mm. by 130 mm. The crank shaft is of one piece, and supported by a bearing between every crank throw. The ignition is by high-tension magneto, and in order to facilitate the starting a half-compression device is fitted. The clutch

is of the leather-faced cone type; the declutching movement is obtained by twin cams acting upon a ball thrust bearing. The position of this collar can be adjusted in order to maintain the same position in the event of the cone having worn slightly and penetrated further into the flywheel. The clutch is connected to the change-speed gear by an intermediary shaft with a universal joint at each end. The sprocket bearings are supported independently on the frame of the chassis, while the back axle is so designed that chain cases can be easily fitted. The lubrication of all working parts of the motor is effected by means of oil circulation under pressure, actuated by a valveless pump driven direct from the crank shaft. The patent for this system was granted on January 14th, 1897, and Messrs. Delaunay-Belleville have applied it to hundreds of their steam engines of horse powers ranging from 10 to 7,000 h.p. As regards complete cars, the exhibit of the BURLINGTON CARRIAGE COMPANY, LTD., the British agents for the Delaunay-Belleville vehicles, comprises a 40-h.p. limousine designed to give ample accommodation for seven passengers. The exterior is an exquisite scheme of colour, being a special shade of Bordeaux red lined in relief, and with the undercarriage and wings picked out in lines which blend in a harmonious manner with the general scheme. The interior is in French cord, and the upholstering of the seats is most luxurious. A multiplicity of fittings, such as speaking-tube, electric light, travelling cases, &c., are provided. A 28-h.p. landaulet has a somewhat novel hood, so arranged that the leather part, even after a heavy season's work, will be practically as smart as when new. Needless to say, the body work is of the highest class, the combination of the Burlington Company's experience in this direction with the Delaunay-Belleville chassis resulting in a vehicle which has already achieved popularity in high circles, not only in this country, but abroad.

The Daimler-Mercedes Cars.

Two interesting chassis of the Daimler-Mercedes cars built at Sheffield are to be seen at the stand of Mr. E. H. JONES, a 35-h.p. four-cylinder and a 60-h.p. six-cylinder. Interest is largely centred on the latter, which is shown for the first time, and is an excellent example of modern high-grade automobile construction. The cylinders, which are cast in pairs, are 110 mm. bore by 140 mm. stroke. The valves are arranged on opposite sides, being operated by cams formed solid on their shaft. The ignition is by low-tension magneto, provision being made for advancing or retarding the firing point from the steering wheel. Both foot and hand control of the throttle are provided, the carburettor being of a special automatic air-regulating type, combining means of varying the petrol jet by a lever on the dashboard. A mechanically-operated lubricator driven off the water pump shaft is

Fig. 29.—Rear View of Chassis of Daimler-Mercedes 35-h.p. Four-Cylinder Car.

fitted, by means of which the engine receives oil in direct proportion to its speed. The lubricator is placed under the bonnet, leaving the dashboard free, except for a single tube that acts as a tell-tale. The water is circulated by a gear-driven centrifugal pump. The air draught is assisted by means of vanes embodied in the flywheel, and, in addition, a fan is fixed behind the honeycomb radiator. The latter, it may be added, is supported on pivots, so that no strain, and consequent leakage, is transmitted to it. The clutch is of the multiple-disc type; the "gate"-controlled gear-box gives four speeds and a reverse, with a direct drive on the top. The final drive is by side chains. Ample brakes are fitted; on the countershaft there are two band brakes working in unison with each other, and operated by a pedal, while on the rear wheels internal expanding brakes are fitted, these being operated by either the extreme right pedal or by the side lever, the brakes

having a dual connection. Ball bearings of extra large diameter are used throughout the engine, transmission, and wheels. The 35-h.p. four-cylinder car (Figs. 28 and 29) has already been described in the *M.C.J.* In general arrangement it follows the design of the 60-h.p. car dealt with above, the bore and stroke being the same. In view of their relatively low price, the Daimler-Mercedes cars are well worthy of attention. At this stand is also to be seen a new all-steel road wheel, which is claimed to be not only stronger but considerably lighter than the usual type.

The Sheffield Simplex Six-Cylinder Car.

One of the features of the Show is the new Sheffield-Simplex 45-h.p. six-cylinder car exhibited by the SHEFFIELD-SIMPLEX MOTOR WORKS, LTD., of which Mr. Percy Richardson is the managing director. The

Fig. 30.—Sectional Elevation of "Sheffield-Simplex" 45-h.p. Six-Cylinder Engine.

vehicle is a successor to the Brotherhood car, and, while retaining many of the features of the latter, quite a number of improvements have been introduced, as will be seen from the following description. The engine (Fig. 30) has the cylinders cast in pairs, with the valves all located at one side. Each pair of cylinders exhausts into a separate pipe connected at its lower end with the main exhaust pipe. The cylinder dimensions are $4\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke. The carburettor is of a special automatic type, in which an air-tight float chamber is employed. Connection is made between the upper part of the chamber and the admission pipe, so that the suction of the engine acts both on the float chamber and the jet. In this way not only an economy in fuel is effected, but a more perfect mixture ensured. The admission pipe is of a square section, and while occupying a relatively small space, is so arranged internally

fitted with readily-detached spring caps are formed in one side of the engine support arms, these forming a means of quickly replenishing the oil supply in the base-chamber at any time. Large inspection holes are provided in the bottom of the base-chamber, the mud shield below being so arranged that it can be readily removed to give access thereto. The control of the engine speed by means of a lateral-moving pedal, as introduced on the Brotherhood car, is retained, but this has been improved by mounting it on a ball bearing. Ball bearings are fitted not only to the crank shaft but also to the camshaft—in fact, it may be said that

Fig. 31.—Front Elevation of "Sheffield-Simplex" 45-h.p. Six-Cylinder Engine.

they are used throughout the car. The crank shaft bearings are supported in the top half of the crank-chamber, enabling the bottom portion to be removed without disturbing any of the parts. A simple but useful addition is seen in a small projection cast on the sides of the cylinders, which form supports for a screwdriver or any other available tool to enable the valves to be detached with a minimum of trouble. The clutch (Fig. 33) is of the Hele-Shaw type, the pedal operating it being connected to the foot brake. The first portion of the travel of the pedal disengages the clutch, the further movement applying the brake. The gear box, which is "gate" controlled, gives three speeds forward and a

Fig. 32.—Plan of Chassis of "Sheffield-Simplex" Six-Cylinder Car.

that a full supply of gas for each cylinder is ensured. Two systems of ignition are provided, the feature of the high-tension magneto being the combination therewith of a low-tension contact maker for the accumulator system. Attention may also be drawn to the high-tension ignition wiring; the wires for the six cylinders are all moulded together in insulated material and encased in vulcanite, an innovation both interesting and useful. The water circulation is maintained by a gear-driven pump of special design. It is located on the valve side of the motor, and can be easily detached. The radiator is of the usual honeycomb type, but of a distinctive shape. It is provided with an air-inducing fan driven off the pump shaft. The radiator frame is made with only one joint, so that the risk of leakage is reduced to a minimum. Holes

reverse, with a direct drive on top speed. The gear shafts are hollow and of large diameter. A point about the change speed control mechanism is that in place of having to slide the lever and sleeve to operate the gear change, the lever is furnished with a fulcrum giving a freer action, greater leverage, and obviating any tendency of the selecting lever to bind in its bearings. From the gear-box the power is transmitted by a cardan shaft and bevel gear to the live axle; the whole of the cardan shaft is enclosed in a casing (see Fig. 37), which acts as a torque rod. The forward end of the casing terminates in a globular joint, which not only forms a shield for the joint, but allows for movement of the back axle in all directions. A support for the globular joint is carried by a cross member on the frame. Fig. 35,

which gives a plan and elevation of the rear axle, shows that the latter is of the arched type, and allows the wheels to be splayed as in chain-driven vehicles. This style of construction is rendered possible by introducing two barrel square joints on the live axle, one on each side. These are shown at B, Fig. 36. The latter illustration shows that the differential case is split horizontally, and can be readily detached; moreover, by taking off the axle caps and withdrawing the shafts from the barrel-square joints the bevel wheel and the differential gear can be entirely removed from the chassis. As will be seen, the differential gear

Fig. 33.—Sectional View of Clutch of "Sheffield-Simplex" Six-Cylinder Car and Operating Gear of same.

is of the spur pinion type. The weight of the car is carried on the axle casing, the axle driving the road wheel hubs through dog clutches. The brakes of the car are also of an interesting design. Both the foot and the hand-controlled brakes are centred on drums attached to the hubs of the rear wheels, and are of the internal expanding type. A view of the drum is shown in Fig. 35, from which it will be seen that each brake acts on a separate surface. The frame is of pressed steel, and

Fig. 34.—The "Sheffield-Simplex" 45-h.p. Six-Cylinder Touring Car.

is quite straight, the front and rear ends being tied together by cross bars. The chassis is supported on five springs, which are of the type introduced on the Brotherhood car—i.e., they are provided with means of lubricating each leaf. A good feature, too, is seen in the fitting of grease cups to all the spring shackles. The feature of the steering pivots is that they are set slightly out of the perpendicular in order to make their centres coincide with the point of contact of the road wheels on the ground, and so facilitate steering. Special attention is drawn to the lubrication, an interesting form of mechanical lubricator being fitted to the dashboard. There are five pumps in the lubricator, actuated by a chain-driven cam shaft. Three of them are connected to the engine,

one to the gear-box, and one to the universal joint of the cardan shaft. From the latter the oil flows through the cardan casing to the differential case and thence along the axle to the road wheels. The complete cars on view include a limousine, a landaulet, and an open touring car to seat five persons, with Cape hood and glass screen. In the latter luggage space is arranged under both the front and the rear seats, a sliding luggage grid being also located under the back seat. Tool lockers are provided, as also accommodation for accumulators and acetylene generators in boxes under the side steps.

Fig. 35.—Part Sectional Plan and Elevation of Rear Axle of "Sheffield-Simplex" Six-Cylinder Car, showing inclined road wheels, spur differential gear, double hub brakes and improved brake operating toggle cam.

The Jackson Car.

As usual, Messrs. R. REYNOLD JACKSON AND Co. make an interesting display of the Jackson vehicles, which, in view of their relatively low

Figs. 36 and 37.—View of Bevel Gear Drive on "Sheffield-Simplex" Six-Cylinder Car, the top half of the differential casing being removed. This illustration also shows the spur differential gear and the barrel-square joints B, which allow the live axle to be arched. The lower picture is a view of the Rear Axle of the "Sheffield-Simplex" Six-Cylinder Car, showing the spherical joint at the forward end of the cardan shaft sleeve; the latter acts as the torque rod.

prices, combined with sound construction, have rendered them exceedingly popular. A prominent place on the stand is given to the novel two-seated car illustrated in a recent issue of the *M.C.J.* This vehicle, which has the appearance of a miniature racer, is fitted with a De Dion 8-9-h.p. engine, driving through a leather cone clutch and three-speed gear-box to a live axle. Other cars on view include a 6-h.p. phaeton and an 8-h.p. dogcart, both being fitted with De Dion engines. Various detail improvements have been introduced into these vehicles with the view of increasing their reliability, while to render them more comfortable to the passengers a transverse spring at the rear is now included in the suspension system.

The De Dietrich Cars.

The De Dietrich cars are exhibited by Messrs. JARROTT AND LETTS on two different stands, the French-built vehicles being displayed on one, while the other is devoted to the new British-built De Dietrich. Dealing first with those which hail from across the Channel, it may be stated that four models are on view—14-18-h.p., 18-23-h.p., 23-35-h.p., and 40-50-h.p. The last three have four cylinders, with the interchangeable valves arranged on opposite sides; the ignition is by low-tension magneto, with automatic advance according to the speed of the engine. At the same time, a hand control is fitted, so that the firing point can be set to any desired position. To facilitate starting a half-compression device is provided in connection with the exhaust valves. The lubrication of the engine is effected by a pump driven off the cam shaft, the oil tank being located below the engine supporting arms on the exhaust side. A new clutch of the metallic disc type, with an adjustable spring tension, transmits the power to the gear box through a universal joint, which allows for any slight distortion of the frame whilst travelling over rough roads, and also permits the clutch to be dismantled without disturbing the engine or gear box. The latter, which is "gate" controlled, provides four speeds forward and one reverse. By a new arrangement the third and fourth speeds are driven direct from the engine to the counter-shaft. The main shaft carries at its rear end two bevel pinions, each meshing with its corresponding bevel wheel on the differential shaft. On the first, second, and reverse speeds the power is transmitted through a bevel pinion on the side shaft to a separate bevel on the differential. There are thus three pairs of bevel wheels in connection with the driving gear. Special attention has been devoted to the brakes. The rear road wheels have two large drums, to which are attached the driving sprockets. Inside these drums are expanding segments, operated by means of a "pull-on" hand lever. A compensating device is fitted to equalise the pressure on each wheel, and further provision is made to absorb the shocks which would otherwise be thrown on the brake gear whilst travelling over rough roads with the brakes on. The differential shaft is provided with two brakes operated by a single pedal. Fig. 40 depicts the latest departure of the De Dietrich Company—a 14-18-h.p. live axle car, designed for use as a town car. The engine is a smaller model of the chain-driven types, high-tension magneto ignition being, however, fitted in place of low tension. The clutch is of the metal disc type, while the gear gives four forward speeds and a reverse. The rear axle is similar in design to that in the 20-30-h.p. car mentioned below. The frame can be supplied either curved, as illustrated, or straight, the former facilitating the fitting of very low carriage bodies with roomy side doors. As regards the British-built Lorraine Dietrich, in which considerable interest is being shown, only one type is at present being turned out—a 20-30-h.p. model, this being very much on the lines of the 14-18-h.p. referred to above. The car has been designed to suit English roads, and, having a long, low frame, can be fitted with either touring or town carriage bodies. The engine has four cylinders cast in pairs, 110 mm. bore by 130 mm. stroke, fitted

ball bearing at the forward end of the crank shaft. The gear box provides four speeds forward and one reverse, operated by a "gate" controlled lever. The drive is transmitted to the live axle by means of a cardan shaft, which is supported by a cold-drawn taper steel tube, the latter acting as a torque rod. The rear axle is very strong in design, is oil-retaining, and fitted with ball bearings. The road wheels are mounted on the outer casing, and are driven by dog clutches fitted in the wheel hubs. In this way the actual driving shafts do not have to bear

Figs. 38 and 39.—Sectional Views of new Bosch Low-Tension Make and Break Plugs employed on the 1908 Mercedes Cars.

any of the weight of the car. The rear axle is of the arched type, enabling the road wheels to be splayed, as in chain-driven cars. This is obtained by introducing a special form of joint in the live axle. Self-lubricating ball bearings are fitted throughout the chassis, while shock absorbers are now provided on all the cars.

The Mercedes Cars.

We have already given some particulars of the 1908 models of the Mercedes cars built by the GERMAN DAIMLER COMPANY, together with

Fig. 40.—Chassis of De Dietrich 14-18-h.p. Car.

with low-tension magneto ignition, so arranged as to automatically adjust the firing point to secure the greatest efficiency at all speeds. The lubrication is automatic, starting when the engine is started and ceasing automatically when the motor is not running. It is operated by means of mechanical pumps, which force the oil up to a sight-feed lubricator on the dashboard, it being afterwards pumped under pressure to the various bearings. A feature of the engine design is the adoption of a

two illustrations. As we previously pointed out, one of the new departures is found in the ignition. While the low-tension system is retained, the usual make-and-break rod and tappets are all done away with, their place being taken by a neat electro-magnetic arrangement arranged in the form of a sparking-plug of little more than the usual size. The new system, which has been developed by Herr Bosch, makes use of an ordinary low-tension magneto, the current from which

passes through a distributor, which conveys it in turn to the different cylinders. Figs. 38 and 39, for which we are indebted to the *Allgemeine Automobil Zeitung* of Vienna, give two sectional views of the make-and-break plug. The latter comprises a lever which works on a pivot S, and the lower end of which is normally in contact with the piece A. M are the pole-pieces of an ordinary magnet, round which is a coil W. As the distributor makes contact with the different cylinders, a current of electricity passes through the winding W, which, converting the pieces M into magnets, attracts the upper end of the lever, as shown in Fig. 39, the lower end breaking away from A, a large, fat spark taking place between the two, so igniting the explosive charge. A

Fig. 41. - Details of Clutch on Napier Cars.

spring causes the lever to return to the position shown in Fig. 38. The ignition is, as will be seen, somewhat on the lines of that known as the Simplex, introduced a few years ago in this country.

The Napier Cars.

Three cars and a chassis, all fitted with six-cylinder engines, form the exhibit of Messrs. S. F. EDGE, LTD. The vehicles on view comprise a 30-h.p. side-entrance touring car with a Cape hood, a 40-h.p. chassis, a 40-h.p. double landaulet, and a 60-h.p. Pullman limousine. The new 30-h.p. Napier chainless car has so recently been described in the *M.C.J.* that no further reference to the chassis is necessary. Its rela-

be entirely enclosed. The speciality of the hood is that it can be opened out or shut up by one person alone simply by turning a small handle fitted on one side. This operation opens the hood entirely in one minute from its folded state behind the rear passengers to its position extending half-way over the bonnet, and *vice versa*. Fig. 42 gives a view of the chassis of the 40-h.p. car, which, as will be seen, is fitted with the Rudge-Whitworth detachable wire wheels. The engine cylinders are cast in pairs. The valve tappets have adjustable tops, with the object of taking up wear, and, in addition, each tappet is fitted with a small coiled spring, which automatically holds the tappet up to the valve and eliminates noise. The Napier synchronised ignition by accumulator is used, one coil in conjunction with a contact-maker and a high-tension distributor fires each sparking plug in its turn, and ensures absolutely accurate timing in each and every cylinder. A magneto can be fitted, if desired, instead. The carburettor is of a very simple type, combining a throttle-valve and automatic air intake and an auxiliary air-valve controlled by the driver. The throttle lever on the steering wheel is set to give a maximum speed of about twenty miles per hour, the increase above this being made by a foot-controlled accelerator. The drive of the engine is transmitted to the gear-box by the Napier multiple-plate clutch. Fig. 41 shows the various parts of the clutch dismantled. The plates or discs C are made of different metals arranged alternately, one set being carried by the box B and the other by the boss D. The discs in the box B are free to slide inside the same, but not to rotate; similarly, those carried by D can slide, but not rotate, on the boss. To convey the power of the engine from the flywheel to B, and through the discs to D, all the plates are thrust together by means of springs E pushing the plate F. This forces the whole of the plates towards the flywheel, and, on account of the number of discs employed, while each disc has relatively to convey only a very small amount of power, the total amount of gripping surface is very great. Three adjusting screws G are provided; the thrust-block H is for releasing the clutch, and as this is drawn away from the flywheel it approaches a disc, I, which acts as a clutch brake to enable the first and reverse speeds to be engaged silently. A removable stud J is provided to enable lubricant to be poured into the clutch-box, which forms an oil-tight bath for the plates to run in. The change-speed gear, which is adapted to give three speeds forward, runs on no less than seven ball bearings. The sliding wheels do not move on a square shaft, as usual, but on a castellated shaft having eight grooves. The top gear is a direct drive, and when in use the gear-box merely acts as a long bearing for the driving shaft transmitting the power to the live axle. The propeller shaft and live axle shafts are steel forgings; the latter have the differential wheels in one piece solid with them, and the whole of the live axle runs on ball bearings. Other features of the design are the straight side-members of the frame and deep section pressed steel cross-members braced together with tie-rods. The torque rod is widely splayed at the rear end, where it is attached to the casing of the differential gear, and is connected at the front end to the chassis by the medium of a ball-joint held between an upper and lower spring strongly compressed in a vertical box suspended from a hinged joint. The frame

Fig. 42. - Chassis of Napier 40-h.p. Six-Cylinder Car.

tively low price brings the six-cylinder car within the range of a large clientele, and we are informed that already over 300 have been ordered. The car exhibited has an open touring type body. The rear seat is designed to give ample room for three occupants. The space under both back and front seats is designed to take spare parts, and a reserve tyre can be carried in a convenient bracket fitted on the right-hand side of the driver over the platform step. An entirely new patented design of Cape hood is fitted, this being covered with waterproof material and provided with attachable side-curtains and a roll-up screen with windows to let down at the back of the driver's seat, enabling the rear of the car to

is suspended on five long springs, which, in conjunction with the Napier "road equalisers," prevent any road shocks being transmitted to the passengers. The 60-h.p. chainless chassis on view is fitted with a Pullman limousine body, with ample seating accommodation in the interior for five persons—three on the main seat and two on large and comfortable additional seats arranged so that the occupants face forward. These two seats when not in use fold up against the side of the car, leaving the whole of the interior space available for the occupants of the hind seat. A folding table is fitted, divided in the centre. The roof extends forward over the driver's seat, and is supported in front by two hollow

steel pillars attached to the dashboard; over this is fitted a large glass wind-screen for the protection of the driver and passenger at his side. Throughout the whole scheme of this car comfort has been studied. A thick felt pad extends over the floor, on the top of which is a pile carpet of a shade in unison with the buff ribbed cloth of the upholstery. The woodwork, including interior panels and window-frames, is of polished mahogany. All the windows, with the exception of that at the back of the car, are arranged to open, and silk blinds on spring rollers are fitted throughout. Three handsome electric lamps are in the roof; means of communication between the passengers and driver

the valves are placed on opposite sides. The bore is $3\frac{1}{2}$ in., and the stroke $4\frac{1}{2}$ in. On this car the ignition is by low-tension magneto; the make and brake gear is located on the top right side of the motor, and is operated through a worm gear-driven shaft. Means are provided for advancing and retarding the ignition. The carburettor is of the Grouville-Arquembourg automatic type. The transmission is through a leather cone clutch, three-speed gear box, and cardan shaft. The latter is provided with a casing, which acts as the torque rod. The exhibit also includes the C.S.B. 25-30-h.p. side-entrance car built for the Maharajah of Bikanir. The car has also an engine with four cylinders in

Fig. 143.—Chassis of S.P.A. 60-h.p. Six-Cylinder Car. (See page 806).

are provided, also ash-trays, mirrors, and all the various fittings necessary to a well-appointed car. The central portion of the roof is arranged to accommodate luggage, and a ladder is provided, folded neatly out of sight in a box.

The Straker-Squire Cars.

Prominent in the display of Messrs. STRAKER AND SQUIRE, LTD., are two new British-built vehicles. One of these is a new 12-14-h.p. car, known as the "Shamrock." The motor comprises four cylinders cast in pairs, 85 mm. bore by 85 mm. stroke, the valves being arranged on one side. The ignition is by coil and accumulators, the contact maker

one casting. The dimensions in this case are 110 mm. by 130 mm. Low-tension magneto ignition is adopted. All the valve gear is enclosed by large aluminium plates with bayonet catches. Large inspection doors are provided in the base chamber for obtaining access to the crank shaft bearings. The control of the engine is by a single lever working on a quadrant on the steering wheel, which actuates the valve lift from zero to $\frac{1}{2}$ on the quadrant, the other $\frac{1}{2}$ of quadrant being half compression, which is used only for starting purposes. The shaft of the admission cam is hollow, and presents, opposite to each valve, a slot in which a cam works perpendicularly to the axis, and allows of it sliding freely and without play. In the interior of this shaft, and made from a single

Fig. 44.—Chassis of the Straker-Squire 16-20-h.p. Four-Cylinder Car.

being located on the upper end of a vertical spindle driven off the cam shaft. The spindle is extended downward to operate the oil pump. The water circulation is on the thermo-siphon system, no pump being employed. The clutch is of the leather-faced cone type. The gear box is adapted to give three forward speeds in addition to the reverse, the transmission being by cardan shaft and bevel gear to a live axle. The brakes are all centred on the rear road wheels hubs, twin brake drums being provided to each. The vehicle is built with two-seated body, and should prove a speedy little car. The other new model is a 16-20-h.p. car (Fig. 44), the four cylinders of which are all in one casting, and

piece, is another shaft, which carries, at the point where the cams are, an eccentric, which supports and controls the movement of the cams. The end of this shaft extends outside the hollow shaft, and is connected by a pinion wheel with the control lever on the steering wheel. The hollow shaft is rotated directly by the engine. It follows, then, that as the control lever is moved over the quadrant, the eccentrics are rotated, and the cams having to mount on them, a variable lift is given to the valves. The engine is lubricated by a rotary pump in the lower portion of the crank case, which draws the oil from a sump and delivers it to the different bearings. The change speed gear is of a patented

type, providing for the teeth of the respective gear-wheels becoming engaged previous to any load being thrown upon them. The three speeds and reverse are obtained by two sliding trains, which are movable on the shaft. In order to obtain the speed desired one slides the corresponding train upon the shaft, engagement with the gear-wheels then takes place without grinding or shock, because the train is still free, and has to overcome its own inertia till it revolves at the same speed as the train on the other shaft. A dog-clutch secures the wheels in their respective positions. The actuation of the two sliding trains is

Fig. 45.—The Siddeley 14-h.p. Side-Entrance Double Phaeton.

effected by a single lever working in a novel form of quadrant. The final drive is by cardan shaft to a live axle.

The Siddeley Cars.

The WOLSELEY TOOL AND MOTOR CAR COMPANY, LTD., are showing six samples of their "Siddeley" cars—three being in the form of complete vehicles and three being the chassis only. They consist of one four-cylinder 14-h.p., two four-cylinder 18-h.p., one four-cylinder 30-h.p., one four-cylinder 40-h.p., and one six-cylinder 45-h.p. All except the last mentioned, which is chain-driven, are of the live axle type. The new models for 1908 are three in number—the 14-h.p., the 18-h.p. type de luxe, and the 40-h.p. live axle. The first mentioned has a four-cylinder engine of 3.9-16 in. bore and 4 in. stroke, giving under R.A.C. rating 20-3-h.p. The cylinders are cast in pairs, with the valves located on one side. Thermo-siphon cooling is employed, and very large water-pipes are fitted. Coil and accumulator electric ignition is standard, but magneto can also be had at an extra charge. The commutator is arranged in front of the dash and above the rear cylinder. A noticeable feature of this, as, in fact, in all the engines, is the separation of the carburettor from the throttle and auxiliary-air valves, the former being located on the right of the motor and the latter mounted immediately above the inlet pipe on the left. Between the leather-faced cone clutch and the gear-box a universal joint is provided. The three-speed gear-box has a three-point suspension, and is exceedingly compact. The drive is direct on top speed. The foot-brake is of the external type on the propeller shaft, and the side-brakes are internal, expanding in drums on the back wheels. The live axle is well supported, and has only the driving effort to withstand, the road wheels, which are mounted on the casing, receiving the power through the hubs. The vehicle, which has a wheel-base of 8 ft. 9 in., is an exceedingly interesting model, and, in view of its general suitability for everyday use and touring and relatively low price, a large demand may be anticipated. The new 18-h.p. chassis is founded on the old model of the same power.

Fig. 46.—The Inlet Pipe and Throttle of the Siddeley Cars.

but it has various improvements. For instance, magneto as well as high-tension ignition by coil and accumulators is provided, while a gear-driven pump in the base chamber forces oil to all the engine bearings direct. The contact-maker is now brought up just above the rear cylinder and in front of the dashboard. The gear-box is "gate"-controlled, and gives four forward speeds, the direct drive being on the third. The new model 40-h.p. four-cylinder live axle car has been produced to meet the demand for a more powerful light touring vehicle. The bore of cylinders is 5 in. by 5½ in. stroke. It is equipped with high-tension magneto ignition, as well as coil and accumulators. The transmission is through a metal cone clutch, four-speed gear-box, with direct drive on the third, cardan shaft and bevel gear. The other "Siddeley" models for 1908 are as follows: 10-h.p. two-cylinder, 18-h.p. four-cylinder standard, 30-h.p. four-cylinder chassis, and 40-h.p. chain-drive and 45-h.p. chain-drive. On all the cars the Elastos detachable flange rims will be fitted, if desired, at a small extra charge, and a

prominent feature is the provision in connection with the rear axle of all cars of 14-h.p. and over of the Wolseley shock absorber, illustrated in the last issue of the *M.C.J.*

Argylls, London, Ltd.

Unfortunately, owing to cramped position in the Annexe, ARGYLLS, LONDON, LTD., are only responsible for two cars—viz., the 16-20-h.p. with a seven-seated limousine body by Mulliner, of Northampton, and a 14-16-h.p. Argyll landaulet. Both cars are painted in a rich dark coach blue, with black mouldings with a fine primrose line. The interior of each is tastefully upholstered in buff cord and fitted up with all necessary little details to add to the comfort of the occupants. An extension is provided over the driver's seat of each car, and is fitted with a folding glass wind screen and luggage rail. Several improvements have been effected in the 1908 14-16-h.p. model, these being referred to in our report of the exhibit of Argyll Motors, Ltd., Alexandria, N.B. As the 16-20-h.p. car has given such great satisfaction during the past season, it is being retained as a standard model for 1908 without any alteration to the chassis except to facilitate minor adjustments.

The S.P.A. Cars.

The S.P.A. cars, which made their debut in this country at the Cordingley Show in April last, are now being handled by the S.P.A. MOTOR COMPANY, LTD., of 7, Harrington Road, London, S.W. For the 1908 season four sizes of these increasingly popular vehicles are being made—viz., 20-h.p. and 40-h.p. four-cylinder, and 30-h.p. and 60-h.p. six-cylinder, the cylinder dimensions of the first and third being 95 mm. bore by 120 mm. stroke and of the second and fourth 130 mm. by 145 mm. The cars (Fig. 43) made by La Societa Piemontese Automobili Ansaldo-

Fig. 47.—The Siddeley 30-h.p. Engine.

Ceirano, of Turin, Italy, are all the live axle variety, and, except as concerns the number of cylinders, are identical as regards the details, so that the following particulars may be taken as applying to all. The object of the designer has been to so arrange the leading components that any of them may be readily detached without disturbing the others. The cylinders are cast in pairs, and have the valves arranged on opposite sides. The carburettor is of a special automatic type, claimed to give an exactly proportioned mixture at all engine speeds. The ignition is by low-tension magneto, the make and break of two cylinders being actuated by a single cam mounted on the upper end of a spindle which passes up through the cylinder-head casting, so giving free access to the valve springs, and enabling the inlet pipes to be so arranged that the mixture from the carburettor has an equal distance to travel to each of the cylinders. The clutch is of the multiple-disc type, and the change-speed gear, which is adapted to give four speeds and a reverse, is controlled by a lever working in a gate. On the top speed the drive is direct through the cardan shaft and bevel gear to a well-supported live axle. The latter is of the arched type—a practice which is now becoming general with Italian designers; two bevel pinions are mounted on the extension of the cardan shaft, these gearing with their own bevel wheels on the live axle. The end thrust is in this way claimed to be balanced and the strain on the axle reduced. Ball bearings are, of course, fitted to all parts except the engine. Altogether, the S.P.A. vehicles are excellent examples of modern high-grade automobile construction.

The "Covey" Speed Indicators.

The "Covey" patent speed indicators and speed recorders have been so recently referred to in our columns that on the present occasion it will suffice to say that they are to be seen on the stand of the COWKY ENGINEERING COMPANY, LTD., of the Archer Works, Kew Gardens, S.W. The "Covey" trip mileage recorder shows the distance run and should not be missed by visitors, who will also be interested in the Extension speed indicator, which comprises two dials, one fitted on the dashboard and the other on the inside of the body of the car in combination with a clock for the use of passengers. Sound workmanship as well as scientific principles of design have combined to give the necessary reliability to these devices.

The Argyll Cars.

For the 1908 season ARGYLL MOTORS, LTD., are turning out five models—viz., 12-16-h.p., 14-16-h.p., 16-20-h.p., 26-30-h.p., and 40-h.p., all fitted with four-cylinder engines and live axles. A great many changes and improvements have been effected in the 14-16-h.p. car, with the view of making the parts simpler and more efficient. The frame is the same design as the 1907 model, of inverted U section, with the front spring pockets pressed out of the same material as the side-runners, giving a maximum of strength with the minimum weight of material. In addition to extra long rear side-springs, a transverse spring has been

introduced, which render it more complete. The first is that it is possible to alter the proportion of air to petrol while the engine is running, and thus obtain the best mixture. The second point is that it is possible to shut off all connection with the petrol jet, and allow nothing but pure air to enter the engine. This, in addition to giving considerable braking power, serves to remove any deposit of carbonised oil from pistons and plugs; and, last, but not least, by destroying the vacuum produced when the throttle is closed, prevents oil from being sucked up into the cylinders. All the operations are performed by one lever, the arrangement being such that, when the valve is full shut, fresh

Fig. 48.—Elevation of Chassis of Argyll 40-h.p. Car

fitted, making the springing of the car most comfortable. The engine is of the same design as last year, but the cylinders and pistons are of entirely new pattern; the water-jacket has been made more accessible, and fitted with large top cover, while the piston has been lengthened and lightened. The section of the carrying arms of the engine crank case has been altered to secure sufficient space for the steering-gear box, thus enabling more rake to be given to the steering column. The lubrication of the engine bearings has also had considerable attention, a pressure-fed system having been adopted. A small geared oil pump is fitted to the rear end of the motor, driven by the exhaust cam shaft,

air only passes into the engine. The clutch is of the metal disc clutch type, a new and simpler disengaging gear having been adopted. The drive is taken to the gear-box through a universal coupling, designed to allow the clutch to be dismantled when necessary, without interfering at all with the gear-box. The change-speed gear is of the usual "Govan" type, giving three speeds forward and a reverse. The universal joints on the cardan shaft are of an entirely new design, the centres of the two cross pins passing through one another. The sliding movement is taken up in a fork at the rear end. To outward appearance, the live axle is similar to that fitted last season, but the hubs

Fig. 49.—Chassis of "Standard" 40-h.p. Six Cylinder Car.—(See page 88.)

which lifts oil from a sump in the bottom half of the crank case, and forces it to the main bearings, through oil-ways in the crank shaft, to the connecting rod big ends. A specially-designed tell-tale is fitted to the dashboard to enable the driver to see that the system is in perfect working order; a test cock is also located in an accessible position in the crank chamber for convenience in filling the oil reservoir to the proper height. The engine is provided with the new "Argyll" carburettor, recently illustrated in the *M.C.J.* The device has several novel points; in addition to performing the ordinary functions of an automatic carburettor in a very perfect manner, two extra features are

are now arranged to run on extra large ball bearings on extensions of the axle casing, the drive from the live axle to the hubs being by dog clutches. One of the 14-16-h.p. cars on view is fitted with a limousine body, finished in blue and upholstered in grey ribbed cloth. Another model of the same power has a side entrance double phaeton of the "Modele de Luxe" type. The body has special dimensions, and every care possible has been taken to ensure the passengers' comfort. The exhibit also comprises a chassis of the new 40-h.p. car, but, as this was fully described and illustrated in the *M.C.J.* only a few weeks ago, no further reference thereto need be made.

The Standard Cars.

A car which has, under the ægis of Mr. Friswell, gained considerable prominence during the season is the Standard, built by the STANDARD MOTOR COMPANY, LTD., Coventry. For 1908 two models are being made—20-h.p. and 40-h.p., both being fitted with six-cylinder engines. Both vehicles are, generally speaking, on similar lines, so that the following particulars, except where specifically stated, may be taken to apply equally as well to one as to the other. The cylinders are cast in pairs, with the valves arranged all on one side; the dimensions in the case of the 20-h.p. engine are $3\frac{1}{4}$ in. bore by $3\frac{1}{4}$ in. stroke, and of the 40-h.p. 4 in. by 5 in. The bottom half of the base chamber can be detached without disturbing the crank shaft bearings. The ignition is by Simms-Bosch high-tension magneto, gear driven off the same shaft

Fig. 50.—View of Carburettor Side of "Standard" Six cylinder Engine.

as the water pump. A feature of the automatic carburettor is the ease with which the various parts can be detached for inspection. A tubular radiator is employed, this being of extra large size, enabling a fan to be dispensed with. On the smaller car the lubrication of the motor is effected by gravity through a sight feed rack on the dashboard, while on the 40-h.p. a pump is provided, this being fixed to the lower half of the crank chamber. The central portion of the latter is made in the form of a well. The pump forces the oil through a filter,

detachable with equal facility. The differential casing is of the spur pinion type; the casing surrounding it is fitted with a large detachable cover at the rear, to enable the gear to be examined. Ball bearings are used throughout the gear-box and axles. The chassis is of such a length as to permit of a roomy closed or open side-entrance body to be fitted to either model. The vehicles are British built throughout, and are noteworthy for their silent and smooth running, as well as for their moderate price.

The Darracq Cars.

The range of Darracq vehicles for the 1908 season comprises 7-9-h.p. single-cylinder, 8-10-h.p. and 10-12-h.p. double-cylinder, 14-16-h.p.,

Fig. 51.—Rear View of Chassis of Darracq 18-h.p. Car, showing the H-section back axle, change-speed gear and differential box.

18-h.p., 25-35-h.p. four-cylinder, and 50-60-h.p. six-cylinder. Principal interest centres on the new 14-16-h.p. and 18-h.p. models, the design of which, while not entirely novel, inasmuch as a car on somewhat similar lines was exhibited by M. Henriod at the 1906 Paris Salon, is a striking departure from current practice. The details appended, while applying more particularly to the 18-h.p. type, may also be taken as appertaining to the 14-16-h.p. The frames are splendid examples of pressed steel work, the difference in section at different points to form

Fig. 52.—Plan of the Chassis of Darracq 18-h.p. Car.

and distributes it to the different bearings of the engine, the surplus oil running back to the well. The clutch is of the metal-to-metal type, consisting of a single plate held between the flywheel and a floating ring. The gear-box is very compact, reducing the length of the shafts to a minimum. The three speeds and reverse are controlled by a lever working in a "gate." On the top speed the drive is direct through a cardan shaft to the live axle. The universal joints are of a special design. It is exceedingly simple, but somewhat difficult to describe, in the absence of illustrations. It may be stated, however, that no pins or nuts are used in its construction. By loosening one bolt, the cardan shaft can be readily removed from the chassis, the bevel pinion being

supports for various parts of the car's mechanism being noteworthy. The side-members are inset in the front to increase the steering lock, and set up at the rear to give a lower centre of gravity to the complete car. The chassis is suspended on semi-elliptic springs back and front, with a supplementary transverse spring behind. The four cylinders of the motor (Fig. 53) are cast *en bloc*, with the valves all on the one side. Cast integral with the cylinders is an expansion chamber for the exhaust gases, having longitudinal ribs to assist in dissipating the heat, a single pipe leading from this expansion chamber to the silencer; a similar method is adopted in regard to the inlet valves, one pipe leading from the carburettor to a port formed midway in the hollow

casting running the whole length of the engine, and having communication with the inlet valve ports and interior of the cylinders. The cam shaft operating all the valves is enclosed in the top of the aluminium crank case, the valve tappet guides being held in position by a single screw, so that removal is an easy matter. Over the valves are fitted neat screw-in plugs, those over the inlet valves accommodating the sparking plugs. The cylinders, which have a bore and a stroke of 100 mm. by 100 mm., are held to the crank case by bolts and nuts on either side, two of the holding bolts passing through the cylinder flanges extending downwards, and serving to hold the lower and detachable half of the centre crank shaft bearing in place. The end bearings are fixed in a similar way, so that the bottom half of the crank case has no connection with the bearings, and can be detached without in any way disturbing these parts. A hinged inspection door is also provided in the base chamber, to enable the big ends to be inspected. The carburettor, pump, and magneto are mounted on the engine, which thus forms a complete unit. The carburettor has a single jet and auxiliary valve placed on the top, the air ports being opened by the same hand lever that manipulates the throttle. A foot accelerator is also fitted, inter-connected with the hand throttle. The ignition is by high-tension magneto, which by slackening one nut can be withdrawn from its seating on the top half of the crank case. To all intents and purposes the ignition is fixed, inasmuch as there is no connection from it to the steering wheel. The advance and retard mechanism is connected to a horizontal rod ending with a brass knob, which projects just outside the front of the chassis immediately below the radiator, and alongside a similar knob on the end of the carburettor "tickler." This latter is rather unique. Instead of the usual small bell-crank lever for

latter, being deeply bowed, brings the horizontal ends in a line with the differential driving shafts on either side of the gear-box, passing through the solid axle, and driving the road wheels through the medium of a dog clutch. The construction of the change-speed gear elements can be seen from Fig. 54, which shows the large bevel wheel on one end of the primary shaft and the differential gear at the other. The sliding elements are fitted to the primary shaft, with a dog clutch for the direct drive. Three speeds forward and one reverse are provided, operated by the single lever, which has a "gate" control. Ball bearings are fitted to all parts. The box containing the change-speed gears and differential can be removed *en bloc* by unscrewing four bolts. The foot-brake drum is placed on the end of the secondary shaft of the gear-box on the outside, the brake shoes being of the internal expanding metal type. The rear road wheels are fitted with similar brakes placed in the usual position. The innovations will probably be called daring in some quarters, and certainly they are of such an unconventional nature that they are creating a considerable amount of interest in motoring circles. It may be presumed, however, that such radical departures would not be adopted unless they had been thoroughly tested; in fact, the system has been employed on the Darracq racers for the last three years. The complete cars on view include an 18-h.p. with a standard open touring body of the Roi des Belges type, with seating capacity for five persons. The 25-35-h.p. car has cylinders of a bore and stroke of 120 mm. by 120 mm. Double high-tension ignition is fitted, while the change-speed gear, which is situated in the usual position, gives four forward speeds and a reverse, operated by a "gate" controlled lever. The chassis in all other respects is the same as the well-known 1907 20-28-h.p. type. It is, however, now supplied in two lengths, one suitable for a double

Fig. 53.—The Darracq 18-h.p. Motor.

lifting or depressing the float spindle, in order to flood the carburettor, a small slotted wedge-shaped piece of steel normally rests with its thin end under the float spindle, the latter, of course, resting in the slot. When the wedge is pulled forward by the outside knob on the end of the connecting spindle, the thicker section of the wedge lifts the float needle valve. The lubrication of the engine is effected from a reservoir placed on the dashboard, having feed pipes to different parts of the motor, the oil being forced through sight feeds by a pump driven by a belt off the cam shaft. An auxiliary hand oil pump is also fitted. The water circulating pump is of large capacity, and placed in front of and in direct contact with the detachable section of the crank case covering the train of gear wheels, it being operated by the same wheel which operates the magneto. The leather-faced cone clutch is fitted with springs under the leather to give a more delicate engagement, provision being made for adjusting the tension of the springs. The most striking feature of the new car is the transmission, the change-speed gear elements, differential, and bevel gearing being all contained in one casting disposed on a solid rear axle with independent parallel driving shafts. One long cardan shaft conveys the power from the clutch to these driving shafts, and the usual centrally-located gear-box being eliminated. The axle proper, which carries the road wheels, is solid for the greater part of its length, and is of H section forged nickel steel, the ends assuming a horizontal position, and being bored through to accommodate the driving shafts. The gear-box (Fig. 54), containing the change-speed gears, differential, and driving bevels, is of oblong shape, and is bolted in a transverse position on the top of the solid axle. This

Fig. 54.—The New Darracq Change Speed Gear.

phaeton and the other for a limousine. The continued demand for a six-cylinder car is responsible for an entirely new type. The chassis is modelled on the same lines as the 25-35-h.p. vehicle, due allowance, of course, being made for the increased horse-power of the motor. The engine dimensions are 120 mm. by 120 mm. bore and stroke. The car on the stand is of the well-known limousine type, with a seating capacity of seven people.

Vacuum Mobiloils.

Nowadays the merits of the productions of the VACUUM OIL COMPANY, LTD., of Norfolk Street, Strand, London, W.C., are so well-known that reference thereto need not be lengthy. Suffice it to say that the company is represented in the gallery at the show by a large selection of their vacuum mobiloils. These are specially prepared for various purposes, that known as A being for the cylinder and crank chamber lubrication of water-cooled engines, and B for air-cooled engines, as well as for the single-cylinder type of water-cooled motors. Other special oils are for gears, and also for steam cars. Included in the range of specialties displayed is a Mobilubricant which is employed for all purposes where grease or solidified oil is generally required. For electric cars the company have the "Electra" oil; other specialties comprehended in the display including vacuum graphite grease for the lubrication of chains, a leather oil for leather lined clutches, and the "Hecla" oil for the cylinders of engines employing steam superheated above 500 deg. F.

Pratt's Motor Spirit.

The familiar green cans in which Pratt's motor spirit has been conveyed for many years draw the attention of visitors to the stand of the ANGLO-AMERICAN OIL COMPANY, LTD. Here, too, will be found the white cans similarly identified with the transport of the company's 760 spirit. As usual, additional interest is given to the exhibit by a collection of samples of petroleum and its products, as well as models and sketches illustrating various methods of handling and transporting the same. The organisation of the business so that Pratt's motor spirit can be obtained in every village throughout the country is an achievement of no small importance to the motorist. For wherever he goes, throughout the United Kingdom, supplies of Pratt's motor spirit are available.

Acetylene Lighting, &c.

Although the demonstration of acetylene lighting by the ACETYLENE ILLUMINATING COMPANY, LTD., 268-270, South Lambeth Road, S.W., naturally constitutes the main attraction at their stand, attention must be drawn to the specimens of work done by the dissolved acetylene method of autogenous welding with the oxy-acetylene blowpipe. The company make a special feature of the repair of cast iron and steel, broken gear cases, cracked cylinders, &c., and the examples on the stand prove the justice of their claim as to the effectual character of the work done. Cheapness and rapidity are also other merits which will appeal to many of our readers. With reference to the dissolved acetylene for the illumination of motor-cars, the company may be congratulated on the success they have met in getting their cylinders placed in motor depots throughout the country, the sign "D.A." being now very familiar in all the leading and many of the smaller places throughout the country—so that those who adopt the system need have no qualms as to not being able to secure replenishment of the cylinders, made in a standard size of 20 cubic ft., wherever they may be on tour. The acetylene is supplied clean, dry and purified ready for use. The cylinders are filled with a porous material soaked in acetone, gas is then pumped into the cylinders and is dissolved by the acetone. When fully charged the pressure in the cylinders is 150 lbs., and as the pressure is released the gas is given off until the cylinder is exhausted. The standard dissolved acetylene lighting set for cars consists of a 20 cubic ft. cylinder, a key and stirrup block, and a combined regulator and pressure gauge, and having thus acquired the outfit the motorist can light up his car with perfect safety and great economy. The entire absence of smell and the extreme cleanliness of the arrangement are points in favour of the system for which the Acetylene Illuminating Company, Ltd., is responsible. The latest device to further ensure the economy of Dissolved Acetylene is the introduction of a bye-pass so that the gas can be turned down in traffic or when the car is to be left standing for any time.

Pullman's Non-Skids.

Among the makers of non-skid bands and similar devices calculated to ensure the safety of motor-cars on uncertain roads Messrs. R. AND J. PULLMAN, LTD., of the Westbrook Mills, Godalming, Surrey, have attained distinction. They have been able to combine long acquaintance with the leather industry with a practical knowledge of motoring, with the result that their specialities have not only early attracted attention when introduced, but have maintained their reputation through many seasons of service. Their "Leather" non-skid band is their "latest word" in this connection. Here we have a band that is a combination of leather and rubber with hardened rivets embedded in the latter so that they cannot penetrate through to the tyre—thus preventing any possibility of injury thereto. The band is vulcanised on to form part of the tyre, and can be replaced when the rivets are worn, when the tyre will be found as good as new. An automatic auxiliary air valve, by means of which petrol consumption can be appreciably reduced, is also shown on this stand, where are also Pullman's well-known tyre levers to facilitate the removal and fixing on of all tyres and a selection of leather specialities. The fact that Messrs R. and J. Pullman Ltd., have been established as leather dressers for 200 years should give confidence to those who adopt their motor gloves and gauntlets, electric chamois leather for cleaning purposes, &c. Their "Kaspine" lubricant is another excellent production exhibited at Olympia.

Bowley's Motor Spirit, &c.

In the original "bright red cans" the motor spirit of Messrs. BOWLEY AND SON is made known to visitors to the gallery. The experience of the firm in the distillation and refining of motor spirit dates back a long way into the history of the industry, and the standard grades have given proofs of their efficiency under the most trying conditions. Several qualities of fuel oils are shown as well as "Carmeline" for oil engines and motors, the firm's "Champion" motor oils and motor greases, and Messrs. Bowley and Son's lubricating oils for all classes of machinery. With regard to lubricants for motor-cars, too much caution cannot be taken in procuring a thoroughly efficient lubricating oil for petrol motors. Many oils which pass muster in ordinary cases fail when used on an engine working for long spells up to its maximum capacity; the heat and strain on the piston far exceeds that of an engine running on intermittent work, and unless an efficient, suitable oil is used, there is excessive strain and wear set up, with consequent loss of power and ultimate breakdown. It is, there-

fore, particularly necessary, for the efficient lubrication of petrol engines, to use an oil with a high flash-point to stand the heat in cylinders without carbonising, and sufficient viscosity to thoroughly lubricate the hot pistons. Messrs. Bowley's "Champion" oil meets all the requirements of an efficient and reliable oil for this purpose; it will not "gum," give any acid reaction, nor at increased temperatures appreciably lose its viscosity. Attention may also be drawn to Benzolite, which is rapidly coming to the front.

A New Non-Skid and Tyre.

At the stand of Messrs. J. LIVERSIDGE AND SON, LTD., 196, Old Street E.C., will be found a new non-skid band which has distinctive features that should favour its trial by motorists who have given thought and study to the problem of skidding. In his new device the inventor has sought to combine ideas and produce a band that can serve its purpose under any conditions. In place of the usual metal studs he has alternate steel and rubber studs with conical heads, so that resiliency is not sacrificed, and yet there is sufficient metal surface on the roadway to prevent slipping on greasy surfaces. This new non-skid, known as the "Scott," is made as a band in all sizes for pneumatic tyres, and we shall anticipate a run on a car fitted with the device with more than ordinary interest. The well-known "De Nevers" grooved solid tyres are also shown in 2½ in., 3 in., 3½ in., 4 in., and 5 in. sizes. On this stand will also be found the K.T. tyre, which is now to be seen on many vehicles—both private and public—in the streets. This is a pneumatic stud or non-spring tyre. The rubber is made in a long, flat strip with projecting studs, which have an air space below. A circular perforated steel boltless rim, with holes to receive the studs, encloses the rubber, so that the stud heads are the only projection. The air spaces are closed with steel washers, some of which are lapped to take the screw ends of the bolts making the attachment with the wheel. The rim with the rubber is forced over the binding rim of the wheel under compression, and the whole arrangement is ready for the road. The appearance of the tyre resemble a double row of large studs, and is obviously well calculated to withstand side-slip, whether on large or small cars. The system of construction is also remarkable in that the tyre throws up little or no mud laterally—an important consideration in congested traffic. Resiliency is not sacrificed, while the durability of the device is undoubted. The K.T. tyre is certainly an interesting innovation and one with a future.

The Palmer Tyres.

Interest in the cording machine that is employed in making the Palmer cord tyres is generally shown by visitors. Motorists are familiar with the merits of these tyres, the new catalogue of which will be useful to all owners of cars applying for the same to 119, Shaftesbury Avenue, W.C. In addition to the Palmer cord tyres a variety of accessories in connection with the same are shown, and visitors to this stand should also inspect the Palmer tyre testing gauge, which has been designed to test the pressure in pneumatic tyres, an important consideration. Simplicity is the keynote of the instrument. It is only necessary to screw the gauge on to the valve and then bend the flexible tube, which latter operation causes the deflating pin of the valve to be pushed inwards. As a perfect joint is made before the valve pin is moved, there is no leakage of compressed air. There are no taps or valves to get out of order, and no fine holes to get filled up. A special bracket is provided for carrying the tester, which may be screwed on to the dashboard or any other accessible part of the car.

Gears.

The exhibits on the stand of Messrs. DAVID BROWN AND SONS, LTD., are such as will interest motor-car manufacturers mainly. The firm have made a close study of the correct form of teeth for spurs, bevels and worms, and the result of their investigations is shown in the 15-h.p. gear cases, worm reduction gears, steering gears, together with a number of rawhide spurs, paper pinions, spur wheels, bevels, &c., which are displayed for examination on their stand. The 15-h.p. gear case, the working of which is being demonstrated, is the outcome of many tests which have been made where the teeth of gears have to withstand sudden and great stress. The adoption of a greater angle of obliquity is said to have increased the strength of these gears nearly 50 per cent., and whilst diminishing the length of teeth, the arc of contact is increased, thus giving a greater efficiency. A gear case similar to that running is dismantled and all the detail parts are available for inspection.

Motor Accessories.

From the very early days of the motor industry Messrs. G. T. RICHES AND COMPANY have been associated with the trade in motor accessories, and from 19, Store Street, London, W.C., they are conducting a wide connection with motorists throughout the country. Hence the interest which attaches to their varied display at the present exhibition. Their accessories, &c., are very comprehensive, from the "Acme" trumpet siren to Plaxeline, the latter a liquid band cleaner removing all grease and gaining favour even where other preparations have failed. Eucalyne, Plaxine, "pamiss" hard soap, &c., as well as a variety of cleaning cloths and other compounds and materials for maintaining the good appearance of both car and driver, are shown. At the stand is a full selection of exhaust whistle alarms, tyre levers, rubber goggles, tyre carriers, &c. The "Store" tool kit is a very type of such indispensable adjuncts to the car, and attention may also be drawn to the Turco

electric vulcaniser, which is proving a useful aid to the motorist in repairing tyre troubles. Messrs. Riches and Company are able to supply all descriptions of general accessories and spare parts for Panhard, Aster, De Dion, Darracq, Clement and other leading motors.

The Milometer.

In addition to their exhibit of Nagant-Hobson cars on the ground floor, Messrs. H. M. HOBSON, LTD., of 29, Vauxhall Bridge Road, S.W., are showing the Jenatzky tyres and other specialities in the gallery. At one of their stands in the latter section of the show the Elliott motor-meter is also demonstrated. This has satisfied many speedy as well as ordinary touring motorists of its accuracy, and, in view of magisterial acceptance—in some places at least—of the calculations of the speed indicator, it should have an increasing popularity. Working parts have been reduced to a minimum, and the variety of indications by the hands is a good feature. It is driven from the front off side wheel by means of a flexible shaft, which can be readily removed for examination. It runs at about the same speed as the front wheel of the car. A strong driving gear is provided, which has the advantage of silence, and the device itself is not likely to be affected by water, dust, and vibration. The movement of the pointer is regular, following the changes in speed exactly and immediately, without going in jumps, recording the mileage per hour. A cyclometer can also be fitted, which is provided with three hands of different colours. The white one makes one revolution of the dial in 100 miles working on a scale which is clearly subdivided into tens and units. Two small blanks are provided on the face where the mileage up to date is shown. The black hand also makes the 100 mile revolution, but also records the progress of the individual trip. In the centre is a smaller red hand making only one revolution per mile and working on a scale which is graduated in divisions of a furlong—very useful for checking police traps. Messrs. H. M. HOBSON, LTD., also show the Pogon plug, which is adopted by the makers of most of the leading cars, as well as the Bougie switch. This is of great assistance in testing the engine, as the particular faulty cylinder can easily be ascertained in cases of misfiring.

Wind Shields, &c.

A new comer to the show is the firm of Messrs. AUSTER, LTD., of the Crown Works, Hertford Street, Birmingham, who show the "Auster" patent wind shield, Cape cart hood and seat fittings, as well as a great variety of locks, handles, fasteners and all classes of furniture in connection with motor body work. They have a good type of double folding wind shield, the advantage of which is secured by the utilisation of the firm's own patent joints. These enable the shield to be adapted to any angle and to afford ample protection from wind and rain. The firm's Cape cart hood can be drawn into position from within the car, thus doing away with the necessity of various props and other fittings which rather complex the operation of opening out for use. By means of the special joint already mentioned any length of throw can be obtained on one prop and at the same time ample head room is given. Some good types of tilting seats adaptable to any position in the car are also on view, as well as a new door fitting which absolutely ensures the security of the door when locked. The ordinary slam lock is sometimes rattled and opened, but with the new fitting of Messrs. Auster, Ltd., this can be locked by a hooked lock and thus effectually secured.

The Coventry Simplex Motors.

THE COVENTRY SIMPLEX ENGINES, LTD., are exhibiting one of their latest type six-cylinder engines at the stand of the Easton Motor Company. This is a very interesting production, the cylinders being cast in pairs with the valves arranged all on one side. The cylinder dimensions are 3½ in. bore by 3½ in. stroke; 25-h.p. being developed at a speed of 1,500 revs. per minute. The company's own type of automatic carburettor furnishes the mixture, a feature of this device being that the jet can be readily dismantled, and that an air dashpot is provided in connection with the automatic air inlet. A neat arrangement of inlet pipe is adopted to insure an equal supply of the mixture to each cylinder. The main shaft is made from a solid forging and runs on ball-bearings, while the cam shaft is arranged so that it can be readily withdrawn. Provision is also made on the base chamber for the fixing of the water circulating pump and a magneto. A high tension distributor is fitted in conjunction with the contact maker, this being located at the upper end of a vertical spindle driven by bevel gear off the half-time shaft. Throughout there is evidence of the engine having been carefully designed and well constructed.

Elastes.

In a recent issue we illustrated and described the moveable flange rim brought out by the ELASTES COMPANY, LTD., of 79 and 80, York Street, Westminster, W.C. They have the device in operation at the show. As we have previously explained, the new rim consists of an ordinary wheel made with a slightly deeper wood felloe. An ordinary metal pneumatic tyre rim with one bead cut away is affixed to this, and when bolted up on the wood felloe the flange completes the bead cut away. A rubber washer is sunk into the wood felloe underneath the flange so as to prevent wet getting in and damaging the cover. The introduction of this rim has made it possible for the Elastex Company to fill with their speciality any tyres which are in fairly good condition. This should extend the operations of the concern, as hitherto only new tyres have been dealt with. The rim can be fitted in about a week, a week longer being required for filling tyres with Elastex. Samples of

Elastex filling are also to be found on this stand. This has been considerably improved from the earliest introduction, and both the resilience and toughness have been increased, with consequent advantages likely to be appreciated by those who have given attention to the merits of this method of abating the worries associated with tyres when on the road.

Jacks, &c.

Messrs. LAKE AND ELLIOTT, who are well identified with the business in jacks, show various types for motor-cars, including an important motor jack, with spinning nut quick adjustment. They have brought out a new type known by the letter H. This has a remarkably quick adjustment and easy lift. The top is simply lifted to the height of the axle and the jack closes automatically when the large collar is slightly raised. The nuts are controlled by a positive motion which renders it impossible for one nut only to be engaged. The easy lift is obtained by the use of a large ball-bearing to take the thrust. A notable feature of the new jack is the excellent workmanship, which is of a higher grade than is often associated with such devices.

Motor Tools.

Messrs. BENEFINK AND COMPANY, LTD., the old-established firm in Cheapside, whose acquisition by Messrs. Gamage, of Holborn, has lately taken place, are represented in the gallery by a full range of various classes of tools for use by motorists. Quite an utilitarian exhibit of cleaning requisites for service in both public and private garages is also made, and in this connection we may mention the safety lamp for such establishments which has been placed upon the market by Messrs. Gamage and is shown at this stand. The motor department of Messrs. Benetink has been thoroughly overhauled, and evidently the Cheapside house is now well able to do for motorists in the City what the Holborn house can perform for motorists anywhere.

The "Atlas" Jack.

Messrs. BROWN BROTHERS have a good selection of motor accessories, and their display will be of interest to motorists generally. Among the specialities on their stand is the Atlas pneumatic jack shown open in Fig. 55. The speed of operation as well as the ease of the lift are points in favour of this speciality, which is well designed for practical efficiency. Having attached the pump, the jack is placed under the car, care being taken to see that the release valve is securely screwed on to its seat. A few strokes with the triple pump will lift the heaviest car; when lifted one or both pins are put in for safety. To lower the jack the pins are drawn and the thumb screw released gently. In addition to their jack Messrs. BROWN BROS., LTD., have several other special exhibits, including the Gabriel horn and a full range of motor accessories they have marketed under the name of "Duco."

Fig. 55.

These include jacks, lamps, horns, valve springs, levers, &c., the main features of which have been duly set forth in our columns when introduced. In connection with the Atlas jack a triple pump is being recommended, with four strokes of which the jack can be raised to take any car. The importance of carrying efficient tools of this class is recognised by Messrs. Brown Bros., whose "Duco," Nos. 1 and 3, have distinctive merits of their own. The first-named is made of malleable iron with case-hardened gearing, which has an instantaneous adjusting ratchet bar enabling it to be extended by hand in order to bring it instantly in contact with the car. This ratchet bar is also instantaneously released, and telescopes itself into the raising part of the jack by extending (with the fingers) the two round head pins. The telescopic principle of this jack gives a great lift, making it especially suitable for workshop use. The lifting action is quick, and is performed with a minimum of labour, the knuckle joint in the handle obviating the necessity of stooping when working the jack. The "No. 3" Duco jack is fitted with a patent universal hand joint.

Moebius Oils.

Many specialities in motor oils of good quality will be seen on the stand of Messrs. MOEBIUS AND SON, of Howard Road, Stoke Newington, N., whose exhibit includes a wide range. Here is the well-known "Moebius" special "Challenge" motor grease for gear boxes, gear cups, &c., as well as those of the same brand for air or water cooled engines. The "Challenge" motor oils are put up in quarts, half gallons, and gallons as well as in the firm's own patent lubricating can. During many years Messrs. Moebius and Son's oils have been winning a well-deserved reputation amongst practical motorists.

Ignition Specialties.

At the stand of Messrs. THOMSON-BENNETT, LTD., will be found an excellent selection of ignition specialities, including a new High Tension distributor. In this the current is taken from the single coil through the lid by means of a carbon brush pressing on the revolving insulated cam, and thence distributed by a second carbon brush to the several contacts in the outer casing. The brushes make actual contact and there is no jump spark. In advancing and retarding the Low Tension portion is the only part that moves, the High Tension part remaining stationary. This obviates the breaking of wires which so often occurs. Such arrangement is secured by fitting the Low Tension apparatus on

a second base plate which moves for the advance while the main body remains stationary. As the Low Tension circuit is broken before the High Tension there is no burning of the carbons and altogether this new type is a great advance on much previous practice. The Thomson-Bennett single trembler four-cylinder coil has a special feature in the fact that there are four units, each of which is detachable without any tremblers. These contain the separate High Tension Windings. In the central position is a fifth unit with a trembler fitted to it and containing an Auxiliary Primary Winding and a Condenser. These are held in position by a plated bar across the front which at the same time makes the common connection between them. But for the fact that one trembler does all the work the Coil is wired up exactly as a four trembler type would be. Messrs. Thomson-Bennett, Ltd., are guaranteeing the device for twelve months. Many other specialities in ignition are also worthy of inspection on the stand of this well-known Birmingham company.

Ball Bearings.

Messrs. LUDW LOEWE AND COMPANY, LTD., of Farringdon Road, Clerkenwell, E.C., have become so familiarly associated with the D.W.M. ball bearings that mention of their name is almost sufficient clue as to the exhibits at their stand. This year, however, they show an alternative type with solid ball cage which will be of considerable interest to the motor trade. In the D.W.M. Patent Ball Bearings, the ball races are perfectly continuous, there being no lateral grooves or inserted pieces to affect the smoothness of the running, or cause deterioration. This type of bearing, with its individual spring separators, is well known, but the alternative type has only just been introduced. In this the balls are held in a patent cage made of a single piece of bronze. There are no screws or rivets to become loose, or springs to weaken, while the bearing is able to withstand a greater overload. The new bearing, which is illustrated in Fig. 56, has been subjected to severe tests, and as a result can be recommended for motor-cars. It is made to the same dimensions as the older type. Among the other interesting exhibits shown by Messrs. Ludw Loewe

Fig. 56.—The D.W.M. Ball Bearing with Solid Ball Cage.

and Company, Ltd., is a registering caliper for inside and outside measurements. It is graduated on both sides, giving exact readings in inches and millimetres. Another tool serving several purposes is the centre marker, which automatically locates the centre of any section of material. Mention may also be made of the new pocket speed indicator—a convenient and accurate revolution counter which reads direct up to 10,000 revolutions, and can be set back to zero at any time. It can be used for either left or right running spindles, and, like the other tools referred to, can be regarded as thoroughly reliable.

Doherty Radiators.

Radiators play an important part in the good appearance of the modern automobile, and the DOHERTY MOTOR COMPONENTS, LTD., have an especially attractive show in this department. They have been favourably identified with the manufacture of radiators for many years, and on the present occasion show a new type in which the honeycomb radiator is admirably imitated in a way that gives strength as well as lightness. In this a flat vertical brass tube is fitted with corrugated sheets placed on either side so arranged as to give the diamond appearance in front, the gills not being threaded but simply laid along the brass tube. Bonnets, silencers, wings, lubricators, &c., form an important section of the company's display, and attention may well be drawn to a new spare tyre case made in sheet metal capable of being fitted in any position on a car. This case is made in three pieces, the lower semi-circular half being in one, and the upper portion being in two parts, so that it can easily be removed to insert or take out the tyre. The case is absolutely dust and weather proof as well as light-tight. A new carburettor is being brought out by the firm, to which we hope to refer in detail on a later occasion. The Doherty Motor Components, Ltd., are also introducing a new improvement in magnetos, which, however, could not be got ready for the present show, but which should attract further attention to this enterprising concern ere long.

Brooks' Bands, &c.

Messrs. J. B. BROOKS AND COMPANY, LTD., whose name has been well to the front with their non-skid puncture-proof tyres and bands, make an excellent display of their specialities in this department. An important feature of the bands is the patent stud with hardened steel inset

head. This is not merely a case-hardened head but of special dead hard steel, and is designed to obtain a hard wear resisting surface whilst yet retaining the necessary softness in the shank for riveting. Messrs. Brooks and Company make a large show of spare tyre wrappers which are dust-proof and impervious to wet. They enclose the tyre without wrinkling and can be easily fitted with one hand within half a minute, their removal being equally rapid. These tyre wrappers and the firm's circular bags to fit within spare tyres are being made in all colours to suit the upholstery of the car. Patent tool and spare part cabinets, motor tool kits, and motor tourist luncheon and tea outfits are included in an excellent display. A new idea in trunks to fit on the grid of the car is shown, in which two trunks are placed one on top of the other and yet the contents of the bottom trunk can be removed without having to remove the upper one. This is effected by the provision of what is practically a door to the lower device and which is withdrawn to get at the contents. Either trunk can also be employed as a separate convenience.

Engelbert's Oils.

Important in connection with the running of the automobile to its greatest advantage are the oils and greases used in the lubrication of the various parts. Some motorists have not always paid full heed to the necessity of adopting a high-grade oil in this connection until experience has shown the folly of carelessness. In the selection of the oil that is to be employed the reputation of the makers counts for much, for scientific knowledge as well as commercial acumen is essential to the production of the right oils for the right purpose. For the past half century Messrs. Engelbert and Company, 119-125, Finsbury Pavement, London, E.C., have been favourably known as makers of high grade lubricating oils, and when the motor-car began to run on British roads they applied their previous knowledge of engineering requirements to the introduction of oils for the new power. These were supplied to the trade and have enabled many a firm to extend its connections owing to their good qualities and unfailing uniformity. Now, for the first time, Messrs. ENGELBERT AND COMPANY are exhibiting their own productions under their own name, and the attractive cans in which their specialities are sent forth should rapidly become familiar objects in both public and private garages. The motor oil is supplied in gallon and half-gallon tins, as is also an air-cooled motor oil, a gear oil and an oil specially prepared for steam cars. Motor grease is also on view, and the display, which indicates the firm's new policy, should be justified by success. They will also continue to supply to the trade, but private motorists will be mainly interested in this development.

Bowden's Specialities.

The E. M. BOWDEN'S PATENTS SYNDICATE, LTD., have a large assortment of the various useful motor accessories and specialities manufactured by them. The Bowden wire mechanism is on view to demonstrate how power can be transmitted round a corner without having recourse to angle levers and similar devices. The value of a petrol strainer on the fuel pipe is generally accepted, and a new model of petrol strainer will be found to have several features of special interest. There is also shown a new "Automatic Hand Regulated Air Inlet," a long title fully explaining the article referred to; a new exhaust cut out in two sizes, and an improved Bowden Carburettor Agitator which can be adjusted and fitted by any motor mechanic. The exhibit also includes specimens of such well-known Bowden fittings as the Bowden Patent Mileage Recorder, a dashboard positioned recorder which dispenses with the usual flexible shaft transmission; the Bowden Gas Throttle, to regulate the supply of gas to a nicety, and the various Bowden controls for cars. Then there is a variety of motor brakes, including the much-discussed front wheel braking system and a full range of levers for hand and foot for use with the Bowden mechanism, including the new Bowdenloc Lever, a self-locking lever specially designed for use with the Bowden wire mechanism. "Miraculum," the new puncture sealer and rubber preservative now marketed by the Bowden Syndicate, is being demonstrated daily during the Show.

Timber.

Messrs. JOSEPH OWEN AND SONS, LTD., are showing all the materials in timber used in the construction of motor-cars, motor-omnibuses, and automobile vehicles generally. At their stand are samples of oak, birch, mahogany, walnut, canary whitewood, and yellow pine, in planks, boards and panels as required for framing and general body work. Their bent timber exhibits include single and double tonneaus, front seats, front and hind wings, hood sticks, and every description of rails. In wheel wood they also have hickory bent rims, ash felloes and treads, sawn and cleft oak and hickory spokes, dressed and in the rough. A special section of the display consists of mouldings for wind screens.

Motor Frames.

The importance of the frame in connection with motor-cars is too well recognised to need emphasis on the present occasion. Everyone knows that Messrs. RUBERY, OWEN AND COMPANY have become well identified with this section of the industry. They make a good show of their hydraulically pressed and rolled channel motor-car frames. Specimens of pressings used in the manufacture of these are also shown, together with rolled channel angle and tee sections. Their pressed sides and cross-bars can be made in mild or three per cent. nickel steel. The firm are making these frames for motor-omnibuses, motor-wagons and industrial as well as pleasure vehicles, and in addition to the separate exhibit in the gallery their productions will be found on many important stands on the ground floor.

(To be continued.)

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-33, Charing Cross Road, London, W.C.]

MR. EDGE'S CHALLENGE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—On October 14th I endeavoured to clear up the state of confusion into which the various challenges between Mr. Edge and myself appeared to have got by making it perfectly clear that I never accepted Mr. Edge's original challenge because of the very elementary reason that the conditions attached to his challenge would have debarred my fastest cars from competing. I then made Mr. Edge a very definite challenge which could not possibly be misunderstood, in order to induce him to really show that he was desirous of fixing up a race between us.

I do not know that anything could have been simpler or fairer than the offer which I made him, viz., to waive all conditions whatsoever, and to race him for a stake of £5,000 for a one mile race to be held in England, the fastest car to be the winner, and the issue not to be confused by any such absurdity as petrol consumption. I also offered Mr. Edge, if he was willing to run the race in France, where it would

MOTOR-BODY DESIGN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, "Common Sense," certainly brings forward in the *M.C.J.* of the 2nd inst. some strong arguments in favour of the tonneau seated body over one class of side-entrance body, and I cannot but think that his experience of the side-entrance car must have been confined to that class of vehicle turned out at a low figure, where the study of outline and comfort in a body is a minor consideration.

His remark as applied to the private omnibus or wagonette is a question of stresses and draught which has to be studied to a nicety by the coachbuilder in all horse-drawn vehicles, but where the question of ease of ingress and egress is brought into consideration, as, for instance, the ladies' town carriage, the brougham and landaulet with the side doors has always held the first position. Where it is possible to describe a complete circle with a 9 ft. 6 in. or 10 ft. wheel-base car in a roadway 32 ft. or 34 ft. wide, it cannot be said that

Queen Margherita of Italy on her latest Itala Car—a luxurious 80-h.p. Six-Cylinder Vehicle.

have been possible to have a straight two miles, to give his car a start of one hundred yards. I think the above conditions surely prove that I was anxious to arrange a short distance race.

In regard to the long distance race, Mr. Edge knows as well as anyone that it is impossible to arrange a long distance road race unless it is to form part of some big International race, and as there appeared to me to be a very simple method of settling the question of the long distance race, I agreed to take the three Darracq cars entered in next year's Grand Prix against the three Napier cars which Mr. Edge has stated he intends to enter, for a stake of £5,000 a side. There could be no fairer test of the qualities of a racing car than to abide by the result of the French Grand Prix, which is admittedly the principal racing event in Europe.

I now would like to state that the only letter which I have received from Mr. Edge in reply is a reiteration of his previous offer to race me for one mile on petrol consumption. What possible interest there could be in a mile race which was not to be won by the fastest car but by the car which used the least petrol it is impossible for me to understand, nor do I think that anyone can be expected to treat such a suggestion seriously. As Mr. Edge apparently has no intention of meeting me in either of the two races in which I have offered to meet him, and is not content to settle once for all the question of whether the Darracq or the Napier has the best claims to be considered the fastest racing car, I must now inform him that I withdraw entirely from any further correspondence or negotiations in regard to any question of a race between us.—Yours truly,

A. HUNTLEY WALKER.

the car is unduly awkward, and if, as your correspondent remarks, there have been fatal accidents that can be attributed to the length of wheelbase of a car in negotiating sharp corners, then the only cause of same is that the car or cars must have been driven at excessive speed around such corners.

"C. S.'s" remarks that side-entrance doors always rattle after a few months' use convinces me more than ever that his bodies must have been of the cheaper class of work and could not have been designed and built by the man whose knowledge of draughts, &c., in vehicles would ensure his fitting a deep door in such a manner that it would divert any current of air caused by the front of car rushing through the air, and prevent same from entering the back of car.

The "delightfully handy side baskets" which chafe the paintwork of the panels and form such a harbour for dust in the wickerwork can easily be compensated for by the long dust-proof tool boxes that can be fitted under the side steps, the tops of which can be utilised for the conveyance of luggage which has to be sent in advance by rail when touring with the tonneau car.

Surely, with all the latest electric and tell-tale lamps on the market to-day, there is not the necessity of occasionally peering over the back of the car to see whether the tail light is lit or not. It has just been argued that the type of car with the driver's seat enclosed is not ideal for driving in traffic, for the reason that, being so free from noise, overtaking traffic cannot be heard, therefore rendering travelling unsafe. No properly closed-in body should produce the drumming noise that "C. S." rightly complains of with this class of car.—Yours truly,

F. G. NORMAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is now a good deal of talk about luxurious carriage design. If this means luxurious riding over rough roads, and not merely luxurious upholstery, which is comfortable to sit on while the car is at rest, then there is just one way of securing it—suppress the bonnet. The advantages and disadvantages are so very obvious, and the monstrous six-cylinder bonnet has brought them so palpably before people. There are cars costing great sums of money, in many cases owned by people who not only do not drive themselves, but have no inclination to do so, which have all the appearance of having been designed specially for the benefit of the engine, or, at the most, for the driver alone. Taking the space from axle to axle, say 10 ft. 6 in. as a fair average, the bonnet takes up 3 ft. 6 in. to 4 ft., and even on some six-cylinder cars almost 6 ft., the driver's seat, say 3 ft. 6 in. to 4 ft., leaving, at the best, 3 ft. 6 in. for that apparently most unimportant person, the owner. Obviously the owner and his friends cannot squeeze into that space, so the body is prolonged, say, two or three feet beyond the back axle. The owner naturally demands that his carriage shall not be an unreasonable height from the ground, at the same time the wheel must not be too diminutive, so the body and the back axle come rather close together. As a result, stiff springs must be used, or the two will bump together. So here is the unfortunate owner sitting perched over his back axle on a pair of over-stiff springs. The result is great discomfort from road shocks, followed by fatigue.

As we have said, there is only one remedy—do away with the bonnet, and carry forward the body, so that the back seat is well in front of the back axle. We do not think there are many ways of doing this. It has taken us five years to perfect our own method. There is not much doubt about the result, judging by the letters we get, and

Mr. Paul Meyan at the wheel of the 40-h.p. De Dietrich Car which took the first place in its class in the recent Speed Trials at Evreux. The vehicle, as will be seen, is provided with a novel covered body, and weighs, in running order, just over two tons. Notwithstanding this the car covered the kilometre in 40 sec., equal to a speed of about 56 miles an hour.

we have succeeded in getting the comfort without sacrificing power or accessibility or mechanical efficiency.—Yours truly,

NEW ENGINE (MOTOR) COMPANY, LTD.
J. C. MORT, Director.

INLAND REVENUE METHODS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The experience of one of our members a few weeks ago in Scotland will probably be interesting to your readers, as showing the length to which the Inland Revenue are prepared to go when a motorist is concerned, and the discourteous and indeed outrageous manner in which they enforce their demands.

The member in question, Mr. W. P. Cairnes, of Drogheda, a very well known gentleman, when in Scotland a few weeks ago shooting, received an enquiry from the Inland Revenue office, as to whether he held a licence for his man, motor-car, and dogs, brought with him from Ireland. To this he replied:—

Sept. 28th, 1907.

"Sir,—In reply to yours of 24th inst., my residence is in Ireland, and my dogs are licensed there. I am only a visitor in this country for a few days, and never heard of a case where licences, such as you mentioned, were required under such circumstances.—Yours,

(Signed) W. P. Cairnes."

Not having received any reply, and being quite ignorant that such duties could be enforced against a temporary resident, Mr. Cairnes naturally thought the official was satisfied with his reply, that as he was not a resident, no claim existed, when a fortnight later, to his great amazement, he was without warning served with three summonses,

claiming penalties amounting to £451. These were settled by a payment of £8 11s. duty, and 15s. costs.

Whether the department were, under the circumstances, legally entitled to enforce payment of a full year's taxes from a visitor who unwittingly brought a motor-car into the country to use for a few days in connection with his shooting is not my object here to discuss, but I think the quite unnecessarily high-handed and discourteous manner of levying this unjust tax, and serving summonses without any previous demands, should be brought to light, and that if this is the method officials are directed to adopt with visitors to the country, the sooner the directions are altered the better.—Yours truly,

H. S. CHAYTOR.
Secretary of the Irish A.C.

TROUBLE WITH BRAKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad of your advice as to what I could do to the brakes of a 12-16-h.p. car; it is chain-driven and brakes consist of expanding metal-to-metal (actuated by foot) bands inside drums on the rear-wheels and leather-lined bands worked by side lever outside the same drums. The brakes seem to bind—I think it is the outside ones—and cause the car to lose power, this being especially noticeable on hills, when the car comes back much quicker than it should. I have let them out as far as I can to be effective and jacked up the rear wheels and find they will run freely forward, but give a droning sound and bind on the reverse. I find them hot, too, after a run; the outer ones are in the last hole connected to rod, so that they cannot be let out more. Moreover, they are not nearly so effective with full load up, the side lever going right down before the brakes come on, whereas with three up it only goes about half-way. Should that be so, or is it the fault of the springs, or what? Would the compensating rod be the cause, as by putting the side lever hard on I can turn one wheel a little while the other is immovable?—Yours truly,

J. H. H.

[The trouble experienced by our correspondent would appear to be due to the "give" of the springs causing the brakes to be tightened when travelling; this is often the case on cars fitted with light springs at the back. The levers being fitted to the frame and the brakes to the axle, the give of the springs causes the brakes to be drawn on, this being usually more noticeable when the car is running light.]

BENZOLE AS FUEL FOR PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been running my 12-h.p. Lanchester with a wick carburettor on benzole now for about two months, and am just finishing my second fifty-gallon drum. Before I started using benzole I ran this car 36,000 miles on petrol, so that I can judge the difference, and shall never use petrol again as long as I can get benzole. I have now done over 3,000 miles on it and have made no alteration in any respect to my engine or carburettor. It is as clean as petrol, the engine running cooler on it, much sweeter smelling, and does not soot up the plugs or valves, and the engine starts up from cold as easily as with petrol.

It seems to me that the superiority of benzole as a fuel for internal combustion engines is that the explosion is of a more expansive character, following up the piston throughout the stroke, and this is seen by the remarkable improvement in hill climbing. I buy my benzole from the Staffordshire Chemical Company, but the difficulty is to get it when away from home, and it seems a pity that dealers do not stock what is now becoming recognised as the best and cheapest motor spirit.—Yours truly,

JAS. CADMAN.

THE LIVE AXLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It seems a curious fact that there are still many people who seek to decry the merits of a properly designed live axle system. As one of the earliest constructors to apply this excellent form of driving gear to the motor-car I cannot understand how any really unbiassed man of experience is content to uphold the chain drive. At the present Olympia show practically every maker stages live-axle cars, and this is true whether they are British or foreign. A few at present supply chain-driven vehicles, but, if I may venture a prophecy, this kind of construction will become obsolete in less than a year's time. Some talk of torsional strains in the live axle, others of its weight, while a third section points scornfully at right-angled transmission. These absurd notions are often fostered by "motoring experts," and it seems to me that such gentlemen might study with advantage the pages of your journal before they commit themselves to such extravagant ideas.—Yours truly,

E. H. OWEN.

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If "Novice" sees that his contact makers are set exactly equal, also that the inlet springs are of the same strength (to test these put them on the valves, place on a tube, they ought to compress with a 4 oz. weight) he will find his engine pull all right. Is the float behind the carburettor? Sometimes the valves, being so light, will stick on their seats, so he must be careful not to over-lubricate.—Yours truly,

E. W. TABOR.

CLUBS AND ASSOCIATIONS.

MOTOR CLUB.

THE committee of the Motor Club have secured No. 6, West Kensington Gardens, in close proximity to Olympia, which will be open during the show period as a branch of the Motor Club. Everything necessary for comfort and convenience has been provided, and the committee are anxious to see if their enterprise will be so appreciated by their town and country members as to justify arrangements of a similar nature in future years.

SOCIETY OF MOTOR MANUFACTURERS AND TRADERS.

ON Friday of last week Mr. E. Manville, M.I.E.E., President of the Society of Motor Manufacturers and Traders, Ltd., presided at the Grand Hotel, Trafalgar Square, London, at a dinner of the society. Among the company present were the Lord Mayor, Lord Montagu of Beaulieu, Sir Albert Rollit, Sir John I. Thornycroft, Major Eustace Jameson, Mr. Roger Wallace, K.C., Mr. C. D. Rose, M.P., Mr. E. Powell, Mr. Chas. Jarrott, Mr. G. du Cros, Mr. A. W. Gamage, Mr. J. D. Siddeley, and Mr. J. E. Thornycroft.

The loyal toasts having been honoured, Mr. C. D. Rose, M.P., submitted the toast of "The Motor Industry and the Society of Motor Manufacturers and Traders." He commented upon the rapidity of the development of the motor-car to its present state of excellence, which encouraged the hope that in the near future the production of cars which were noiseless, smell-less, and dustless, would relieve motorists of that measure of odium which now attached to them and their pursuit. In view of the legislation that must take place in the course of time there must be no cleavage or hesitation in their ranks. In the past legislation had been more or less of a tentative nature; in the future it would be permanent, inasmuch as it would be based upon known facts.

Mr. E. Manville, in the course of his response, referred to the valuable work which the society was doing in the development of the motor industry. During the past year the basis of the society had been broadened so as to include agents throughout the country, and a scheme for the establishment of local centres was being carried out so as to consolidate all interests, and as a practical effort to stop objectionable trade practices. A meeting of agents from all over the kingdom would be held at Olympia during the exhibition, at which it was hoped arrangements for the formation of these local bodies would be completed. The trials of commercial vehicles held by the Royal Automobile Club, assisted by the society, had proved an unqualified success, and had proved the absolute superiority of mechanical traction over horse haulage for commercial purposes. As to the future, the society in collaboration with the Royal A. C. were preparing for the great event of 1908, the touring car trials, which were to extend over 2,000 miles, including hill climbing competitions and a speed trial to finish on the Brooklands track. He hoped the success of this event would be unparalleled, and would render it unnecessary to look abroad for the most important trials. The exhibition at Olympia was cosmopolitan and international. He was glad to be able to add that steps were being taken for the establishment of a benevolent fund for the benefit of persons dependent upon the industry. He was not yet in a position to go into details, but it could be taken as resolved that such a fund would be formed, either by the society alone, or in conjunction with another body.

In conclusion Mr. Manville referred to the services to the society of Mr. Sidney Straker, president three years in succession, to whom on the part of the members he made a handsome presentation.

The toast of "The Guests," proposed by the Chairman, was responded to by the Lord Mayor, and Lord Montagu of Beaulieu gave "The Chairman."

NORTHAMPTONSHIRE.

THE Northamptonshire Automobile Club held its first annual dinner at Northampton last week under the chairmanship of Sir Thomas Hesketh. Earl Russell was one of the guests and proposed the toast of the club.

The speeches of the evening were devoted in the main to a discussion of the future of the motoring industry, dust, and other problems, and the prejudice felt against motorists. Compliments were paid both to the general condition of the county roads and to the administration of justice.

HEREFORDSHIRE.

AS a large amount of correspondence still continues to be sent to Mr. Wilfred Groom as secretary of the Herefordshire Automobile Club, he asks us to remind readers that he left Hereford some months ago. In fact, immediately after Frome's Hill climb he took up the managership of the Edinburgh branch of the Car and General Insurance Corporation.

Communications with the Herefordshire A.C. should be sent to Mr. A. Townsend, High Town, Hereford.

THE AUTO-CYCLE CLUB.

It is difficult thus early to write much concerning the Tourist Trophy race for motor-cycles next year, but it is to be expected that it will be even better supported than that of 1907. That motor-cycling has benefited by this year's competition is undeniable, and many improvements in machines that will be exhibited at the Stanley Show can, in the official view of the club, be traced back to the Tourist Trophy Race of 1907.

AUSTRALIA.

THE Automobile Club of Victoria held the opening meet of the season on Saturday, October 5th, at the "Speedway," Albert Park, Melbourne, about 100 cars turning out. Refreshments were served to members and their friends in a marquee, and afterwards a run of sixteen miles was made to Wordingalloe, where dinner was served at 6.30 p.m.

THE Victoria Motor Cycling Club held a ten mile road race on October 5th, the winner being Mr. A. J. Scarsebrook on a 3½-h.p. Peugeot. Fastest time was made by Mr. W. Jenkins on a 7-h.p. Peugeot, equalling fifty-three m.p.h.

THE Automobile Club of Australia (Sydney) held their annual hill climb on September 28th on the Artillery Hill, National Park, about 120 cars being in attendance. Out of twenty-nine entries the winners were as follows:—

Four-cylinder Class.—Alderman Allen Taylor, 24-h.p. Minerva. Time, 2 min. 1½ sec.

Two-cylinder Class.—Mr. J. O. Fairfax, 10-12-h.p. Swift. Time, 3 min. 21 sec.

Mr. C. H. Kuan, B.A., M.E., of Canton, being instructed in motor-car driving at the National Motor Academy, Notting Hill. He was the first Chinaman to obtain the Royal A.C. certificate for mechanical efficiency.

Single-cylinder Class.—Mr. J. Lawler, 6-h.p. Wolseley. Time, 4 min. 34½ sec.

The distance was 1,320 yards, and the grade varied from 1 in 20 to 1 in 6.

MR. D. F. GODDARD, M.P., of the Ipswich and East Suffolk A.C., has been knighted.

A MEMBER of the Bristol and Gloucestershire A.C., Sir Herbert Ashman, has been created a baronet.

THE West Essex Automobile Club has concluded a very successful season, and at the annual dinner, to be held at the headquarters at Seven Kings (Essex) on January 9th, 1908, medals and trophies to the value of about £50 will be presented to the winners of the various competitions held since April last.

AN UNLUCKY RIDE.

THE charges against two young men of stealing a motor-car, which was recently wrecked by collision whilst travelling through a street at midnight have collapsed at Bristol Police Court. It was alleged they broke into the garage of Mr. D. W. Bullock, of Clifton, drove the vehicle dangerously, and damaged an electric standard, against which the vehicle came to a standstill. Detective-Inspector Tanner now said he did not propose to offer any evidence against defendants, who were discharged. The two men say since they were walking on Clifton Down when an acquaintance driving a motor overtook them and invited them to accompany him on the ride during which the accident happened. The driver, they say, then disappeared, and they also went off, as they did "not wish to be mixed up with any difficulty."

CASES UNDER THE MOTOR CAR ACT.

A DOUBLE DISMISSAL.

On Thursday, the 7th inst., a summons against Mr. Ernest Thorne, tester with Messrs. Legros and Knowles, Ltd., was heard at Kingston. Superintendent Marks conducted the prosecution, and Mr. W. Frampton, instructed by Messrs. Kenneth Brown and Company, appeared for the defence.

The facts of the case were that on the 10th October last, at about 11 p.m., the defendant was stopped near Kingston, and charged with exceeding the legal limit. On the hearing of that summons, although the police swore most positively that the defendant was driving at a rapid rate and far beyond the legal limit, it was proved that this was wholly inaccurate, that inasmuch as the defendant only had small paraffin lamps on the car it would be almost an impossibility to drive at the speed suggested by the police, because the driver would be unable to see, and on many points the police differed in their evidence, with the result that the summons was dismissed. During the cross-examination of the defendant by Superintendent Marks he obtained (*inter alia*) a statement from the defendant that the chassis, which had a general identification number, was not used on trial and the Clerk of the Court was asked to make a note of this. The result was that the police, although the summons for driving at an excessive speed was dismissed, issued a further summons against the defendant for driving an unregistered car. In cross-examination Superintendent Marks denied that the defendant said he was testing the car, and was taking a radiator to Brooklands. The defendant gave evidence, as also did the chief tester of Messrs. Legros and Knowles, Limited, Mr. Sparrow, to the effect that the chassis was being tested with a number of persons on board, and that a radiator was being taken to Brooklands at the same time for the purpose of being attached to another car.

Counsel submitted on behalf of the defendant that the summons must be dismissed. He deplored the methods adopted by the police of

A Metamorphosis at the Show.

Le Rire.

extracting admissions from a witness under cross-examination, and issuing another summons stating that the whole of the evidence given by the defendant on the previous occasion had not been taken down but merely the words that the car was not used for trial purposes, although the defendant added that he was out testing it. The defendant was under the impression at the time that trial purposes meant with an intended purchaser. Counsel further submitted that it made absolutely no difference whether there was one man or ten men on the chassis, or whether the defendant was taking a radiator or pulling another wagon, the primary object was the testing of the chassis, and the Act of Parliament was perfectly plain, and that it was most unfair of the police to work up a case in the way this one had been attempted against the defendant, and he suggested it was pure spite because the first summons had been dismissed.

The Bench after consultation dismissed the summons.

HEAVY HAULS.

Several batches of motorists have lately been before the magistrates at Coventry, Kingston and Grantham, with the usual result. At the Spittlegate (Grantham) Petty Sessions an aggregate of £100 has just been gained for the borough fund in fines on motorists.

THE THIRD TIME OF ASKING.

In Dundee Sheriff Court, William Sim pleaded guilty to two contraventions of the Motor Car Act by failing to have the tail lamp of his car lighted, and refusing to stop when requested by the police. The Fiscal reported that the policeman, who noticed the tail lamp out, whistled to Sim to stop, but he paid no attention. This officer signalled to another further on, and he got on to the middle of the road, whistled, and held up his hand. Accused responded by sounding his horn, and circled round the policeman, and made off. A third officer was apprised, and he succeeded in stopping the motorist. The sheriff fined the accused 10s. 6d. for each offence.

PUBLIC MOTOR SERVICE.

A MOTOR service between Tongue and Wick has been commenced, and the first conveyance of the mails by motor-van has been made in that district of Scotland.

STANDARDISING SCREW THREADS FOR MOTOR-CAR CONSTRUCTION.

A CONFERENCE was recently convened by the Engineering Standards Committee, at the Institution of Civil Engineers, to which were invited representatives from the Royal A.C., the Institution of Automobile Engineers, the Commercial Motor Users' Association, the Agricultural Engineers' Association, and the Society of Motor Manufacturers and Traders. The conference was held with a view of ascertaining how far the series of fine threads laid down by the committee were adapted to the special conditions of design existing in motor-car construction. The chair was taken by Mr. H. F. Donaldson, Chief Superintendent of the Royal Ordnance Factories and Chairman of the Sectional Committee on Screw Threads and Limit Gauges. It might be of advantage if we recalled the fact that three series of threads have been standardised by the committee: 1, British Standard Whitworth; 2, British Standard Fine Threads. 3, British Association.

Some evidence was given by, amongst others, Messrs. Lanchester, O'Gorman, Orcutt, and Godfrey Brewer, and it transpired that for most purposes the existing standard fine threads were deemed suitable for employment in car construction. Mr. Lanchester pointed out that whereas the gradation in the series of fine threads in sizes relating to the strength of the bolts was satisfactory in sizes $\frac{1}{2}$ in. and above, the jump from a 5-16 in. to a $\frac{1}{4}$ in. bolt was proportionally too great and did not allow of sufficient latitude in design. He suggested for the committee's consideration the insertion of an intermediate size. He stated that the screw threads adopted by his firm changed from English to metric pitches at a diameter of 5-16 in., where a convenient relationship existed between these two systems of pitches based on the fact that 8 mm. closely approximated to a diameter of 5-16 in. and he suggested a similar step in the committee's tables. It would appear, therefore, that instead of carrying down the standards to $\frac{1}{4}$ in. before adopting the B.A. metric pitches it would be desirable, at any rate for motor-car work, to make the change at 5-16 in. and to consider the adaptability of this to general engineering work.

Attention was called to the necessity of standardising the thread commonly used on sparking plugs, and which has a 1.5 mm. pitch, since several firms were manufacturing a thread which, though closely resembling this, did not interchange with it.

Mr. Orcutt spoke in favour of the limits laid down by the committee, by the aid of which it was hoped to secure interchangeable work, and referred to the present unsatisfactory state of much of the work turned out by the majority of the bolt and nut manufacturers. To his knowledge, so difficult had one prominent engineering firm found it to secure anything like reasonable accuracy in the bolts and nuts supplied from manufacturers' stock that they were about to institute a nut and bolt department of their own. The difficulty of obtaining reasonably accurate bolts and nuts was confirmed by others present, one member of the committee stating that his firm had already been forced to adopt a similar course to that referred to.

COMPANY NEWS.

DAIMLER MOTOR COMPANY.—The annual meeting of the Daimler Motor Company (1904), Ltd., was held at Coventry on the 7th inst., Mr. Edward Manville presiding. The report showed a disposable balance of £144,395, and recommended a 12½ per cent. dividend on the ordinary shares, in addition to a bonus of 2s. per share, the dividend and bonus being equal to a return of 22½ per cent. The chairman, in moving the adoption of the report, said that the shareholders might regard the balance-sheet as absolutely sound. The available assets of the company as a going concern might safely be taken as exceeding £700,000. Their trade was improving, the number of cars sold this year showing an increase of about 20 per cent. as compared with the sale last year. The report was adopted, and the meeting voted 2½ per cent. of the gross profits to the directors as additional remuneration.

HUMBER, LTD.—Mr. E. Powell presided at the meeting of Humber (Ltd.), and, in moving the adoption of the report, said that twelve months ago he was able to state that the sales of the year then under review were double those of the preceding year, and no less than three times as large as they were during the first year of the company's existence. For the year ended August 31st last they were five times as large as they were in the year 1900. The increase was mainly in the motor branch of the business. As compared with the extent of their present business, the stock as it appeared in the balance-sheet bore a smaller proportion than it did in the average of previous years. It included very few finished cars or bicycles, but was all up-to-date stock, nearly the whole of which consisted of models for 1908, parts of cars, &c., going through the works in the ordinary course. During the coming year several new models would be presented. As to the new works at Coventry, had they had the possession of them during the last twelve months the profit, which was £154,434 against £106,558 in 1906, would have been £25,000, or £30,000 larger. Mr. J. W. Davy seconded the resolution. Mr. Hussey asked if the £25,000 spent upon plant and machinery had been charged to revenue or capital account, and another shareholder asked if the directors would consider the desirability of declaring an interim dividend next year. The report was unanimously adopted, and the additional remuneration voted to the directors at the last annual

meeting confirmed, while a further £1,000 was also voted to the directors for their services during the past year. An extraordinary general meeting was subsequently held for the purpose of increasing the capital of the company by the creation of 100,000 new ordinary shares of £1 each to rank *pari passu* with the existing ordinary shares. The Chairman remarked that they proposed in the first instance to offer the new shares to the ordinary shareholders *pro rata*, and those that were not taken up would be offered to the preference shareholders.

THE CALEDONIAN MOTOR CAR AND CYCLE COMPANY, LTD.—The annual report of this company shows a net profit of £552, which, with the balance of £94 brought forward from last year, leaves to be dealt with £647, which the directors proposed to apply as follows:—In writing off depreciation on plant, utensils, and fittings, being at the rate of 10 per cent. on the cost of the plant at date, say, £80; in paying a dividend at the rate of 10 per cent., free of income tax, £482; and in carrying forward to next account (subject to remuneration of directors) £84 7s. 10d.

S. F. EDGE (1907) (LIMITED).—The statutory meeting of S. F. Edge (1907) (Limited) was held on the 7th inst. Mr. S. F. Edge, who presided, said that 263,058 shares had been issued, and at the present moment only £1,601 remained due thereon. They had made out a balance-sheet for the purpose of arriving at the figures stated in the prospectus, and found that the position up to the end of July was 20 per cent. better than for the corresponding period of last year. A large number of firms had come to the conclusion that big motor-cars were a mistake, and had determined that they would make small ones, but they were going to be just as badly hit, because that class of trade was extremely well catered for by a few existing firms in this country. The directors believed that with Mr. Napier's six-cylinder principle they had absolutely succeeded. In the past the trouble had been that the expense of producing it had limited their market, but during the past year enormous improvements had been made in the factory, with the result that cost prices—and consequently selling prices—had come down. They had specialised, and he believed that it was only the firms able to specialise who could hope to succeed.

DE DION-BOUTON (1907).—A special meeting has been held, when the chairman (Mr. S. F. Edge) gave particulars of the company's working since the date of incorporation. The chairman said that the profits for the six months ended September 30th last being larger than those of the previous year, the board passed a resolution to declare an interim dividend on the ordinary shares at the rate of 8 per cent. per annum, tax free, and to distribute by way of interim dividend among the holders of the deferred shares a sum equivalent to twice the amount payable to the holders of ordinary shares over and above 7 per cent. per annum. In the past there had been a large number of manufacturers, and they had been able to sell their output to the public, but they would not be so easily able to do so in future. The trade would be taken by a few large houses in France, Italy, Germany, and this country. In the past season this company received from the De Dion factory 500 motor-cars, all of which had been sold. For next season the directors had committed themselves with the factory for 1,000 motor-cars, and the orders in hand were twice as large as those booked twelve months ago. In answer to questions, the chairman said that it was not thought desirable to give the amount of the profits for the six months, but they would be set out in the balance-sheet for the whole year.

A. DARRACQ AND COMPANY (1905) LTD.—Subject to final audit it is announced that the net profits for the year ending September 30th last were about £195,000, giving, with the balance of £40,000 brought forward, a total of £235,000 to the credit of the profit and loss account, and that after payment of a further dividend of two shillings per share (making 20 per cent. for the year) on the ordinary shares, the directors will place £100,000 to reserve, and carry forward a balance of about £27,000.

FIAT MOTOR-CAR.—Lord Grimthorpe, presiding on Tuesday at the statutory meeting of the Fiat Motor-Car Company, said that in the organisation of a business such as the one they were now instituting there was a large amount of preliminary work to be gone through. In this connection he might mention the able and useful work which had been performed by Sir William Bell. In the prospectus it had been stated that negotiations were in progress with a view to a contract being made for a garage and for the maintaining of the company's cabs. These had resulted in a contract which secured for the company a magnificent garage at Thames Bank Wharf, near Victoria Station. There their cabs would be maintained, and in every respect properly attended to and looked after. They had secured the services as general manager of Mr. F. Henry Fowler, formerly of the General Motor-Cab Company. As to their cabs, under the contract with Fiat Motor (Limited) they had to be delivered by monthly instalments, and they would expect ten cabs during this month; but he was given to understand by Mr. D'Arcy Baker, of the Fiat Motor Company, that twenty-five cabs would be delivered this month. He was also informed that future deliveries were likely to be ahead of the dates specified in the contract. If these terms were fulfilled it was certainly matter for congratulation to the shareholders that the company would be in a position to commence earning money before the time anticipated in the prospectus.

PARTINGTON PNEUMATIC WHEEL COMPANY.—£75,000. To adopt an agreement with Mr. J. Bridgen, to manufacture and deal in resilient wheels for motor vehicles, &c. 838-9, Salisbury House, E.C.

HAVING been unable to obtain space at the Olympia Show, the Star Cycle Company, Ltd., are exhibiting the "Royal Starling" cars at their depot, the Star Motor Agency, Ltd., 16, Upper St. Martin's Lane, London, W.C.

CHAUFFEUR ACQUITTED OF CULPABLE HOMICIDE.

BEFORE Sheriff Shennan and a jury at Danfermline, John Crawford, motor-car driver, Granby Street, Newmarket, has been tried on a charge of culpable homicide. The libel bore that on September 7th, on the Great North Road, between Crossgates and Cowdenbeath, Crawford negligently drove a motor-car, and caused or permitted it to collide with and run over Isabella, wife of Robert Proud, labourer, Woodend, and injure her so severely that she died later in the Danfermline and West Fife Hospital from the effect of the injuries, and that he thus killed her. More than two dozen witnesses were examined. Some of them stated that the car was being driven at a high speed, but others testified that a moderate rate was observed. The evidence generally was of a matter-of-fact nature. It seemed that Mrs. Proud set out to cross the road, when the car came into view, and that, in order to avoid her, the chauffeur ran on to an embankment. The woman was carried along by the motor, and afterwards run over, her injuries being such that she died about two hours afterwards. In charging the jury, the Sheriff asked them to divest themselves of antipathy to motors, and to regard the case simply as a driving accident. The jury returned a verdict of not proven. Counsel for the defence was instructed by Messrs. W. and W. Finlay, W.S., Edinburgh.

> GREATER THAN
< LESS THAN

1. Distance from Dash to Back Axle:—In the case of "curved" or "dished" dashboards, the measurement is to be made from the back of the foremost plane, portion of such dashboard. Cars which so far depart from the usual design as to render the determination of the dashboard's position difficult, or impossible, shall be deemed to have a dashboard 28 in. forward of the front portion of the Driver's seat.

2. In measuring Bodies for Wind Resistance Area, the Mean width at the widest part—usually the back—is to be taken. The height is to be measured from top of frame to top of body including any projecting upholstery. If the frame be bent upwards at the rear end, then the Height is to be taken from the level of top of frame before such upward bend occurs. The bodies contemplated in Table 4 are Open Touring Bodies only.

3. By the "Vertical Projection of the two front wings" is to be understood the Sum of the two rectangles indicated in dotted line in the accompanying sketch. All touring cars are to have as much Wing Area to the rear wheels as to the front wheels.

MALICIOUS DAMAGE.

AT the Saxmundham Petty Sessions, on the 31st ult., at the instance of the Motor Union, Alfred Cook, Ipswich, was charged under the Malicious Damages Act with causing damage to a car belonging to Mr. E. V. Storey, of Caterham Valley, at Blythburgh. Defendant pleaded not guilty. The prosecuting solicitor stated the damage to the car was of little moment to his client, and he would be satisfied with compensation for the damage done to one mudguard, which amounted to £1 9s. 6d. Defendant was fined 5s., costs 15s. and £1 9s. 6d. damage or fourteen days' imprisonment.

FORTHCOMING EVENTS.

NOVEMBER.

- 20th (W.).—Institute of Automobile Engineers. Address by Col. R. E. Crompton.
General Committee of the Motor Union.
22nd–30th.—Stanley Show.
22nd.—The third Olympia Show number of the *Motor-Car Journal* will be issued.
23rd.—Last day of the Olympia Show.
26th (Tu.).—Annual Dinner of the Aero Club at the Savoy Hotel.
30th (S.).—Annual Dinner of the North London A.C. at the Midland Grand Hotel, London.
Last day of the Paris Motor Show.

DECEMBER.

- 2nd (M.).—Cheshire A.C. annual dinner.
5th (Th.).—Exhibition at Berlin.
7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.
Annual dinner of the Hertfordshire C.A.C.
11th (W.).—Southend and District M.C. annual dinner.
Incorporated Institute of Auto. Engineers—Mr. Dugald Clerk on the "Principles of Carburettors."
18th (M.).—General Committee of the Motor Union.
21st (S.).—Opening of the Brussels Exhibition.
26th (Th.).—Annual Reliability Trial of the Motor Union of Western India.

JANUARY, 1908.

- 4th–11th.—Dublin Motor Show.
9th (Th.).—Dinner of the West Essex A.C. at Seven Kings.

FEBRUARY.

- 7th–15th.—Manchester Motor Show at Belle Vue.
12th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
15th (Sat.).—Auto-Cycle Club Annual Dinner.

MARCH.

- 21st–23th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

CLAIM AND COUNTER-CLAIM.

AN action to recover £16 12s. for damages to a motor-car was brought in the Manchester County Court by Mr. William White, builder and contractor, of Sheffield, against Mr. Thomas Wild, carrier, of Gorton. The defendant entered a counter-claim for £12 as depreciation in the value of a horse, £2 as charges by a veterinary surgeon, and £2 for five days' keep of the horse and loss of time in attending to it. After hearing the case, Judge Parry said this was another of the cases in which there was an element of doubt raised by the conflicting nature of the evidence. Either the driver of the dray did not take the precaution of looking up and down the road before leading his horse out or did not look properly, because in that event he could not have failed to see the motor-car. He gave no signal whatever to the driver of the car, and was clearly negligent. There was also the question to be considered as to whether the plaintiff also was not negligent. Under ordinary circumstances he should have been able to pull up as soon as he saw the horse and dray in motion. But in this case it happened that the exit from the goods yard was pointing at such an angle towards Hyde that he thought he was justified in assuming that when the horse actually started moving it intended to go in the direction of Hyde. Then when the carter, instead of doing this, began to cross the road the car driver was thrown into an enormous difficulty; for to avoid an immediate collision he had to decide in a moment whether to try to stop or to gain space by pulling away to his right. He did the best he could by pulling across the road, and there would therefore be judgment for the plaintiff, with costs on the claim, and judgment against the defendant on the counter-claim.

POLICE TRAPS.

ELTHAM Road, Eltham, has now its police trap.
The police in the county of Durham are being urged by the county authorities to more persistent action against motorists.
EWELL is the centre of energetic police trapping just now.
MAIDSTONE ROAD, North Cray, has its motor trap. Victims caught therein are summoned to the Bromley (Kent) Petty Sessions.

POLICE vigilance is being noted at the Wansford cross-roads, near Peterborough.

MANCHESTER ROAD, Bradford, is being well watched by the police, although "traps" do not appear to have been established there yet.

SEVERAL traps have been laid in the neighbourhood of Epsom, notably on the London road, where there is a measured furlong.

SEVERAL police traps are shortly to be established at Beckenham, Kent, at the suggestion of the local Council.

ROAD REPORTS.

LANARKSHIRE.—Messrs. A. Colville and Sons, of Motherwell, N.B., are offering the Middle Ward District Committee of the Lanark County Council a quantity of steel slag for the purpose of testing its value in road repair work. It will be tried on three stretches of 100 yards each.

LINDFIELD.—The Lindfield Parish Council is making application to the County Council for a speed limit of eight miles per hour "for all traffic" cars through the village.

AUTOMOBILE ACCIDENT.

A SERIOUS accident occurred the other day in Kennington. The 40-h.p. Fiat car, belonging to Mr. Seymour Hicks, illustrated in our issue of the 26th ult., was being driven from the Aldwych Theatre to Mr. Hicks's residence at Merstham, when, near Kennington Church, it collided violently with a lamp-post and was wrecked. In the car were Mrs. Hicks (Miss Ellaline Terriss), Miss Barbara Deane, and a maid. The latter was thrown heavily against the side of the car and sustained a bad gash on the forehead. Miss Terriss and Miss Deane, though badly shaken, were uninjured. The car was much damaged.

BUSINESS NEWS.

MESSRS. W. SEARLE AND COMPANY, 33, Glasshouse Street, W., are instituting a competition which will be of interest to all interested in their speedometers.

THE COVENTRY SIMPLEX ENGINES, LTD., Coventry, have appointed the Euston Motor Company, Ltd., 124, Euston Road, N.W., their London agents, who are exhibiting at Stand 164, Olympia.

THE Daimler Company have received an order from the Metropolitan Water Board for a 30-h.p. Stoneleigh limousine car with a wheel base of 10½ ft.

MESSRS. EDWARD WOOD AND COMPANY, LTD., of 88, Cannon Street, London, E.C., send a copy of their catalogue of steel structures, which, doubtless, will be of service to some of the motor firms who may contemplate extensions during the next few years.

WE learn that Mr. A. Hirst has terminated his connection with the Compagnie des Magneto Simms-Bosch, Ltd.

THERE was an error last week in the prices given in the advertisement of the Darracq cars. The price of the 14-16-h.p. car with a short chassis is £335, and £355 with a long chassis, the vehicle in both cases being fitted complete with a standing touring car body.

MR. G. CALLOW, who has been in the business for some years, has taken offices and showrooms at 19, Bride Lane, Ludgate Circus, E.C., from which he is able to supply wire, copper and asbestos washers, coils, plugs and all classes of motor accessories.

MR. G. D. HOWARD is now representing the Non-Skid Tread Manufacturing Company, of Chesterfield Gardens, Harringay, N.

REPAIRS to both covers and tubes of tyres are now undertaken by the Samson Leather Treads and Tyre Company, Ltd., 1, New Burlington Street, London, W., whose non-skids are attracting much notice at Olympia.

WE have recently had a further opportunity of visiting the works of the Acme Rubber and Tyre Company, of 343, St. Vincent Street, Glasgow, and were interested in several important developments of their non-skid. It is one of the most notable non-skids on the market. It contains no leather, and is composed of rubber and steel, every part having a large washer to ensure the same being permanent. The company fit all patterns of treads, and will supply samples of rubber and fabric to those interested.

THE revised prices of the Itala cars were given wrongly in the advertisement which appeared in our columns last week. During the past few days the directors have announced that for the future the prices of the new 1908 models will be as follows:—20-30-h.p. four-cylinder, £650; 35-45-h.p. four-cylinder, £850; 50-60-h.p. four-cylinder, £1,100; 60-h.p. six-cylinder, £1,250; and 80-h.p. six-cylinder, £1,350.

THE BRIGHTON AND SUSSEX MOTOR AND CARRIAGE WORKS, LTD., 18A, Cannon Place, Brighton, have recently carried out a successful alteration upon a 1902 type 25-32-h.p. Mercedes, by lengthening the chassis two feet and building a double landaulet body seating seven in place of the former tonneau. The car has since run about 7,000 miles, frequently with seven or eight passengers, revealing neither deficiency in power nor defects in reconstruction. Two similar cars are now in course of alteration at the company's works.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, NOVEMBER 23, 1907.

[No: 455.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

ON Monday, at the London United Institution, Mr. Eric S. Bruce, hon. secretary of the Aeronautical Society of Great Britain, made some interesting remarks on the subject of aeroplanes. He paid a tribute to the work of M. Santos Dumont, who had made the first flight within a time limit. The aeroplane was simply an old friend—the kite—promoted from a toy to an implement of science, and to be the basis of the modern flying machine. Before man would be able to master the air he would have by his intellect to do what the sea-gull was doing instinctively, and be able quickly to alter his wings and position so as to counteract the disturbing forces which upset the equilibrium of his machine. Where the flying machine failed was in lack of stability to withstand the unseen forces of the air, which threw it off its balance. What was to be done to enable man to conquer the difficulty? He believed they were on the dawn of a new hope in the application of the gyroscope, the rotary motion of which counteracted another motion. Mr. Bruce believed there was a future in the application of the gyroscope to preserve the stability of the aeroplane. Personally, he had greater hopes in the application of the gyroscope than in any other complicated invention that had been brought forward. If it could supply aeronauts with this balancing power would it not be a most striking example of the uses of simplicity?

Instruction in Motor-Car Engineering.

At the last examination of the City and Guilds of London Institute there were 144 students examined, 51 of whom passed. These were from a total of 569 who attended instruction in 28 classes. Commenting on the results, the examiners say it is evident that the candidates who sat for the examination were not sufficiently well acquainted with the rudiments of general engineering to commence specialising in motor-car engineering with advantage. In the ordinary grade this is particularly noticeable, inasmuch as a large percentage of the candidates were unable to express their ideas in rough sketches such as an engineer could easily read. The general standard of the answers given this year is far below that of the answers given last year, and this is, no doubt, primarily due to the insufficient preliminary knowledge to which reference is made above, but, from characteristic mistakes being common to sets of papers, it is manifest that the teaching is also at fault. This is also indicated by the lack of method and order in the manner in which the localisation of the cause of misfiring was

attempted. From the way in which platinum has been called into request for constructing various electrical parts of ignition apparatus it is also clear that sufficiently detailed instruction has not been given to the candidates on the point. Many of the candidates who attempted the question on float chambers fell into the ludicrous error of representing a float chamber ball valve as a common cistern ball-cock, and a number represented the feed pump for a small steam generator as an ordinary circulating pump for the cooling system on a petrol car. On another page we give a selection of the questions that were set.

The R.A.C. and the M.U.

THE intimation by the committee of the Royal Automobile Club to "determine the agreement dated the 20th day of February, 1906, and made between this club and the Motor Union of Great Britain and Ireland," has provided a topic of conversation at Olympia this week. Rumours had, however, previously discounted the effect of the news, and most people merely regarded it as a repetition of what was generally understood would take place. The interest taken in the club by the King has made it very desirable that the parent authority in motoring matters should be above the controversies of the industry—a fact which, perhaps, has had more to do with the severance than has been commonly suggested. The club will now proceed to formulate a scheme whereby, after the termination of the agreement, all the advantages hitherto enjoyed by the Scottish, the Irish, and the provincial clubs, as well as individual members, will be extended to them by the Royal A.C. It is of interest to note that the total membership of the local clubs included in the Motor Union exceeds 11,000, and that in addition the number of individual members is 4,700. The Automobile Association has 5,000 members.

North of the Tweed.

A RECORD has undoubtedly been made in the past season so far as the number of motorists touring Scotland is concerned, and, despite the harsh welcome accorded by the Revenue authorities to those from the Emerald Isle, there have been many motor-cars in the Highlands from all parts of the United Kingdom. The visitors' books at the hotels tell a tale of prosperity, while the activity of the garages and motor repair shops has been really abnormal. Probably the Scottish Reliability Trial has been responsible for some of this favour, the event securing great publicity for the roads of northern Britain as a touring ground. The record of petrol sold in Perthshire is fairly indicative of the great number of motorists who have been travelling that way of late. At Pitlochry, that charming resort near Killiecrankie, three firms alone have supplied 21,000

gallons—sufficient for journeys probably extending 300,000 miles. In the city of Perth itself one agent—Mr. Buchanan Shiell—has supplied nearly as much to motorists. In some village districts sales of 2,500 gallons by small agents are also reported, and at Crieff, which, it must be remembered, is on the road to Oban and the West of Scotland, Messrs. D. Millar and Sons have sold over 25,000 gallons. Figures such as these afford a fair criterion as to the development of motorism in northern Britain.

A Protective Service.

So many accidents have occurred when automobiles have been wrongfully taken from their garages by their drivers without the knowledge of their employers that interest will be felt in a "Protective Service" that has been promoted in the United States for the purpose of suppressing such undesirable, if not dangerous, habits. Practically the work is based upon the plan of the scouts of the Automobile Association in this country, men being appointed to frequent the favourite drives and

The Royal Wedding at Wood Norton.—King Alfonso of Spain on the Duke of Orleans' Renault Car.

resorts of New York and district reporting daily to headquarters the licensed numbers of all cars that appear to be in use without the knowledge and consent of their owners. The idea is proving popular, and its successful operation should secure a material reduction of the repair bill while ensuring a longer life for both car and tyres. It is notable that often when accidents occur here the evidence subsequently proves that the vehicles have been used without the knowledge of the owner, and thus motorists are given a bad name which is largely undeserved. They will therefore appreciate the idea that underlies the Protective Service to which we have referred.

Paris and London.

EVIDENTLY the authorities of the Paris Salon are not unmindful of the advantage of securing the attendance of motorists from this country, and for the first time London hoardings have been brightened with pictorial announcements of the Paris Automobile Exhibition. The fact that two shows in London and Paris are in progress at the same time emphasises

the international character of the industry. It is significant, too, of the eagerness with which the French trade are watching their British rivals that advertisements of their show should have blossomed forth on the boardings of London. But with all the blowing of horns and attacks on our trade the walls of the city will not fall so easily as did those of a historic city in the olden days.

A Sign of the Times.

It is a commonplace saying nowadays that the motor-car will revive the ancient glories of the road and bring back prosperity to the countryside. Its influence is great, and many a wayside inn has been refurbished and made gay again by the coming of the car. Hotel-keepers who have had associations with the horse, and whose prosperity has lain that way in the past, need not regard the automobile as an enemy. Rather should they welcome it as an ally as doth the good host of Huntingdon, who thus proclaims his modernity and enterprise in an advertisement in a local journal:—

W. YARNOLD,
JOB MASTER,
SWAN INN, HUNTINGDON.
MOTOR CARS

AND
POSTING IN ALL ITS BRANCHES
ON MOST REASONABLE TERMS.

Telephone: 0192.

Telegrams: "Yarnold, Huntingdon."

A Presentation.

MONDAY was an important day at the Motor Exhibition, for not only did King Alfonso of Spain visit Olympia, but there was a gathering of participants in the Scottish Trial to do honour to one who richly deserved the distinction. Everyone knows that upon the shoulders of Mr. Robert J. Smith, the secretary of the Scottish Automobile Club, fell the brunt of the work, and that to his courtesy, patience, and consideration has been due much of the success of that event. This fact has been recognised by the competitors, who on Monday presented Mr. Smith with an illuminated address and a gold watch as a small token of the esteem and regard of all who took part in the Trial. Messrs. J. D. Siddels, Eastmead, C. Johnson, T. Shaw, and Colonel Mulliner voiced the feelings of the subscribers, and in concluding the pleasant proceedings Sir John Macdonald, the Lord Justice Clerk of Scotland, added the appreciation of the automobilists over the Border.

Trouble in Shetland.

Now that the motor-car has got into the Shetland Islands legal difficulties are arising to worry the good people of the islands. At a meeting of the Mainland District Committee of Zetland, held recently, a letter was submitted, written on behalf of Mr. Miles Walker, of Johannesburg, regarding the damage which was done to his motor-car at the road at the temporary bridge near Voe. The car had sustained damage to the extent of £25. The letter further stated that the road there was not safe for vehicular traffic, and hence the claim against the County Council. If the money were not paid within a certain period a summons would be served. The members of the committee thereupon considered various alternatives to payment of the amount. The idea of a counter-claim for damage done to the roads was considered, and also proposals to prohibit motor-cars from travelling over those roads, or restricting their speed. But, unfortunately, in the particular case under discussion the car had been on the road, had damaged the bridge, and hurt itself. Eventually, after a prolonged discussion, the matter was remitted to the surveyor to learn the facts of the case.

Accidents in the Streets.

THE energetic secretary of the Highways Protection League has been writing to the papers again with regard to the number of accidents that have occurred in the last few months resulting from motor and horse-drawn traffic respectively. Most people will, however, be prepared to wait for the annual returns of the police on the subject before drawing conclusions. Although a more reasonable attitude is now being adopted by the general Press with regard to accidents in which motor-cars figure, either as aggressors or as the victims, it must not be forgotten that only a small minority of accidents to horse-drawn vehicles ever reach the public ear, and yet those who are on the roads frequently are well aware that these are constantly occurring. The point, however, is not as to the proportion of accidents concerned with either form of traffic, but as to the best means to be taken to minimise the risks of each, and if our friends of the Highways Protection League would confer with some of the motoring organisations on this point some good would probably result.

The Care of Tyres.

VISITORS to the show have been able not only to see cars, but also to pick up some practical hints of real service. In the gallery quite a collection of useful suggestions could be gleaned regarding the care of tyres. There was one expert advising a novice to be generous with French chalk in the outer cover for the benefit of the inner tube. The deleterious effect of rust on the rims, of the acid from the accumulators on the covers, of strong light on rubber, and other risks to tyres were duly enforced, and often the advice was of a positive kind. The necessity of relieving the tyres of the weight of the car when standing idle for many days was also dilated upon, as well as the advisability of taking corners slowly, not only to avoid accidents, but also to save the strain on the tyres. Probably the most repeated advice in the tyre section has been with regard to keeping the tyres well pumped up according to the weight of the car—and here every firm has now its own tabulated views set forth in catalogues and lists which indicate that the makers themselves realise the proneness of motorists to err.

Mr. C. D. Rose, M.P., the Chairman of the Royal Automobile Club and the Motor Union, at the wheel of his 75-h.p. Mercedes car.

A Driverless Car.

THE spectacle of a driverless car has been made familiar to the pleasure-seeking public by means of the biograph. Seen from a comfortable seat it causes amusement; brought into actual reality it would occasion alarm. Proof of this was given the other day in the streets of Forfar, when what might have been a serious motor accident took place. It was, however, fortunately attended by no untoward consequences beyond slight damage to the vehicle. The car, which belonged to an English party, and was occupied by several ladies, was drawn up in front of a shop. During the temporary absence of the chauffeur it appears the vehicle began to move down the street. After proceeding for some distance minus its guide, and causing no little excitement to the occupants, the car was diverted by a grocer's van, and ultimately came to a standstill. The occupants, beyond the alarm, were none the worse for their experience. But what might have been?

Excessive Watering of Roadways.

ATTENTION is again being directed to the alleged excessive watering of the roadway at Kingston by the local authorities, and almost one of the first acts of Mr. W. A. Russell, the new secretary of the Cyclists' Touring Club, has been to appeal to the ratepayers of the borough to insist that their Council shall give heed to recent representations which have been made on the subject. Several accidents are said to have occurred on the Bridge at Kingston, which is approached by roads often in a very greasy state. Excessive watering of roadways, in the centre of which is a wood-paved tramway track, is certainly to be deplored, not only in the interests of those who cycle, but also on behalf of those who motor.

THE Edinburgh Town Council now owns motor-cars which were supplied by Messrs. King and Co. from their showrooms in Bank Street, The Mound, Edinburgh.

GODS IN OLYMPIA.

NOW there lieth between the Blood which is in Kensington and the Via Aperta at the Hammer of Vulcan a spot named Olympia, huge to look upon, rounded as to its roof and with frame wrought cunningly of metal. There dwell the gods in whom lies Power; and the custom is among men to go on journeys even in the dark month which comes next after the Equinox from the ends of the earth to Olympia, that they may behold their gods and offer much gold to those who keep their shrines. Oft-times, after many months, they to whom they offer gold become gods of their own, and they hold parley with their erstwhile friends in manner magnificent. When the pilgrims come at their journey's end—now some there are who drive in chariots like unto the gods themselves; some walk wearily on foot; some have traversed many a mile in the belly of a great worm which crawls in the earth; some are drawn in a strange and cumbrous vehicle which they call "For all"—all cloaked in furs and garments of curious design whereby the rain may not enter to hurt, nor the cold to be a stumbling-block—they pay their

whose breast was a riband of blue, and in whose hand was a statue of gold, "for in that Isle which is in the centre of three lands, throwing out three legs which stretch from Greeba o'er all the provinces, I won a trophy of mark and . . ."

"If 'tis of trophies that we speak," interrupted the lordly Talbot, "I have such a store as hath never been before in the days of the trade, garnered from all quarters where such things may be had for the winning."

Thereupon there arose a loud murmuring from all around and Daimler, who sat in the midst, said he had had many a weekly win, and Weigel said he was speedy to a fault, and Iris had won a medal in Caledon, and Argyll gave trophies away, and there was Vulcan, and Napier, and many another. And they joined in wordy strife, and there was much wrangling, for every god had won something, and none knew which was supreme. So to drown the noise of conflict there was music made by some who sat apart betwixt Heaven and Earth, and there was heard a voice and a cry which echoed with sounds of lament from a place where trumpets, which sound to battle, were bought and sold.

A well-known Landmark on the Brighton Road—the Chequers at Horley.

homage to their gods and their money to their guardians, and so depart.

But it fell on a day that there came no pilgrims, the law of that land forbidding; and those who kept the shrines were glad and sat at home weighing books in the balance, and considering their position. (Some there were who had much to consider.) So the gods conversed together, and this was the manner of it. It was Itala who began, travel-stained yet triumphant, and she lay in a bower of green and said: "These mortals add year by year impiety to impiety! To-day there came one to me saying, 'What a dirty old thing, whatever is it?' forgetting that I had sped from Pekin, which is in the East, to Paris, which is in the West, with a prince in my bosom, and had crossed the swamp and desert of two Continents without failing!"

And Dedion said, "Aye, truth! For thy brother heard similar hard words, who accompanied thee in that journey, though his strength was but the strength of ten horses."

Then quoth Bibendum, "My strength is as the strength of ten, because my rubber's pure."

Fia-Torino next replied, "Though such deeds as these be great, pray remember my prowess! I carried off spolia opima from three fields; I was First In All Trials, and to me was awarded the D.S.O. of the Motor Show."

"I, too, am among the Gods of Speed," cried Rover, across

When the tumult was hushed, there spake a small voice saying, "My masters, I am but a child and a new-comer amongst you, for I was born in Bristol, and my home is in the Avenue which leads to the fountain where laughing girls sell flowers, and timid damsels see all who pass. But I bear the triple green leaves of a distressful island, and my heart is full of hope." And the gods clapped their hands and cried "Welcome, little sister!" Then there arose a god, whom some had likened unto a vacuum-cleaner in jest, for he had no valves in his heart; and Panhard, who required no word of introduction, and there were Pilgrim and Gladiator, and a god of size and weight whose line was saffron and whose name was Mercedes, and they lifted up their clutches together and sang, and rattled their chains in tuneful chorus. And one whose name was Ford, though some called him Perry, strung numbers together in wondrous fashion (for he was a poet), and he recited these verses to them all assembled:

"This yearly show that sees us here again,
How oft hereafter will it wax and wane?
How oft hereafter perchance look for us
Here at Olympia?—And for some in vain."

And a deep silence fell, and three cylinders cracked in their anguish, and a voice cried "Sold!" and a tyre was put on in ten seconds, and great lights glared as at night.

J. B.

The Paris Motor Car Show.

The Exterior of the Grand Palais in which the Salon is held.

WITH even more than the usual *éclat*, the French Tenth Annual Exposition opened its doors on Tuesday last week, with the united hopes of the entire French motor industry centred in the efforts which have been unusually strenuous this year to get the show into shape nearly a month earlier than usual. The organisers are to be congratulated upon the success attending their efforts, for the splendid setting of the Grand Palais has been made resplendent with gorgeous stands more luxuriously appointed than ever, so much so that the visitor, native or foreign, may well be tempted to loosen his purse-strings beyond the limit which would be obtained by a prosaic show-room display. At least, if surroundings have any effect at all, then the background of the finest that French art can produce is calculated to have the greatest and best. Business is generally expected to be about four times the value of the goods exposed, and this year there are forty million francs' worth of cars and accessories insured in the Grand Palais, which means a probable figure of over six million pounds as turnover, resulting from the show.

This year there are 1,100 exhibitors of French nationality, and 300 foreign firms, an increase of 75 in the former and 100 in the latter. The floor space of the stands is 40,000 square metres, against 28,000 in last year's show. It is expected that at least half a million paying entries will be made this year. The tenth annual show is admittedly the most glorious to date.

The French naturally place a great importance on the show, and the President of the Republic was accompanied by the Minister of Commerce and the Minister of War on his rounds on the opening Tuesday morning. Things have changed within the past ten years, for at the first exhibition a public Minister was hardly prevailed upon to visit the exhibition in the small tent in the Tuileries gardens; and it is on record that his final remark on leaving the show was, "But it is very ugly, after all."

The majority of the stands are those of last year, but there are a few new ones. The De Dion is striking in its size and novelty, representing a Chinese gateway, reminiscent of the Pekin-Paris race. The feature of the show, apparent at the first glance around, is the presence of the small car in great variety and number. The heavy touring car has lost ground, and the present vogue is strong for the average of 15-20-h.p.

There are, of course, plenty of smaller cars to be seen, but this size of four-cylinder vehicle would appear to be the popular demand for the coming season, if we except the cry for the cheap *voiturette*, a cry which is oft repeated and never satisfied with the production offered, for the French makers do not appear to hit the mark in this respect. Prices are being quoted more freely than was the case a year ago, but little confidence should be placed in the value of French prices at this present moment, for events in the near future may place a different complexion on the matter. They show but slight diminution over those of the 1907 chassis. One or two are apparently endeavouring to obtain popular favour by a cheap chassis, notably Clement-Bayard with a 14-16-h.p. four-cylinder at 7,500 francs, and Darraqu an 8-10-h.p. two-cylinder at a price which compares well with that of the Sizaire-Naudin *voiturette*, which, with its single cylinder and light armoured wooden framework, is being offered for 3,500 francs. The cheap-and-nasty chassis for full-sized cars is not so apparent as it might otherwise be, for various reasons which it would take a column of space to explain. All firms are preparing to manufacture in large series, and apparently fully recognise the fact that to hold their own in the world's trade their efforts must be somewhat Americanised.

The well-known and established firms do not this year depart much from their standard practice, and what modifications there are appear to be more in the nature of additional details than change in design. In fact, no one appears to expect anything very startlingly new this year—and they will not be disappointed; for, although standardisation is as far on the horizon as ever, yet the well-tried designs and principles are not lightly to be given the go-by unless tangible advantages are to be derived from the modifications to be adopted. The tendencies of the present show are, of course, interesting. The chain cover question is still somewhat in abeyance, but is making headway slowly. The Westinghouse Company fit an oil-bath chain cover. The Charron, Mercedes, and others retain their last year's cover. The matter appears to be more the result of apathy on the part of the purchaser, or the growing use of the cardan shaft may have something to do with it, for the latter is creeping into use on larger powered cars. The Fiat

how a 20-30-h.p. live axle car this year, and there are several six-cylinder cars fitted with cardan in preference to chain drive. For town vehicles of small power the cardan is most universal. The multiple-disc clutch is growing in favour and ousting the leather-faced cone variety, which is used mainly for the small cars. The high-tension magneto ignition is all powerful, especially in the six-cylinder brigade, with accumulators as a reserve, this, of course, implying that the low-tension magneto is dropping slightly out of favour.

The matter of chassis is apparently reaching finality in the adoption of steel and nickel steel with U section, whilst the tubular frame has practically disappeared from the show. The casting of cylinders in groups of two, three, and four, and even six, as well as singly, has not made any headway or tendency to a definite solution, for the same firms offer four cylinders in groups or separately, and no settled opinion appears to hold sway. But further statistics from an annual show would be misleading, and the tendency must be gathered from individual practice as much as from the generality of chassis exhibited.

About thirty firms display over fifty six-cylinder models. These vary from the neat 15-h.p. of the Lorraine-Dietrich and Delaunay-Belleville concerns to the 70 or 80 nominal horsepower of the Italian contingent. High-tension ignition is the rule, but Brasier, Mercedes, and Itala models have low-tension ignition as alternative. Six cylinders in one casting are met with in the new Beatrix model, and a few firms show all six separated. Twos and threes, however, are in the majority. Perhaps the

M. Gustaves Rives, the Baron de Zuylen and the Marquis de Dion receiving M. Fallieres, the French President, at the Paris Salon.
From a Caricature by "Mich" [in the "Auto."]

two most striking sixes on show are the Gobron-Brillié, with its double-piston type of motor well demonstrated by the working model on the stand, with glass cylinder walls, and the Berliet. The last mentioned is remarkable from the fact that it is capable of giving a powerful aid to the motor at times of need—what the French call *un coup de collier*. When running down hill or at times when the full power of the motor is not needed, the motor operates a geared double stage air-pump, of which the casting is inside the bonnet to the left of the motor block. This air is stored in a tank until the time arrives for the great need, when by a simple manoeuvre of a ratchet on the steering wheel the air, under a high pressure, is turned into the cylinders, there to help the horse-power output. The six-cylinder model of 4-inch bore and $4\frac{1}{2}$ -inch stroke, nominally 60-h.p., thus gives 100-h.p. under the influence of the compressed air arrangement. Berliet appears to have carried out the details with great care, and the present model is the result of a three years' study. The idea offers great possibilities to the design of cars along these lines. This is, however, not the only type of vehicle which has an auxiliary power, although the other application is of a very different nature. It is, in fact, the *micle*, or petrol-electric, system offered by Girardot, and is based upon the Pieper patents (Figs. 1 and 2). The aim of the designer has been to present a car which offers no encumbering levers, no troublesome speed-changing devices, no starting handle, no controlling organ—in fact, nothing but a steering wheel and the clutch and brake pedals.

This ideal is obtained by the addition of a dynamo-motor to the petrol group. When the latter is unable to give the desired output the electric motor, supplied at 50 volts 25 amperes from a Tudor 24 cell battery, comes to its aid and proves a most useful adjunct. As soon as the petrol group is again able to take care of the car, the motor acts as a dynamo and recharges the battery, something after the style of the Raworth regenerative control. The motor is mounted at the rear of the engine group and on the same shaft extension. The speed of the car is regulated by controlling that of the dynamo, by a ratchet on the steering wheel. There is an auto-regulator for the admission of gas to the cylinders, according to the speed of the dynamo. One lever on the steering wheel serves for the starting and backward motion, and the second serves to regulate the speed. These and the two pedals above mentioned are all the mechanism to be seen. The model shown is robust and of excellent general design, and is meeting with great success. It is certainly one of the best of the increasing number of electro-petrol or mixed type of cars on show.

It would be too much to expect the Renault firm to make any radical change from their excellent design. Their modifications this year are small and partake of the nature of additions and luxurious embellishments. One of the additions to the town model four-cylinder 10-14-h.p. has been an automatic self-starter, operated from a third pedal of small proportions. The pedal actuates a rod which descends to the shaft, just in the rear of the clutch, and it engages with a pinion on the latter. A few strokes of the pedal with the clutch engaged is sufficient to start the engine. A bronze case protects the mechanism, the whole apparatus being simple and neat. On the larger models Renault fits the compressed air type of self-starter, the compressor being in front of the engine and geared to the shaft. There is also an attachment to permit inflation of tyres from the reservoir. The starting is done by means of a small lever on the dashboard, after turning a small wheel allowing contact to the cylinder of compressed air beneath the chassis. The exhibit comprises a four-cylinder 24-30-h.p. model with a very luxurious body by Rothschild, including a table raised from the floor, camping outfit, electric lighting, lavatory and picnicing outfit, all very ingeniously hidden from sight. Three-quarter springs are fitted to the chassis, following a very general practice at the Show this year.

On the Charron cars the chain case of last year—then an experiment—has been retained for next year's models. A slight innovation in the chassis consists in the rubber blocks which are laid at intervals on the wooden battens covering the frame. These act as buffers for the bodywork. A large three-quarter spring is fitted to the rear wheels, from which the chassis is suspended by the intervention of a vertical rod. Their new 90-h.p. model is conceived on similar lines to the existing types, and is fitted to a neat chassis giving a weight of about 21 cwt. The firm's practice regarding the casting of cylinders in one block, and also singly, is evidently not a fixed one, since there are both varieties on view.

The Rheims Company building the Scar car show one or two novel dispositions. Their automatic oiling system is good for a run of 200 miles, without any attention whatsoever. The form shown on the stand attached to a six-cylinder crank-shaft includes a scoop-shaped intake revolving with the crank (Fig. 5), and ending in a tube connecting to the crank-bearings; the oil is forced into these tubes as the crank revolves, thus insuring perfect lubrication of the bearings. A cam shaft inside the main cam shaft is another disposition of mechanism which is happily found. This inner shaft facilitates starting by independently operating the exhaust valves.

The Burlat car, and more especially the motor, comes very near to what is termed a freak car, especially in these days, when a certain standard practice allows that the motor should be relatively fixed and the crank revolving. In the Burlat motor the cylinders themselves revolve around the crank shaft. The arrangement is by no means so clumsy as it would appear at first thought. There are two cars, one fitted with a four-cylinder motor and another with two groups of four cylinders, making an

eight-cylinder engine. The latter is not extraordinarily long, owing to the arrangement of the cylinders in groups of four around the crankshaft at 90 deg. interval. The arrangement allows one ignition per every fourth thrust by means of a rubbing contact at one point on which the sparking plugs break contact, thereby producing ignition. The speed of the motor can be easily varied from 150 to 1,100 revolutions per minute, at which latter speed the valves are held open by centrifugal force, thus avoiding racing. The axis of the crank-shaft is eccentrically placed relative to the central rotating point of the four-cylinder motors, the cylinders being thus offset. The whole arrangement is most curious, and as a rotating motor it is one of the most successful ever presented. The carburettor is automatic, and the mixing chamber is in the crank case, the crank movement assuring a perfect mixture. The gas is taken from the base chamber, and thus all feed tubing is abolished. Finally the piston rods are rigidly fixed to the cranks. Criticism is very freely aimed at the motor, but it is impossible to de y

not only has places for the ladies in the inside of the phaeton, with its many panelled windows and bright yellow trappings, but in addition to the driver and a seat beside him the car will accommodate two other persons over the top of the car, the footboard forming a protection to the driver's head. There is a hood over the two outside seats, and the whole arrangement gives a really smart appearance. As regards changes in general design, the Darracq Company are fitting the special combination gear-box and live axle, which is being shown at Olympia, so that its features do not need repetition in this week's number.

Among the firms having given renewed attention to the braking system may be mentioned the Westinghouse Company, which firm is also fitting stout sheet-iron covers, with oil bath, to the driving chains (Fig. 3), a most successful application. The Brouhot brake mechanism also deserves attention from the fact that the rods are equalised, giving a direct pull on the two rear drums from a rod exactly in the line of the axis of the car.

The La Buire Company show a new spring-mounted live

The Paris Salen.—A View of the Interior of the Grand Palais at night.

that there is much simplicity and good general design bestowed on the details of this novel creation.

The Panhard models are largely replicas of those of last year. Braking by means of air admission to the engine is introduced, although many leading firms discouraged the idea for some long while. This year's novelty consists in the automatic supply of oil according, not to the speed of the motor, but to the output. Not a drop too much oil is fed to the motor, no matter what speed the group is running at. The firm have acquired a licence for the Saurer automatic starter, which is of the compressed air type, and fits the device to specification. This also allows a tap for connection of the air reservoir to the tyres, and a pressure gauge is provided for the latter. The firm stands to its guns in respect to the retention of armoured wood chassis.

The Darracq Company, which is making a great bid for popularity in respect to its 1908 prices, has not a great deal to show in the way of novelties. On the stand there is a car which reminds one very much of the old-fashioned stage coach, for it

axle without joints, a new oil bath disc clutch, and a new carburettor with multiple spray jets, permitting an economical and efficient running under all conditions of operation. A patent device is provided for greasing the shackles of all the springs, and finally a specially supple rear suspension, the lower half of the elliptic rear spring being lengthened and raised in front as much as possible with inlaying shackle to the top half of the elliptic spring, which extends downwards, too, at its rear extremity as much as the lower half extends upwards in front. The usual excellent workmanship is, of course, quite irreproachable.

The Gobron-Brillié is perhaps one of the most expensive cars in the show. The 70-h.p. six-cylinder twelve-piston model is attracting a deal of attention, and the motor also drives an air compressor which operates a self-starter. The reservoir is below the chassis on the off side, and has tap connections for use in inflating tyres. The car has two clutches worked by one pedal, the first, being metal-to-metal, coming first into operation; the second being leather faced, and comes into action when the pedal is further depressed. The use of alternate exhaust pipes

allows one to cool whilst the other is in use. A working model of the type of double-piston motor is to be seen, and the glass cylinders allow the whole mechanism to be well examined. The motor is, of course, adapted to the use of denatured alcohol fuel, the firm supplying the engine for the Paris alcohol-burning motor-buses.

Besides the engrossing interest offered by the presence of Nazzaro's racer, there is to be seen on the Fiat stand a 20-30-h.p. cardan shaft model, a new departure in large cars for this firm. The back axle casing is strengthened by being bolted vertically along the centre line. The rear wheels are set slightly out of the vertical plane, together with their live axle shafts, this being intended to avoid the inplaying of the wheels in case of overloading. A force pump is now fitted for lubricating, this being geared to the crank and situated inside the base chamber. A 35-45-h.p. and a 60-70 h.p. six-cylinder model are also presented as the acme of the Italian firm's production.

The De Dietrich Company has lately purchased an immense works at Argenteuil, close to Paris. On their latest vehicles the clutch runs in oil, and is remarkably smooth in action. The shock absorbers arranged to take the side strains are worth attention. A new system of lubrication consists in the pumping of oil from the base chamber. All the models are chain-driven except the town carriage. The 15-20-h.p. six-cylinder is a very neat model, with cylinders 80 by 120 mm. It is actually the

Figs. 1 and 2.—Elevation and Plan of G.E.W. Combination Petrol-Electric Car. (See page 824.)

smallest six-cylinder in the show. The Delaunay-Belleville six cylinder has cylinders 85 by 120 mm., and has a slightly higher maximum capacity. The feature of the chassis is the low-lying construction, allowing the fitting of very roomy doors.

Another of the Italian invaders is the Bianchi, which also deserves special mention. This year a new 70-h.p. type is exhibited, including, amongst other features, a double bottom to the petrol tank acting as a drain for the impurities in the oil. Steel rods are used in place of flexible cables for the brake operation. Another model is the 15-20-h.p. four-cylinder type with raised rear frame. The consumption of fuel on this car is stated not to exceed $2\frac{1}{2}$ gallons per sixty-two miles. A 40-h.p. model is also displayed.

The Hispano Suiza, the only Spanish built car, and made at Barcelona, is well worthy of notice. The workmanship and material are quite up to the best modern practice, and the simultaneous control of the double ignition is a good point, as is also the patent steering device. [The new models are dealt with in our Olympia show report.—Ed. M.C.J.]

The Itala firm show some very fine models this year, but none have any changes of importance from their standard practice. Their 60-h.p. and 75-h.p. six-cylinder cars are very attractive and of excellent design. It is difficult to make any criticism of the cars turned out by this firm.

The particular interest of the Peugeot Company's stand

centres in the chassis of the new six-cylinder car, Figs. 6 and 7. The engine has the cylinders cast in pairs, with the valves on opposite sides, the bore and stroke being respectively 130 mm. by 140 mm. The clutch is of the multiple-disc type, and the four-speed gear-box gives a direct drive on top to the differential shaft, the transmission then being by side chains to the rear road

Fig. 3.—The Chain Case on the Westinghouse Cars. (See page 825.)

wheels. Throughout the vehicle has a robust construction, and should fully maintain the Peugeot reputation for reliability. The Peugeot series of models for the 1908 season comprises 9-h.p. single-cylinder; 10-h.p. two-cylinder; 18-h.p., 28-h.p., and 50-h.p. four-cylinder; and the 60-h.p. six-cylinder above described.

An interesting car built at Lyons, which so far has not been seen in England, is the Cottin-Desgouttes. This is on the usual lines of chain-driven vehicles, the series ranging from 12-14-h.p. four-cylinder to 30-50-h.p. six-cylinder. The 12-14-h.p. is a new model intended for town carriages. From Fig. 8, which gives a general view of the Cottin-Desgouttes motors, it will be seen that the magneto is conveniently arranged. The carburettor is of special design; it is exceedingly economical in fuel, as was proved in the recent Coup de la Presse Contest. The auxiliary air-supply can be regulated from the dashboard, while the whole carburettor can be dismantled by removing one nut. The clutch is of the multiple-disc type, of special design, and

Fig. 4.—The Renault Back Axle. (See page 824.)

in other directions the details are of the most up-to-date character.

Les Etablissements Dubanot, who are now represented in Great Britain by the Car Supply Company, Ltd., of 34, Knightsbridge, London, W., are making four four-cylinder models for the 1908 season. The 12-h.p. has the cylinders cast *en bloc*, while

in the others they are in pairs. A feature of the design is that the engine and gear-box are built up in the form of a unit (Fig. 9), so that any tendency to distortion is eliminated. The ignition in all cases is by Simms-Bosch high-tension magneto, while lubrication is effected by a pump operated off one of the cam shafts. In the smaller model the water circulation is on the

Fig. 5.—Crank Oiling System on the Scar Car. (See page 824.)

thermo-syphon system, while in the others it is maintained by a gear-driven pump and honeycomb radiator. The 12-h.p. and 15-h.p. have fibre cone clutches in place of the usual leather facing, while the 22-h.p. and the 35-h.p. models have multiple-disc clutches. The transmission is through a ball-bearing gear-box and cardan shaft, with joints at both ends, to the live axle. The differential case of the latter is provided with a detachable cover so that the gears can be readily inspected. In view of their moderate price the Duhanot cars should quickly become popular amongst British motorists now that they are being introduced into England.

Among the voiturette fraternity there is much strenuous effort to get a presentable car, and at a moderate price. Inventors are tumbling over each other in the effort to obtain popular favour, but there is a vast chasm between the best cheap voiturette on the French market and the small car presented at bottom price by the leading makers, including the Darracq and the Sizaire-Naudin. The latter, although called a voiturette, deserves a place among the small car section, and, in fact, by its performances, has obtained a special distinction this year by a prominent stand in the Grand Palais.

There is a deal to be seen in the way of friction-driven vehicles, and there may be half-a-dozen firms of more or less

Figs. 6 and 7.—Plan and Elevation of the Peugeot 60-h.p. Six-Cylinder Car. (See page 826.)

repute which offer examples to the public gaze. The public admire the price but not the value offered therefor, and pass on with a sigh. The Turricum is one of the best variety of friction drive, and the Parvula goes a step further by giving a double plate drive, the rear plate also rubbing against the driving shaft by means of a flexible transmission by an endless cord surmount-

ing two superposed pulleys. It has been repeated oft and oft during the present show that the man who presents a sound voiturette at a moderate price will make a fortune, just as the one or two makers of excellent small cars are doing. The case of the three wheelers is somewhat different. The tri-cycle construction was in a more advanced state from which to make a start. The tri-cycle has long received attention at even the best makers, De Dion and Leon Bollée having turned out some creditable examples in the early days of motorism. The tri-cars offer, of course, the driver's seat and one or two others, thus immediately giving an advantage over the voiturette on four wheels. Besides, the tri-cycle could not ape the small car, try as it will, and this is the mistake that the voiturettes are still blindly falling into. Thus the few firms making tri-cars are selling perhaps a limited yet certainly a remunerative output.

The present vogue of aeroplane and dirigible experiments is causing quite a number of firms to produce light motors. The movement will do a deal of good in producing light motors for use on small cars. Air-cooled systems are largely patronised. Among the older firms the Buchet motor is one of the best. The Esnault light motor designed especially for aeroplane and airship work, is attracting much notice. For a new engine the Esnault is of excellent workmanship, and its features give it an originality

Fig. 8.—The Cottin-Desgouttes 24-40-h.p. Motor. (See page 826.)

without obtaining for it the reputation attaching to certain other new productions. The groups shown in the Salon include a seven-cylinder model sectioned to show the operation. The cylinders are arranged in groups of four and three, the latter behind the former. All the cylinders occupy a sector of about 70 deg. distributed fanwise. The cams for each group are on the rim of a circular plate, mounted directly on the motor shaft. There are two lifts per cam, one lift giving the exhaust and the second closing the exhaust and opening the inlet valve. The appearance and operation of the motor appears to be very satisfactory, and the experiments made with it on the Esnault aeroplane confirm the confidence of the inventor. The motor is air-cooled, and weighs about 100 lbs. for 35-h.p. nominal output.

The familiar V-shaped arrangement of the cylinders of the Antoinette motor meet the eye under a tasteful stand, on which are shown a model aeroplane, with motor in position. The engine is run without carburettor, but has a force pump for the fuel feed; a carburettor, however, can be fitted. Generally, the feed is made by means of compressed air stored in a cylinder, and an air-compressor is fitted in consequence. The famed motor of extra light construction is, of course, well known as regards its general lines. The firm is obtaining much success this present year both in hydroplane, aeroplane, dirigible, and motor-car departments. The 100-120-h.p. sixteen-cylinder motor, with 105 mm. bore and stroke, 1,400 revs. per min., weighs but 290 lbs. complete, and consumes not more than three-quarters of a pint per horse-power hour.

Among the accessories, the Autoloc device for all kinds of transmissions, whereby the desired position is automatically obtained without effort and without any trouble in unlocking,

has made progress. The makers of shock absorbers appear much in the same position as in 1906. The specialists in radiators, springs, &c., are still specialising, but appear to wait upon the constructors for the next move. There are one or two firms who are prepared to sell complete chassis, minus the motor. The idea may be good for those experimenting with engines, but the palmy days of the business are past. The builder of the motor makes up his own chassis, or there is nothing in the business. Tyre makers are as busy as ever, and it would appear that the coming season is going to see some rate cutting in this line—in fact, the movement has already commenced. Spring wheels are to be seen galore, but their comparison would need a volume. Tyre-fitting materials are increasing in number, but removable rim devices do not appear to be so prominent as prophesied. It has been found that the idea was somewhat puffed, and tyre troubles are now not so frequent that their repair necessitates the carrying of a spare rim, of which the bolts are apt to loosen and cause trouble in their own particular way.

In the carriage-building section there are one or two ingenious body-lifting devices on view. There is a patented device by which the front seat of a short chassis can be pivoted forward, not sideways, to allow a side entrance. Another arrangement is a rolling top hood or *capot*, stowing away at the rear of the car in an almost invisible manner after the fashion

Fig. 9.—The Daimler 12-h.p. Engine, Clutch and Gear-Box complete as a unit. (See page 826.)

of roller blinds. When this is unrolled it is secured to two perpendicular posts, one on each side of the dashboard, which latter telescope out of sight when the hood is rolled back. It is a neat contrivance, and, of course, fully patented in all civilised countries. The general luxury seen a year ago in the best bodies is even more accentuated. The bodies of some cars are suspended, with independent springs, quite apart from the driver's seat and that alongside him. Another neat arrangement is a doctor's visiting phaeton, in which the seat next the driver is included in the enclosed portion, and is fitted with a marble top table on which the doctor may lay his instruments or sort various accessories during the run between patients' houses. A small bookcase is formed below the table, and a first aid outfit carried. There are, in fact, more bodies of all descriptions than ever before, and the general quality is good, with less of the American cloth variety to be observed.

Among the successes of the present *Salon* must not be overlooked the retrospective show, which occupies a very considerable space in the temporary building erected on the Esplanade des Invalides. It extends for some fifty yards on each side of the main entrance, and is two or three cars deep on either side, comprising fifty or sixty cars in all. The first and earliest-made car is a very creditable attempt by a French military genius towards making a road steam-engine, in the year 1760. The steering wheel, driver's seat, form of chassis (of 10 in. oak

beams), and wheels with iron studs in the tyres, would remind one very much of even the recent street cars for shifting material; but there the comparison ends. In front of the single driving wheel, ahead of the car, is a huge caldron for generating steam. The two pistons act directly on the wheel, and the clumsiness of the transmission rods is more than apparent from comparison with the next attempt, dating, however, a hundred years or so later. The early attempts of Serpollet, of Leon Bollee, and of De Dion are all on show, including also the Mors and the Jenatzy cars—a most interesting series of "old junk" that could well be found on the Continent. Even the Daimler first models are on view. A glance through the models would make one imagine that a page of ancient history were open before him, but a look at the neat card description of each model, with the dates—1895, 1896, 1898 and 1900—together with the racers of later date, bring one forcibly back to the contemplation of the immense and almost lightning-like progress which has been made during the present century. This feeling is more than accentuated if the visitor has just made a round of the chassis in the Grand Palais. And yet in the years 1897–8 there was a certain Forest, of Brest, experimenting with a six-cylinder explosion motor, cooled by water, vertically arranged by pairs, three cranks on one shaft, magneto ignition and operated valves. There are also steam road 'buses made in the year 1878 and thereabouts as well as the early tri-cycles, steam, and others of the nineties. The first Renault, the first Panhard, the first Mors, there they all are, telling with forceful silence the tale of struggle and success which is the main reason for their reappearance during the present year. As the French candidly say, were it not for the famous English Road Act, the French would not be in their present powerful position *vis a-vis* the motor industry. If the Paris Show is worth a visit, it is worth it for one feature alone—the retrospective exhibition in the Invalides, a fitting place for the old warriors, too.

A GARAGE and repair shop has been opened at Carlyle Place, Abbeyhill, Edinburgh, by Messrs. Brierley Bros.

THE borough of Salford, following the example of London, Sheffield, Glasgow, and Swansea, is to have a motor ambulance.

MESSRS. CHAMBERS MOTORS, LTD., of Belfast, have had a very successful season following the performance of their cars in the Scottish Trial.

LONDONERS near St. Paul's Cathedral on Wednesday afternoon saw a motor-bus on fire. The flames were ultimately extinguished by a motor fire engine from the Watling Street station.

FOLLOWING imitations of the mediæval writing, Mr. Reginald Rigby has written and illustrated some quaintly humorous poems, which are published by Messrs. Sealey, Clark and Co. under the title of "Motorynge in ye Myddle Ages." The work is decidedly interesting, and will help to beguile a weary hour.

MRS. R. A. JONES is contributing to the Journal of the Southend and District Motor Club an account of their first motor tour. At Shrewsbury they found the Clarendon a comfortable hotel, with a more reasonable tariff than they had discovered at Oxford, Monmouth, and Worcester. At Lichfield they were equally well pleased with the George Hotel.

MESSRS. WELTE AND OWENS, LTD., whose business was established about three years ago under the style of the "Enterprise" Motor and Accessory Company, have built up quite a large trade in motor accessories, and at their large depot at Colquhitt Street, Liverpool, hold a large stock of all the principal fitments at present on the market. The company are also the district agents for the Hotchkiss and Vulcan cars.

MESSRS. MONNET, PLASSE AND CO., 20, Store Street, Tottenham Court Road, W., issue a useful list of "a few important motor accessories," including the Nieuport plug for small cars, the Rapid American tyre inflator, actuated from the flywheel and pumping up a 120 mm. tyre in a couple of minutes, the Python horn, the "Monnauto patent road clearer," otherwise a horn with a deep musical note, the Carpentier plug, &c.

MR. A. MORRIS THOMSON, having resigned his appointment at Alexandria, N.B., has joined the Darracq Company as consulting engineer.

A COUNT on behalf of the Dunlop Pneumatic Tyre Co., Ltd., on Tuesday, the 12th inst., showed that on the cars exhibited at Olympia there were 2,181 tyres, of which 1,205 were Dunlops.

THE King of Spain spent a long time at the Miraculum stand at the Olympia Motor Show on Monday, and had two demonstrations of the efficiency of Miraculum given to him, being much interested in the matter.

THE enterprise of the committee of the Motor Club in securing premises at 6, West Kensington Gardens, for a branch club during the Motor Show, has been amply rewarded. About a hundred members have sat down daily to lunch, and about half that number to dinner.

THE Darracq dinner at the Café Royal, London, on Friday, the 15th, was an enjoyable function, in the course of which Captain Rawlinson referred to the foresight displayed in designing cars well ahead of the selling season. Speeches were also made by Messrs. Dunn, J. Keele, Huntley Walker, G. Heath, T. Garner, and H. B. Cook.

THE Union Motor Car Company, of Denbigh Street, Belgrave, S.W., supplied the 20-30-h.p. Renault landaulet which was selected by the King of Spain for his use during his visit to the Duke of Orleans at Wood Norton on the occasion of the Royal wedding. The car was driven by Mr. Wolstencroft, one of the partners in the above firm.

IN the R.A.C. dust trials the order of merit of the first three in the class for makers' standard cars at 20 m.p.h. were:—One 24-32-h.p. Porthos, two 30-h.p. White, and three 12-16-h.p. Wilson-Pilcher. For amateurs' cars the first three places were taken by Mr. D. Mooney (20-h.p. Stanley), Mr. A. F. Slee (10-h.p. Renault), and Mr. F. Hughes (20-h.p. Dennis).

THE Shrewsbury and Challiner Tyre Company, Ltd., have issued a new catalogue of their patent detachable rim, in which the under sides of the ordinary pneumatic rim are engaged firmly by the upper bevelled edges of the device, securing easy attachment and firm security when fixed. The process of manipulation is simple, and copies of the pamphlet can be obtained from the company's offices at Kay Street, Ardwick, Manchester.

THE older specialties of the E. M. Bowden's Patents Syndicate will be mostly shown at the Stanley Show, as at Olympia, in a new and improved form, including specimens of such well-known fitments as the Bowden patent mileage recorder, a dashboard positioned recorder which dispenses with the usual flexible shaft transmission; the Bowden gas throttle, which regulates the supply of gas to a nicety; and the Bowden controls for cars to suit all patterns and all tastes.

THE New Speedwell Motor Company, Ltd., have sent us a couple of photographs of the new works they have erected on the Staines Road, Hounslow, and into which they will be moving during the course of the next few weeks. Arrangements are being made to continue the manufacture of Speedwell cars at Chiswick right up to the eve of the removal, so as not to interfere with deliveries. The new buildings occupy just over half an acre of land, and provision is being made for extensions to be carried out to the extent of about another acre.

THE official certificate of the Royal A.C. with reference to the petrol consumption trial of the 12-16-h.p. four-cylinder Argyll cab describes the test as consisting of 2½ hours running in London traffic, a distance of 20½ miles being covered, and the amount of fuel used being 7 pints, or 23·4 miles per gallon. A run in the country was then taken, 2 gallons 1 pint 8 oz. of petrol being used, equivalent to 24 miles per gallon. Pratt's Borneo spirit was used in both runs, and the specific gravity, taken immediately before the start, was ·765 at 58 deg. Fah. The roads were heavy for the greater part of the country journey. The engine accelerates quickly, even on top gear from a slow speed, and the car was easy to handle in traffic.

HERE AND THERE.

UPON a 12-14-h.p. Argyll chassis the Metropolitan Asylums Board are building their own ambulance body for the conveyance of patients.

THE latest catalogue issued by Messrs. Van Raden and Co., Ltd., of Foleshill Road, Coventry, gives an excellent description of the manufacture of spun glass accumulators upon which the firm have specialised.

MESSRS. DENNIS BROS., of Guildford, have sent us an illustration of the new design they have got out of a three ton petrol motor tip-wagon. It is designed for speeds up to ten miles per hour.

DURING their stay in this country the German Emperor and Empress are using Daimler cars. On Saturday last no less than nine vehicles met the Kaiser at Paddington Station, and he afterwards made a tour of London with his suite.

MR. PAUL BRODTMANN, managing director of the Continental Tyre and Rubber Company (Great Britain), Ltd., had the honour of being presented to the German Emperor at the reception held at the German Embassy on the occasion of the Emperor's visit to London. Mr. Richter and Mr. Ulrich, of the same firm, were honoured in the same way.

The Daimler-Mercedes 35-h.p. Four-Cylinder Engine.
(See page 800 last issue.)

"MOTOR UPKEEP" is the title of a new pamphlet issued by Messrs. Philip Beresford, Ltd., of Cecil House, Charing Cross Road, W.C., which will be of value to many prospective motorists in assisting them to a selection of their car. The firm undertake to maintain vehicles at an inclusive cost, and generally to make pleasant and economical the path of the motorist.

ARGYLLS HAMPSHIRE, LTD., Southsea, have recently supplied a 14-16-h.p. Argyll to Admiral Sir Percy Scott, who is in command of the Mediterranean Fleet. The car has been taken away by him on his flagship "Good Hope," and will be put ashore at every convenient place as a means of carrying out his various official visits, and also as a means of exploring the districts. Another naval motorist who has lately acquired a 14-16-h.p. Argyll is Admiral Robinson, of H.M. Dockyard, Portsmouth.

AN improvement has been brought out by Messrs. E. W. Willard and Company, of Paradise Street, Birmingham, in connection with their "Elouard" screen, recently described in the M.C.J. We have seen one of these mounted with a polished brass frame, the bottom portion of which was shaped to suit the dashboard of a 10-12-h.p. Darracq car, thus doing away with the usual method of filling up the space between the top of the dash and the bottom of the screen with wood. The screen looked extremely smart, and the makers tell us the extra cost is but trifling.

THE Star Hotel, High Street, Southampton, now possesses its own garage with inspection pit.

THE Military Tournament and Motor Gymkhana held at Lytham in August last resulted in a profit of £80.

REPAIR works for motor-cars have been established at Torquay by the Torquay Garage and Motor Works.

THERE are no less than 1,403 exhibitors at the Paris Salon this year, as against 1,235 at that held in December, 1906.

A LIST of the foreign duties on motor-cars is published by the West End Motor-Car Packing Company, 132, Grosvenor Road, Westminster, S.W.

A "MOTOR-CAR LIVERY BUSINESS" is now being conducted in San Francisco by ten chauffeurs of that city, who have entered into a little combination on their own account.

A BILL dealing with the lighting of vehicles in Scotland on the lines of the measure which is shortly to become law in England, Wales and Ireland is to be drafted by the Scottish A.C.

THE Rajah of Mudhol has ordered a 35-h.p. seven-seated Daimler car from the Bombay Motor Car Company, Ltd., while the Maharajah of Mysore has just taken delivery of a new 14-16-h.p. Fiat landaulet.

Front View of the Daimler-Mercedes 60-h.p. Six-Cylinder Car.
(See page 800 last issue.)

THE second motor sale held by Messrs. Hampton and Sons at Brooklands on Wednesday contained over thirty entries. As on the previous occasion, prospective purchasers were able to try the cars free of cost round the track on the morning of the sale.

WE hear that the Redbridge Motor Works, of Redbridge, near Southampton, are at present building a 60-h.p. eight-cylinder engine for a racing car. There are a number of interesting features in the engine, notably in the provision of an auxiliary exhaust. The crank-shaft will have a bearing between each cylinder, ball bearings being fitted at the two ends.

A FEW days ago a fire broke out at the Irish town of New Ross, which was likely to extend almost throughout the place until it was arrested by the arrival of several firemen from Waterford with lengths of hose and all the connections for the hydrants. These were summoned by telephone in the night and driven from Waterford to New Ross by Mr. W. F. Peare, the well-known motor agent of Waterford, who will be remembered by many of our northern readers as having taken part in this year's Scottish Reliability Trials. Thanks to the celerity with which he was able to take assistance, further disaster in the town was averted.

THE Paisley Town Council is considering the adoption of a motor fire-engine for the borough.

THE Dunlop Pneumatic Tyre Company have undertaken a selling agency for Elastex in the United Kingdom.

IN the High Street, Grays, Mr. G. E. Carter has a motor garage open day and night for the convenience of motorists journeying in that corner of Essex.

THE Shanklin (Isle of Wight) District Council has decided to erect three notice-boards at the entrances to the town warning drivers of motor-cars to reduce speed in the streets.

THE Renard road train is completing a tour of Ireland, and during the last few days has been located at the garage of Messrs. John Robson, Ltd., Chichester Street, Belfast.

MESSRS. TAVENDALE & Co. have a splendid garage at Lawrencekirk, N.B., and another at Murrayfield, Edinburgh. They have been busy on repair work throughout the season.

AMONG the minor exhibits at Olympia is a new card game known as the "Motor," which is to be seen on the stand of Messrs. Gamage, and will doubtless be played by motorists to beguile some winter hours.

THE improved 1908 pattern of the Continental non-skids has much shorter studs than heretofore, and with the increased canvas backing gives the tyre even more mileage than in the past, while in no way reducing its effectiveness as a non-skid.

FROM the Daimler Company comes a handsomely got-up book describing a motor-car picnic in Spain, and a tour of a Daimler car in the same country. The work is fully illustrated by photographs, and is of an exceedingly interesting character.

A GAMAGE motor clock fitted to the dashboard of a 30-h.p. Whitlock-Aster car, and belonging to Mr. Sydney Francis, A.M.I.M.E., was recently being driven through Forest Gate when the car took fire and was completely destroyed, notwithstanding the efforts of the fire brigade. The remarkable circumstance about the incident, however, was the fact that the clock on the dashboard, after its extraordinary baptism of fire and water, was found to be still going. The glass of the clock was cracked all over, the soldering of the case gave way, the rim of the case parted with its flange and has lost its glass, the packing in the interior of the case was quite soddened—but the clock is still keeping good time.

AN excellent catalogue of their specialities has been issued by the Validus Non-Skid Motor Tyre Company, at whose headquarters at 109, Victoria Street, Westminster, S.W., can be seen a full selection of their unpuncturable leather non-skids; leather and rubber non-skids vulcanised to the tyre by cold process, and detachable non-skids which are easily fitted and detached either to new or worn tyres. The company have in stock a large selection of newly retreaded tyres, and also call attention to their Validus rubber retread, into which canvas insertions are made, rendering it specially suitable for heavy cars. This form of retread partly acts as a non-skid without causing any resistance to the steering of the vehicle. Reference is also made in the list to the Validus horn and attachment by means of which the rubber bulb is dispensed with. The construction of the horn is so simple there is nothing to get out of order, and it has a smart appearance when fitted to the car.

AN ingenious six-stroke petrol engine, devised by Mr. A. Rollason, of Long Eaton, Derbyshire, is described in the last issue of the "Birmingham University Engineering Journal." The arrangement is not only ingenious but gives an exceedingly high efficiency, tests made with the engine showing that at full load, at speeds varying from 300 to 1,000 revolutions per minute, the consumption of petrol was 0.54 lb. per i.h.p. hour, and 0.66 lb. per brake h.p. hour. The thermal efficiency of the engine per i.h.p. was 25.0 per cent., while the heat rejected to the water jacket was only 30.7 per cent., and exhaust 44.3 per cent. The analysis of the exhaust gases gave carbon dioxide 6.3 per cent., oxygen 8.7 per cent., and the exhaust contained no carbon-monoxide or hydrogen, and was clear and odourless. The compression of the engine was 75 lb. per square inch, and the mean pressure shown on the indicator cards was 90 lb. per square inch. The mechanical efficiency of the engine was 82.5 per cent., which must be considered a very good performance.

CONTINENTAL NOTES.

A German Motor Racing Track.

A scheme to establish a motor racing track in the neighbourhood of Berlin is at present under consideration. The course, which would be about 10 kilometres long, is situated near Teltow.

A Live Axle Mercedes Car.

We learn from a reliable source that the German Daimler Company, which has hitherto confined its productions to chain-driven vehicles, intends shortly to place a live axle car on the market.

The Motor-Car in War.

The French Minister of Commerce presided at a banquet given on Thursday last week to celebrate the opening of the

motors. Four of the designs submitted were rejected on the grounds that they did not meet the regulations laid down. The first prize has been awarded to the apparatus entered by Messrs. Chauvin and Arnoux, while honourable mention is given to that of Messrs. Wills and Cheron.

Public Services in Spain.

A public motor-bus service has been started between Caceres and Trugillo. The vehicles used are of the Suddutsche (Gaggenau) single-deck type, the body being divided into two compartments for first and second class passengers. The motive power is supplied by a 36-45-h.p. four-cylinder engine.

Miscellaneous Items.

A State service of motor-omnibuses is to be established next year between Passau and Zwiesel, Bavaria. The route is via Tittling and Schoneburg, and passes through a picturesque por-

Prince Alexander Solms, the President of the Austrian Automobile Club, on his 40-h.p. Graf-Stift Car at Gratz.

[Allgemeine Automobil Zeitung.]

tenth annual motor-car exhibition in Paris. Covers were laid for no less than 1,200 guests. General Picquart, the Minister of War, laid stress on the usefulness of motor-cars for military purposes, and on the great rapidity with which the troops had received supplies by this means during the recent manoeuvres.

Industrial Vehicle Trials in Italy.

The Italian Automobile Club, in conjunction with the Touring Club of Italy, is making preparations for the holding of a reliability trial of industrial motor vehicles and omnibuses to be held in the neighbourhood of Plaisance, Italy, in September next year.

Petrol Consumption of Motor-cars.

Six competitors entered for the competition organised by the Association Generale Automobile, of Paris, for the best apparatus for measuring the consumption of spirit in petrol

tion of the Bavarian Forest.—An epidemic of motor lamp stealing is just now prevalent in Paris.—The Great Berlin Motor-Omnibus Company is on the point of making an experiment with a combination petrol-electric motor-omnibus, which has been built in conjunction with the Siemens-Schuckert Works Company.—It is reported that Thery, the old racing champion, will again be seen at the wheel of a Brasier in the leading motor races next year.—An Automobile Club has just been formed at Salzburg, Austria.—A motor-bus service is being started in Paris between the St. Lazare and Lyons railway stations.—The German Ministry of the Interior has ordered an enquiry to be made into the present state of the automobile industry in that country.—A company has just been formed in Milan under the title Tattersall Automobilista Italiano, to establish a large depot for the sale of second-hand cars in Milan, as also a garage and a motor school.

The Olympia Show.

(Continued from page 812.)

The B.S.A. Cars.

The name B.S.A. is so well known in the small arms and cycle world that the advent of the BIRMINGHAM SMALL ARMS COMPANY, LTD., in the motor industry is a matter of more than ordinary interest. Two models are being made, both having live axles and four-cylinder engines, the 18-23-h.p. having cylinders 98 mm. by 120 mm., and the 25-33-h.p. 115 mm. by 130 mm. The cylinders of the latter are cast in pairs, and the valves are located on opposite sides; in the 18-23-h.p. they are all on the left side. In both the automatic carburettor is set close in to the middle pair of cylinders, so that there are no inlet pipes in the ordinary sense of the term. The exhaust cam shaft has half-compression cams to facilitate starting. The crank shaft has a bearing between every throw, the latter being supported on the top half of the crank case, enabling the bottom portion to be removed without disturbing the bearings. On the 25-33-h.p. car the water circulation is maintained by a pump, while on the smaller car it is on the thermosiphon or gravity system. The radiator is attached to the frame through a pivoted joint, to prevent any strain being thrown on it. The smaller engine has high-tension magneto ignition; the larger one has both Simms-Bosch low-tension magneto and accumulator and coil ignition systems. The make-and-break cams are mounted on the

has been devoted to the design of the various details and to the selection of materials, in order that the cars shall fully uphold the B.S.A. reputation.

The Pilain Cars.

Three examples of the Pilain vehicles are shown by Mr. A. PELLANT on this stand—viz., 24-h.p., 40-h.p., and 60-h.p., all provided with motors having four cylinders. The 24-h.p. is fitted with a very handsome limousine body, the 40-h.p. is shown as a chassis, whilst the 60-h.p. is displayed with a touring body in the grey, and unfinished. In the motors of the 24-h.p. and 40-h.p. types the cylinders are cast in pairs, whilst the 60-h.p. has separately-cast cylinders. Low-tension magneto ignition of the Simms-Bosch type is fitted to all models, but some modifications have been introduced in the method of operating the tappets and trip gear. The clutch has been remodelled, and is now of the metal disc type, without intermediary springs. Transmission from the clutch to the gear-box is by means of a cardan shaft. Four speeds are provided, both the third and fourth being direct drives. This is obtained by dog clutches engaging with the respective bevel pinions. The third-speed bevel-pinion shaft is, in fact, a sleeve fitting loosely on the main shaft carrying the fourth-speed bevel, and of course engages with its particular crown wheel carried on the differential

Fig. 57.—Chassis of the B.S.A. 25-33-h.p. Car.

upper end of vertical spindles, driven by skew gearing off the cam shaft. The flywheel, which has its arms formed to act as a fan, is a crucible steel casting. The clutch is of the metal disc type, the discs, which are of steel, being provided with narrow radial slots to facilitate the escape of oil when the clutch is engaged. An Oldham type of joint is employed between the clutch and gear-box to allow for any want of alignment between the two parts, and also enabling either to be readily dismounted. The gear-box on the larger car is adapted to give four forward speeds, and on the smaller model three, in addition to the reverse. On the top speed the drive is in both cases direct, the control being by a lever working in a "gate." The selecting rods are enclosed within the gear-box; the latter is in one piece, and is provided with a large inspection lid. The shafts are of nickel steel, short and heavy, the sliding shaft being castellated. The cardan shaft is provided with universal joints at each end, while the bevel gear is well supported. The road wheels run on heavy ball bearings carried on a solid forged steel tubular axle sleeve, with heavy flanges securely bolted to the differential case, the power being transmitted to the hubs by the castellated ends of the live axle. The differential gear is of the ordinary bevel type, having pinions gearing into two bevel wheels of large diameter. The back axle is so arranged that by removing the cover to the differential case the bevel gear can be readily removed. The pedal brake works on a drum on the end of the gear-box, and is water-cooled. The hand brake operates direct on the back wheel hubs, and is of the internal expanding type. The brakes are of strong construction, with facilities for easy adjustment in case of wear, and the shoes are all lined with cast iron. The frame is narrowed at the front to increase the steering lock, and raised at the rear to clear the axle. From the foregoing particulars it will be seen that, while no startling departure from current practice has been introduced, careful attention

shaft. The latter is provided with universal joints at each end, through which power is conveyed to short cardan shafts on each side, which in turn convey power to the cardan shafts through the intermediary of a spur wheel engaging with an internally-toothed ring rigidly fixed to the road wheels, which latter are carried on spindles turned at the ends of the H section rear axle. The conveyance of the power from the differential shaft to the road wheels by the medium of these specially-jointed cardan shafts certainly permits all rack from road inequalities to be absorbed before damage can result to the gear on the road wheels. The gear-box is of course furnished with ball bearings throughout.

The New Leader Cars.

THE NEW LEADER MOTORS, LTD., Apsley, Nottingham, have contented themselves with displaying only one of their models. The one chosen is the 10-12-h.p., but this is shown in four styles—viz., a polished chassis, a four-seated side-entry phaeton, and two examples of two-seated cars. In general, the models retain the essential features of the 1907 models, but slight modifications have been effected in detail. For example, the cylinders have now a bore of 90 mm. and a similar stroke, whilst formerly the stroke was only 85 mm.; the chassis has been widened, and the back axle redesigned, so that the wheels are now made to run on the outer sleeve. An Oldham joint has been introduced between the clutch and the gear-box, permitting the more easy withdrawal of the male clutch member. The carburettor remains unchanged, and, in view of the 32.7 ton miles per gallon attained in the Scottish trials, it would certainly seem undesirable to vary this appliance. Whilst still marketing the 18-22-h.p., the 24-32-h.p., and the 12-16-h.p. types manufactured, the company are, we understand, making every effort to secure an increase in the popularity of the excellent little 10-12-h.p. chassis, which, according to R.A.C. rating, gives 19-h.p.

The Hotchkiss Cars.

Considerable interest is being taken in the display of the parts of the 45-h.p. six-cylinder Hotchkiss car, which made the long-distance reliability run under the observation of the R.A.C., that are to be seen on the stand of the LONDON AND PARISIAN MOTOR COMPANY, LTD. For the coming season attention is being devoted to three models—a 16-20-h.p. and 30-40-h.p. four-cylinder and a 40-50-h.p. six-cylinder *modele de luxe*, the most striking departure being the substitution of long plain bearings to the crank shaft in place of the ball bearings

Fig. 58.—Chassis of the Hotchkiss 16-20-h.p. Car.

hitherto employed. Fig. 58 depicts the chassis of the new 16-20-h.p. model, which is provided with a four-cylinder engine, having a bore and stroke of respectively 95 mm. and 110 mm. As will be seen from Fig. 59, the cylinders are all in one casting, with the valves all operated off a single cam shaft. The ignition is by high-tension magneto, and the speed of the motor is controlled by both hand and foot levers. The ignition wires are not only well protected, but a different colouring is given to each wire, so that it may be seen at a glance to which cylinder it rightly belongs. The inlet and exhaust passages to all cylinders are cast as part of the water-jacket, thus doing away with a considerable amount of piping and joints. The lubrication is by drip feed on the dashboard, the amount of drip being accurately regulated by plungers, which can be set to drip to the correct amount required for the different bearings. The oil tank is situated near the engine, so that the lubricant is always kept warm, and a constant and even flow ensured.

Fig. 59.—The Hotchkiss 16-20-h.p. Engine with the four cylinders in one casting.

A new type of carburettor—the Grouvelle-Arquembourg—furnishes the mixture, while a feature of the water circulation is the provision of taps at the lowest part of the water-jacket to facilitate drawing off the water in frosty weather. The leather-faced cone clutch, which is entirely closed inside the flywheel, is provided with a simple means of adjustment. A double universal joint is fitted between the clutch and the gear box to allow for any want of alignment between the two

parts. Four speeds and a reverse are provided by a "gate"-controlled gear-box, the shafts of which are of nickel steel, and are mounted upon ball bearings. From the gear-box the power is transmitted to the rear axle wheel through a cardan shaft provided with a joint at each end. These joints are thoroughly lubricated, both of them being covered with a dust-proof cap filled with grease. The rear axle casing is formed of two tubular arms, which are bolted at their inner extremities to a steel case containing the bevel and differential gear, the upper portion of the case being easily detachable for inspection purposes. The rear axle is a very well-designed piece of work; all the parts run on ball bearings, large ball thrusts being also provided to take up the end thrust on the bevel pinions and crown wheel. The live axle casing carries on its end the wheel bearings, which are driven by the live shafts in the usual way, the latter not being required to carry any of the weight of the vehicle. It is a notable feature of the Hotchkiss car that no provision is made in the way of torque rods or radius rods, and, in view of the fact that this feature is retained, it is presumably found to give satisfactory results in practice. Another point of interest, and one which will appeal to motor body builders, is the fact that all the mechanism is kept below the level of the top of the frame. Altogether, the new model is an interesting vehicle, and one which should fully maintain the Hotchkiss reputation. The complete cars on view comprise an exceedingly handsome 30-40-h.p. four-cylinder landaulet and a 40-50-h.p. six-cylinder, also fitted with a landaulet body.

The Hispano-Suiza Cars.

Messrs. WEBLEY AND SCOTT, Weaman Street, Birmingham, are showing through their London agents, the Motor Syndicate, Ltd., of 27, Maddox-street, W., examples of the excellent Hispano-Suiza cars. A chassis of the new six-cylinder 30-40-h.p. type is displayed, as well as a complete vehicle of the 40-50-h.p. four-cylinder type, this being

Fig. 60.—The Hispano-Suiza Six-Cylinder Engine.

fitted with a double phaeton body of Spanish construction, capable of comfortably seating seven persons, with an emergency seat for an eighth. The chassis is of the "Birkigt" type, being essentially composed of two frame plates of pressed nickel steel, connected at the back by a cross-plate of the same metal, and in the front by the engine and change-speed gear. These two parts, constructed independently, are connected by an annular joint ensuring the mathematical centring of the shafts. The mass formed by the union of the engine and gear-box is secured to the chassis by six feet and extensions of the metal sheet close the spaces left free. The whole is bolted together, and offers an efficacious resistance to deformations of any kind, the whole mechanism being thus perfectly protected without resorting to the use of any additional shield. The motor of the 40-50-h.p. type has cylinders with a bore of 130 mm. by 140 mm., whilst the cylinders of the 30-40-h.p. have a bore of 100 mm. by 130 mm. In each instance the cylinders are cast in pairs, with the valves arranged on opposite sides, mechanically operated. Lubrication is effected by pump operated from the exhaust valve cam shaft, the big ends receiving their oil by way of the hollow crank shaft. Hand as well as foot control of the throttle is provided, and the clutch pedal is also connected up to this control, but in such a way as to permit acceleration even when the clutch is fully withdrawn. In the six-cylinder car ignition is by high tension, a Simms-Bosch magneto and independent accumulator equipment being provided, with a separate coil. The clutch is of the disc type, plates of steel and phosphor-bronze being alternately employed. The gear-box is of specially compact design, and is carried very close to the clutch. The transmission is by cardan shaft, the joints running in oil; and, in addition to radius rods, a tapered channel steel torque rod is fitted. The brakes are well arranged, that on the main shaft being provided with mechanism permitting a wide adjustment of the exterior contracting jaws. We were informed that the weight of the 30-40-h.p. six-cylinder chassis without tyres does not exceed 17 cwt., and, if this be so, a reason can be found for the strong claim made that these vehicles are extremely economical in tyres.

The Iden Cars.

An exceedingly novel design of landaulet (Fig. 61) is shown by the IDEN MOTOR COMPANY, LTD., Coventry, the front wheels acting both as drivers and steerers. The engine—a two-cylinder V-type of 12-h.p.—is located under the driver's seat, and in front of it, instead of to the rear, as usual, are the clutch gear-box and cardan shaft, which convey the power to the front axle through bevel gear. The clutch is of the Iden patent metal-to-metal type, and the "gate"-controlled change-speed gear gives three speeds and a reverse. The front axle drives the

Fig. 61.—The Iden 12-h.p. Front-Driven Landaulet.

steering wheels through universal joints in the hubs, while the steering pivots are supported by the forked ends of a casing surrounding the axle. The brakes are also formed in conjunction with the forward pair of road wheels, the arrangement being claimed to furnish a car which is quite free from any tendency to skid. The vehicle is built to carry four passengers inside, and has an extended canopy over the driver's seat, specially built to hold luggage. During a recent trial one of these landaulets was driven up Reigate Hill with four passengers and the driver, and travelled three-quarters of the way on top speed, finishing the well-known gradient on the second speed, a creditable performance for a 12-h.p. vehicle. A 12-h.p. landaulet with the ordinary type of chainless transmission to the rear axle is also on view. This has a four-cylinder engine, with separately-cast cylinders, and the valves all located on one side. All parts of the mechanism are arranged so

Fig. 62.—The Ford 15-18 h.p. Landaulet.

that they can be got at with a minimum of trouble. In view of their general simplicity and sound construction, combined with their very moderate price, the Iden cars are well worthy of attention.

The Ford Cars.

A varied and interesting range of the Ford 15-18-h.p. four-cylinder cars is to be seen at the stand of Messrs. PERRY, THORNTON AND SCHREIBER, LTD. Formerly this car was only supplied as a two-seater, but it can now be equipped with a three-seated body, a side-entrance double phaeton, or a landaulet, an illustration of the latter being given

in Fig. 62. The latter vehicle and the four-seated car are fitted with a longer chassis and stronger axles and springs than the two and three seated models. The four cylinders of the motor are cast in pairs, with the valves all on the same side, and mechanically operated. The ignition is by coil and accumulators, while the circulation of the water is effected by pump. Two speeds and a reverse are furnished by a gear of the epicyclic or planetary type. The final drive is by a single-jointed enclosed cardan shaft to a live rear axle. Expanding ring brakes are fitted to the rear wheel hubs, while the throttle and ignition levers are located on the steering column.

The Speedwell Cars.

The new SPEEDWELL MOTOR COMPANY, LTD., whose new works at Hounslow are practically completed, are confining their exhibit to

Fig. 63.—The Speedwell Back Axle Dismantled.

four examples of the Speedwell 24-30-h.p. cars, one of which we illustrate in Fig. 64. The engine and magnetos now being fitted to these increasingly popular vehicles are of the Aster Company's manufacture. The mixture is furnished by an interesting carburettor provided with triple petrol spraying jets and arranged to give a correct proportion of air and spirit at any and all engine speeds. The lubrication of the motor is effected by a mechanical pump placed in the base chamber, and amongst other advantages it is claimed for this system that with one supply of oil the engine lubrication is carried on mechanically for over 1,000 miles without any attention being necessary. The circulation of air through the radiator is partly induced by the usual belt-driven fan and partly by the flywheel, the arms of which are cast in the form of a ventilator. As regards the transmission, we note that all the gear shafts are kept short and stiff and are mounted on ball bearings, while new features comprise a spring drive and a universal joint, wherein special provision has been made for replacing worn parts. Fig. 63 illustrates the Speedwell Company's special design of back axle, in which the weight of the car is carried by the lower fixed axle, the rotating shafts having only the driving effort to withstand. This was introduced a year ago, and was fully described in the M.C.J. at the time. The system has proved so satisfactory in practice that it has only been deemed necessary to introduce a slight modification in the lower or forged member.

Fig. 64.—The Speedwell 24-30-h.p. Car.

Messrs. Keele's Exhibit.

The well-known firm of agents, Messrs. J. KEELE AND CO., have a neat stand in the annexe, on which are staged examples of the three leading makes of cars for which they have taken the agency for the coming season. These include an example of the 18-h.p. Darracq, fitted with a handsome Roi des Belges phaeton body by Messrs. E. and H. Hora, a 20-h.p. four-cylinder "Belsize" with standard side-entry phaeton, and an 18-22-h.p. "Enfield" with a tulip form double-entry phaeton body. Each of these cars are described in other columns in the review of the stands of their respective makers, and, with such a choice of serviceable vehicles, Messrs. Keele should have but little difficulty in thoroughly satisfying the wants of their extensive clientele.

The Coventry Humber Cars.

The 1908 programme of the Coventry branch of the HUMBER COMPANY comprises two four-cylinder vehicles, 10-12-h.p. and 15-h.p., and a 30-h.p. six-cylinder car. The first-named model, which will appeal to a large number of motorists of moderate means, has been re-designed, a new feature being the adoption of a pressed steel frame. The engine, which, with the gear-box, is supported on a tubular sub-frame, has cylinders 84 mm. bore by 95 mm. stroke. The crank case is now divided horizontally, so that the bottom half can be removed to give access to the big ends without disturbing the bearings. Other detail improvements are found in the pump, which is brought up into a most accessible position, while the contact-maker is located high up at the front of

Fig. 65.—The Coventry-Humber 10-12-h.p. Car.

the engine. The three-speed gear-box, which is made in one piece, is now "gate" controlled. The shafts all run on ball bearings, and the gear strikers are entirely enclosed. The front axle is of tubular construction, terminating in knuckle-ended malleable castings. The 15-h.p. car remains, generally speaking, unaltered, although several minor changes have been made in the details. The engine cylinders are $3\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke. Two systems of ignition are fitted, the magneto being now arranged at the side of the engine instead of under the footboards. The lubrication of the motor is effected by a pump with sight feed. The "gate"-controlled gear-box is fitted with ball bearings throughout. As regards the transmission, which is by a cardan shaft and bevel gear to a live axle, we note that the two joints are now fitted with

The Talbot Cars.

The new 35-h.p. British-built chassis (Fig. 67) is the centre of attraction at the stand of CLEMENT-TALBOT, LTD. The engine is of new design, having the four cylinders, 120 mm. bore by 120 mm. stroke, cast in pairs, with the valves on opposite sides. The carburettor is of the Talbot special automatic type, ensuring a perfect mixture at all engine speeds. The ignition is by high-tension magneto, the firing point being controlled from the steering wheel. A reserve system by coil and accumulators is also provided for, the contact-maker being

Fig. 66.—The Talbot 35-h.p. Engine.

located in a convenient position. The lubrication of the motor is effected by a small pump driven by a cam off the inlet valve cam shaft and located in the base chamber. This forces the oil through sight feeds on the dashboard to the main bearings of the engine, which are drilled through, as is also the crank shaft. The crank shaft journals are also drilled, thus lubricating under pressure the big end bearings. An oil tank is also provided in the usual position on the off side of the chassis frame, this having an exhaust by-pass forcing oil up to the

Fig. 67.—Plan of Chassis of Talbot 35-h.p. Car.

ball bearing pins. The six-cylinder vehicle has the cylinders cast in pairs; the bore is 4 in., and the stroke $4\frac{1}{2}$ in. The details generally follow the design adopted in the four cylinder models, the various parts being, of course, strengthened to adapt them to the greater power. The Humber cars are among the most popular of British-built vehicles, and the new models should fully uphold their reputation.

sight-feed on the dash. The latter can be shut off at will, and is quite independent of the force pump feed. An extra hand pump is also provided. Lubrication is thus efficiently provided for, being entirely automatic and independent of any attention on the part of the driver, a glance at the two sight feeds in the forced pressure circuit being sufficient at any time to show that the constant level in the base chamber

is maintained. The transmission is through a large-diameter, leather-faced cone clutch having buffer spring below the leather, to a "gate"-controlled four-speed gear-box, and thence by cardan shaft and bevel gear to a live axle. The weight of the car is taken by the axle casing, the axle itself driving the hubs of the wheels through its octagonally-shaped ends, and having only the driving effort to withstand. The engine and gear-box are carried on a sub-frame, and the main pressed steel frame is supported on five springs. With the view of increasing the silence of these already quiet cars, duplicate silencers have been

there are many points of interest. The four cylinders of the engine are cast in pairs, and are 110 mm. bore by 130 mm. stroke. The forged steel crank shaft runs in three long phosphor-bronze bearings. A new departure is seen in the ignition, which is by high-tension magneto, the sparking plugs being fitted in the inlet valve caps. In order to facilitate starting, the engine is provided with a half-compression device acting on the inlet valves. The carburettor is a special patent type. The additional air supply and the throttle are controlled by the accelerator pedal, thus simplifying the control to a remarkable degree.

Fig. 68.—Chassis of the Fiat 28-35 h.p. Live Axle Car.

adopted. A 25-h.p. Talbot with limousine body, by Rothschild, is also on view. The four cylinders are cast in pairs, and are 105 mm. bore by 120 mm. stroke. Two systems of high-tension ignition are provided, while the transmission is the same as in the 35-h.p. vehicle. The new 18-h.p. Talbot has an engine comprising four separately-cast cylinders, 90 mm. bore by 117 mm. stroke. The lubrication on this vehicle is by exhaust pressure, a sight-feed lubricator being fitted on to the dashboard. The Talbot cars have earned a high reputation during the past season, their successes in the various hill-climbing competitions having brought them well to the front, a position which, judging from

The aluminium base chamber is cast in two pieces; the lower half serves the purpose of an oil tank for the lubrication of the engine, its capacity being about two gallons. An oil pump fitted on the back of the base chamber is driven by the exhaust valve cam shaft. It draws up oil from the lower part of the base chamber, and forces it into the crank shaft bearings and through the crank shaft to the connecting rod, big end bearings and the gudgeon pins. The superfluous oil is driven out by centrifugal force, and lubricates the cylinders and pistons. As the connecting rods and crank shafts do not dip into the oil, no excess of oil gets past the piston rings into the explosion chamber. Smoking

Fig. 69.—The Bentall 16-h.p. Car. (See page 837.)

an inspection of the new models, is likely to be fully maintained during the coming year.

The Fiat Cars.

Among the cars which deservedly enjoy a high reputation in this country are the Fiat, the success of these Italian-built vehicles in the leading races during the past season having brought them into great prominence. Two new models are to be seen at the stand of FIAT MOTORS, the first being a 28-35-h.p. live axle machine (Fig. 68), in which

and also fouling of the plugs and valves is therefore entirely eliminated, and a minimum consumption of oil ensured. The water pump is of the centrifugal type, driven by a pinion in mesh with the exhaust half-time pinion. The honeycomb radiator is supported on special trunnion brackets, giving a flexibility which minimises the possibility of damage from excessive vibration. The efficiency of the cooling is increased by the action of the flywheel fan drawing air through the radiator. The clutch is of the well-known Fiat steel disc type, but improved in detail. The discs run in oil, and are forced into contact

by means of a spring. The change-speed gear is "gate"-controlled, and gives a direct drive on the top speed. Ball races are fitted to all bearings in the gear-box, and particular attention has been paid to the lubrication. The cardan shaft is enclosed in a casing which is supported at the front end in a crescent-shaped bearing attached to the frame in such a way that the casing as well as the shaft can follow the contour of the road without straining the mechanism in any way. The dismounting of the cardan joint is extremely simple, and can be effected by removing one bolt, while the necessary lubrication is obtained by an oil-tight leather cap filled with grease. The back axle is of exceedingly strong design; the casing is of pressed steel, the two parts being bolted vertically together along the centre line. The axle

Fig. 70.—Sectional Elevations and Plan of the Bental "unchokable" Carburettor.

is furthermore of the arched type, each half of the live axle being set slightly out of the horizontal plane, so that the rear road wheels are splayed about three degrees off the perpendicular. The foot brake consists of a double adjustable band working on a large drum fixed to the cardan shaft. As soon as the pedal is depressed a jet of water is automatically thrown upon the drum in order to keep it cool. The back brakes, which are actuated by a hand lever, are of the internal expanding type. Passing now to the 45-h.p. six-cylinder car, a polished chassis of which is on view, the cylinders are cast in pairs, each pair being in one with the water-jacket. A pressed steel cover placed on the top of each cylinder can be easily removed by simply unscrewing two nuts which allow the cover to be lifted up, thus facilitating the inspection and cleaning of the water-jacket. The valves are all the same size and interchangeable, the inlets being on the right side and the exhaust on the left side of the engine. The crank shaft is of forged steel, the centres of the journals being bored out. It is supported by four bearings of bronze lined with anti-friction metal. The flywheel is of cast steel, of large diameter, and is provided with fan-shaped arms. The lubrication and ignition is on the same system as the 28-35-h.p. car described above. The carburettor is of the automatic type; the air for the mixture is carried from a casing round the exhaust pipe by means of an aluminium pipe, the auxiliary air supply being governed by the opening of the hand and foot controlled throttle, ensuring a perfect mixture at all engine speeds. A branch from the oil circulation is taken to the foot accelerator in order that the pressure of the oil may be used as a cushion to prevent the throttle being jerkily opened. The clutch is of the multiple disc type, greatly improved in detail. The steel discs are of large diameter, half the number being carried by a cylindrical box attached to the flywheel, the other half being mounted on a drum carried by the gear shaft. The change-speed gear is of the sliding pinion type, giving four speeds forward and one reverse. The gear-box is carried by four arms attached to the frame, and is easily detached. The differential shaft, which runs on ball bearings, carries the two sprockets, from which the drive is transmitted to the road wheels by side-chains. Gear cases are now fitted to the driving chains, these being so fitted as to allow the radius rods to be adjusted without difficulty. The frame is made in two lengths—viz., long and extra long, and is constructed of two stamped steel side members inswept towards the front to obtain a wide steering lock. It is held together by cross members, also of stamped steel, and is supported on manganese steel springs. The steering gear is of the worm and segment type, the segment and the spindle being made of forged steel hardened and ground. Lubrication is effected by means of a grease cup attached to the case. The knuckle joints of the steering rods are provided with steel bushes, the pins being also of steel, and provided with grease cups. The foot brake is of the band type, and works upon two drums, one on the fixed gear shaft and the other on the differential shaft, the pressure on the two drums being equalised by a compensating device. Hand-controlled internal expanding brakes working in steel drums are fitted to the back wheels. Shock absorbers are, we may add, provided in conjunction with the springs.

The Bental Cars.

The Bental cars, made by Messrs. E. H. BENTALL AND CO., are staged in two types, the 9-h.p. having two cylinders and the 16-h.p. with four cylinders, the first mentioned being shown fitted with a brougham body having a detachable top. The 16-h.p. (Fig. 69) is exhibited both as a chassis and with two types of bodies, one being a single landaulet with extension front and windscreen, and the other a side-entry touring car. In main features of design but little alteration has been made from the 1907 model; in fact, in the motor the only alteration is the fitting of the Bental "unchokable" carburettor as a standard in all models, low-tension magneto ignition being retained, as are also the method of suspension of the frame, the fibre-faced clutch running in oil, and the form of "locking" change-speed quadrant peculiar to these cars. Some simplifications have been introduced, however, in connecting up the change-speed lever to the operating levers, a ball-jointed rod with long sleeve being provided in lieu of the somewhat complicated system previously adopted, whilst the entry of the operating rod into the gear-box is still at the top thereof, as in previous models. The brake gear has been modified, and both pedal brake and hand lever brake are made to operate quite independently on the rear road wheels. The brake drums carried on the latter are provided with two projecting flanges, the one set of brakes expanding synchronously on the outer flanges, whilst the other set operate on the inner flanges. The type of live axle previously employed is retained, as well as the lubrication of the motor and its half-time gear wheels by splash, the feed being maintained by pressure from the exhaust. The Bental carburettor now universally adopted possesses some novel features of considerable interest. The main detail is that in place of multiple jets with fixed apertures a valve-like arrangement permits of the three minute orifices being enlarged at will until flooding is caused. This is certainly a valuable feature in the case of impurities clogging the jets, more especially as the control is worked from the steering wheel. As will be seen from Fig. 70, the tube P carries the petrol supply to the strainer A, from whence it passes to the float chamber B, which is of the usual type. From B it passes by passage C to the special unchokable jet D, shown enlarged in the centre of the illustration. The jet D is constructed similarly to a valve, and is held against its conical seating by the spring D1. In the conical part of the valve are three grooves E, E1, and E2, through which the supply of petrol normally passes. In the event of any jet getting stopped by impurities, it can be immediately released by depressing the jet valve by means of the plunger F, which also regulates the richness of mixture. As before stated, the plunger F can be raised or lowered from the steering wheel. When lowered the mixture is enriched, whilst continued lowering brings the plunger into contact with the jet valve and depresses it, thus clearing the jets of any obstruction unconsciously on the part of the operator. A similar movement, of course, also floods the carburettor, and this movement can also be controlled from the starting handle. The control of the admission of the gases to the cylinders is effected by the rotating valve G through the lever G1. When moved to the left of the position shown in the drawing the valve is opened and extra air admitted at the same time, whilst a reverse movement causes the valve to be closed, and free air admitted at such times as when running down hill.

The Thames Cars.

An interesting display of the Thames cars is made by Messrs. W. T. CLIFFORD-ELARP, LTD., prominence being given on the stand to

Fig. 71.—The Thames 50-h.p. Six-Cylinder Car.

a fine 50-h.p. car built for Mr. J. Penn, of Norwich. The vehicle is fitted with a handsome limousine body, painted a myrtle green and upholstered in light cloth. A second and interchangeable touring side entrance is provided for the same chassis. The chassis retains the main features embodied in last year's pattern. The engine comprises six cylinders of a bore and stroke of $4\frac{1}{2}$ in. by 5 in. respectively. The carburettor has been improved, and has now a double jet, rotary throttle, and automatic air supply. The lubricating system has received careful attention, the crank shaft being drilled to allow the oil to be forced through it to the upper side of the connecting rod bearings.

The ignition is by high-tension magneto, coil and accumulators being also installed as a reserve. The contact maker and distributor for the latter is driven by skew gear off the rear end of the inlet valve cam shaft. The crank shaft, which is balanced, is supported on four long bearings. A point about the radiator fan is that the aluminium blades, which are of special design, are cast in one with the boss and pulley. The clutch is of the metal-to-metal cone type, running in oil. The gear gives three speeds forward and a reverse. When on direct drive the countershaft is completely out of gear, while it may also be mentioned that the "gate" quadrant and lever connections are all mounted on the gear-box. The final drive is by a well-designed cardan shaft and bevel gear to a live axle. The differential is of the spur wheel type, the sun wheels being cut solid with the driving shafts, which have a dog clutch fitted on the end of each for driving the rear road wheels. The construction of the axle is such that the weight of the car is carried by tubes fixed securely to the axle casing, which prevents any strains, other than the torque due to drive, coming on the driving shafts. Ball bearings and ball thrust washers are provided throughout, and the gear runs in oil. A special adjusting arrangement is fitted for getting perfect adjustment of the bevel pinion with the crown bevel, thereby securing very quiet running. A feature of the car is the arrangement of the rear springs, which act as radius rods, the chassis being, as it were, towed along instead of being pushed. The silencer is of a special condenser type, the gas being taken through a series of small tubes, no baffle-plates being used. The 45-h.p. six-cylinder car is on similar lines, the cylinder dimensions in this case being 4½ in. bore by 5 in. stroke. The ignition on this car is by synchronised coil and accumulators. A new vehicle is seen in a 15-h.p. car fitted with a luxurious landaulet body, an inspection of which shows the chassis to comprise a number of interesting features. The engine, clutch, and gear-box are, for instance, so arranged as to form a single unit, so that

lower horse power has cylinders of 130 mm. bore and 140 mm. stroke, whilst the 50-70 h.p. has a bore of 150 mm. and a stroke of 160 mm. The chassis give evidence of very careful thought in design, whilst from the point of view of manufacture neither finish nor material leave anything to be desired—in fact, it is one of the best of the many excellent new models recently introduced from Italy. The frames are both of pressed steel, swept inwards in the fore part and combined at the rear; and in both cases the side members carry both the gear-box and the motor. The cylinders are cast in pairs, the barrels being separate, but terminating in a single flange plate for bolting to the crank chamber. The valve chambers are all on the left side of the engine, the valves being operated by a single cam shaft. The carburettor, which is water-jacketed, is carried on the valve side of the motor, whilst on the other side is located the shaft actuating the ignition tappets, a Bosch low-tension magneto being employed. The carburettor is not provided with an automatic air valve, but has its piston throttle valve so designed that extra air is proportionately admitted into the mixing chamber as the piston valve is further opened. The petrol feed through the jet is also adjustable in a somewhat ingenious but simple manner, and is not in proportion to the diameter of the petrol aperture. The jet is cut square across on the top, and a square-ended set screw, having an exact parallel face to the top of the jet, is screwed down thereon until the space between the face of the set screw and the face of the top of the jet is such that petrol passes out between them in the proper proportion. A permanent air inlet is provided for the starting and slow running of the engine, but this is closed so soon as the piston throttle is operated for acceleration. The control is both by hand from the steering wheel and by pedal from the footboard. A neat point in the construction of the car is that neither the induction tubes nor the water tubes have joints of any kind. The clutch is of the multiple-disc type, without springs, small studs on alternate discs causing the adjoining plates to

Fig. 72.—Chassis of Züst 18-24-h.p. Live Axle Car.

it is impossible for the various parts to get out of alignment. The engine is of the two-cylinder type, 4 in. bore by 3½ in. stroke. The valve stems are enclosed by a detachable plate. The water-circulating pump and high-tension magneto are located in front of the engine, the spindle driving them being at right angles to the crank shaft, and operated through skew gear. The carburettor is so arranged that the opening of the spraying jet is automatically varied by a needle valve in accordance with the auxiliary air inlet opening. The jet is also exceedingly accessible, the parts above it being so fitted that by loosening a single nut they can be instantly removed in one piece. The lubrication of the motor is effected by a pump in the base chamber. The pedal controlling the metal-to-metal cone clutch also actuates one of the brakes. The three-speed change gear is operated by a lever on the steering column. The final transmission is by cardan shaft and worm gear in place of the usual bevel on the back axle. The chassis is made suitable either for private or public service work. With the exception of the engine, ball bearings are used throughout all the Thames cars, which are splendid examples of modern automobile engineering.

The Züst Cars.

The FARMAN AUTOMOBILE COMPANY, LTD., show on an extensive stand examples of this excellent car, including a 28-40-h.p., fitted with a beautifully designed and finished landaulet, with front extension and wind screen. A polished chassis of the 50-70-h.p. type is also displayed, as well as an example of the live-axle 18-24-h.p. model (Fig. 72), also in chassis form. It may be remarked that whilst the 28-40-h.p. and the 50-70-h.p. are chain driven, the 18-24-h.p. is provided with a live axle and an accompanying propeller shaft. Excepting in the dimensions of the engines the 28-40-h.p. and the 50-70-h.p. are identical in design. The

act themselves as springs. The gear-box is of sound design, and very neat; two sets of driving bevels are employed, the left-hand driving bevel being withdrawn from meshing with its companion on the countershaft when the car is on any speed but the highest. Two brakes are provided on the countershaft—one on either side of the gear-box—both being operated by one pedal. Internal expanding band brakes operating in drums on the road wheels are actuated by the hand lever. In the 18-24-h.p. model the carburettor is not water-jacketed as in the larger types, hot air being drawn from the cylinder walls, but the same adjustable jet is employed. As before remarked, this model is provided with a live axle, which is of the customary "rocking" type. The clutch is similar to those of the large models, whilst a drum of very large diameter on the main shaft behind the gear-box carries an internal expanding brake, the road wheels being furnished with brakes of similar design. Like the larger models, semi-elliptic hanger springs are employed at the rear. Gate change-speed gear is used, and in this case, as the gear-case is carried close up to the clutch, the selector rods are quite short, and are carried in the gear-box instead of in a separate aluminium casing. As in the larger models the flywheel is cast with webs, which act as a fan, inducing air through the radiator. The motor of the 18-24-h.p. type has cylinders with a bore of 100 mm. and a stroke of 130 mm., and in this case Eisemann high-tension ignition is employed.

The La Buire Cars.

Prominent among the excellent French-built cars on view are the La Buire vehicles, shown by the British agents, the HOLLINGDRAKE AUTOMOBILE COMPANY, LTD. Prominence is given to a polished chassis of the 24-30-h.p. six-cylinder model, the feature of which is that the engine (Fig. 73) has the cylinders cast in sets of three, with the valves

on opposite sides. The bore and stroke is respectively 92 mm. by 120 mm. Large inspection doors are fitted to the sides of the base chamber to enable the crank shaft bearings to be readily inspected. The lubrication is maintained by an ingenious form of paddle pump operated off one of the cam shafts, the oil being drawn from a sump in the base chamber and delivering it through eight feeds on the dashboard to the different parts of the motor. The water circulation is maintained by a rotary pump driven off one of the cam shafts. The radiator, which is provided with an air-inducing fan, is of the Apprin honeycomb type. The carburettor is of the La Buire Company's special type, so arranged that when the car is running down hill free the throttle can be entirely closed and only air allowed to pass into the cylinders, thus not only cooling the engine, but allowing it to be used as a brake. The ignition is by Simms-Bosch high-tension magneto, advanced and retarded by a lever on the steering wheel; a novel fitment is also seen in a pedal-controlled switch on the dashboard, enabling the current to be cut off and the engine stopped by a touch of the foot. The clutch is of the disc type, and the gate-controlled change-speed gear gives a direct drive on the top speed through the cardan shaft and bevel gear to the live axle. The differential gear is of a special type patented by the La Buire Company; it allows of the back axle casing being arched, which gives extra strength to this important part. From Fig. 75 it will be seen that the driving bevel spindle B is carried right across the differential gear case in ball bearings. The right portion of the live axle E is rotated by the bevel pinion C meshing with the larger crown wheel, while the left part E is driven by the driving bevel pinion D meshing with the smaller crown wheel. Both the bevel pinions are carried on a hollow sleeve produced inwards, and carrying at their inner ends the sun wheels F. These in their turn mesh with four satellite bevel pinions carried on the spindles of a star piece in the usual way. The gear ratios of the two pairs of bevel gears are alike, although the number of teeth in each pair of wheels is not equal. By this arrangement it is

Fig. 73.—The La Buire 24-30-h.p. Six-Cylinder Engine.

possible to give a slight degree of angularity to the live axles of the rear road wheels. The frame is of pressed steel, narrowed in front to increase the lock of the steering wheels, and raised at the rear to give clearance to the differential; the rear springs (Fig. 76) are of the full elliptical type, while ball bearings are, it is almost needless to add, employed to all parts except the engine. The car has the usual foot-operated brake on the gear, while those on the rear wheel hubs can be actuated either by hand or foot. Another new vehicle intended for use as a town carriage is a 10-14-h.p. model, the four cylinders (75 mm. bore by 120 mm. stroke) of the motor being in one casting, and with the valves all on one side; except that the gear only gives three forward speeds, while the 24-30-h.p. has four, the general arrangement is the same. Those motorists who have a *penchant* for speed will be interested in the smart little 15-20-h.p. *voiture de course* to be seen at this stand.

The Deasy Cars.

The DEASY MOTOR CAR MANUFACTURING COMPANY, LTD., are producing three models for the coming season—viz., 25-h.p., 35-h.p., and 45-h.p. The first mentioned is practically an evolution of the 24-h.p. of the present year, and, generally speaking, the essential features are common to all types. The improvements made are rather of detail than of principle, although many of the alterations effected are of interest. The three-point suspension of the frame is superseded by a four-point suspension, and, whilst the frame itself is still constructed of ash with steel fitch-plates, the practice of sweeping in the fore part of the side members is done away with, and the sides are now straight between their extremities, except in the highest-powered type, where an upward sweep is given at the rear. Whilst the clutch remains the same in construction, the method of its operation is different, and a greater smoothness of engagement and disengagement is certainly secured. The foot brake now acts on a drum placed in front of the universal joint, the contracting band being of wide diameter.

In other particulars the gear-box and propeller shaft remain the same, excepting that the sleeve of the shaft is now of steel instead of aluminium, as heretofore. The live axle remains as before, excepting that, as in the case of the propeller shaft, the aluminium casing previously employed has been replaced by a sleeve of steel. In addition to other modifications in the frame, previously mentioned, the rear end member is now varied, inasmuch as steel tube of cylindrical section

Figs. 74 and 75.—Sectional Elevation of La Buire Arched Rear Axle and Enlarged Sectional Plan of Differential Case.

is employed to couple up the side members in lieu of the ash and steel fitch-plate previously utilised. In the motor and its mechanism the principal change has been made in the suspension of the former; it is now carried on short arms bolted direct to the sides of the frame, its suspension on springs having been abandoned. The only other notable change is the giving up of the bridge piece over the valve chambers and the screwing in of the plugs in substitution. The roller couplings of the control rods have been increased in size, and the facilities for dismantling the magneto have been considerably increased. A finished example of the 35-h.p. car, first seen at Brooklands in the early autumn, fitted with a luxurious limousine body, is displayed on the stand, as well as one of the 45-h.p. type fitted with a two-seated body of more or less racing design.

The Penman Motor Car Bodies.

Mr. A. C. Penman, of the MOTOR CARRIAGE WORKS, Dumfries, has managed to convey to visitors to the Exhibition some idea of the extremely well designed and constructed bodies which are built by him in the far North. The least ornate of those displayed is fitted to a North British Drummond chassis of 16-20-h.p., and takes the form of a side-entry touring car in natural walnut wood, the centre panels being relieved by *papier-mâché* imitation cane work; the upholstery is carried out in imperial red polished buffalo hide. A double extension hood and wind screen is fitted with luggage carrier in the rear. Perhaps

Fig. 76.—Rear Spring Arrangement on the La Buire Car.

the most novel and interesting feature of this body, however, is that the interior is provided with double floor board, the upper being hinged in two halves and so arranged that it is capable of being folded, and by means of a rack made to assume an inclined plane of any desired angle, thus forming an exceedingly comfortable foot rest. Another body takes the form of a *landauet de luxe* finished in dark holly-green, relieved in fine lines of two lighter shades, and provided with front extension and

wind screen, fitted to a 20-h.p. Deasy car. Another fine example of the carriage-builder's art is mounted on an Arrol-Johnston chassis, and takes the form of a very luxurious and commodious limousine. Its leading feature is that the whole of the upper part is dismantlable from the lower panels, leaving when removed a most elegantly-formed open touring body. The jointing is so skilfully done that the closest examination is necessary to detect it. A distinct novelty is displayed in a new front glass screen, which gives the chauffeur an uninterrupted view without the intervention of glass, and at the same time prevents the admission of rain or strong air currents. In the main screen is an

Fig. 77.—Sectional View of Horch new Multiple Metal-to-Metal Ring Clutch.

opening on the vision line, and this is guarded by two pieces of glass carried in neat metal brackets, inclined at opposite angles above and below the opening. The upper inclined glass projects farther than the lower, and is carried at its upper extremity into close contact with the screen glass; the lower inclined glass ends some distance from the main screen, the air currents and the rain thereby finding a vent. The appliance is apparently practical, and furnishes one of the best solutions yet offered of that very complicated problem of giving protection and yet a view uninterrupted by accumulations of rain spots.

The Horch Car.

The HORCH MOTORS, LTD., of Shaftesbury Avenue, London, W., display an example of their 18-22-h.p. car, fitted with a landaulet body, with front extension and wind screen by Maythorn, of Biggleswade, and a chassis of their new six-cylinder 50-60-h.p., want of space precluding the staging of their popular 35-40-h.p. four-cylinder car. The new production follows very much on the older lines of the firm's four-cylinder models, the cylinders of the engine being cast in pairs, the overhead inlet-valves being actuated by rocking levers, to which motion is communicated by long tappet rods worked from the same shaft as that operating the exhaust-valves. The latter are immediately under the inlet valves, the valve-box being on the left side of the engine. The cylinders have a bore of 115 mm. and a stroke of 128 mm. The carburettor is of the multiple-jet type, and is placed very high. In order to equalise the suction of each pair of cylinders, a baffle plate is placed in the main induction chamber, from which are three leads to each pair of cylinders, the firing order being one, two, three, six, five, four. The crank chamber is cast with a web plate, which also forms an apron, and provides a means of suspension to the side members of the frame. The crank-shaft is carried on plain bearings, a journal being provided between each pair of cylinders. Magneto ignition is fitted, and this device, as well as the mechanically-driven pump, is actuated through fibre dog clutches. Lubrication is by pressure to the dashboard, and thence by six force pumps operated from the cam shaft to the desired points. The exhaust pipes are provided with expansion joints. The clutch is metal-to-metal, of peculiar construction. It is shown in section in Fig. 77; it consists of a series of split rings of the nature of piston rings between two telescoping drums, arranged in such a manner that when one of the drums is moved in the axial direction, or the two drums are moved one against the other, the coupling rings are each pressed against the inner and the outer surface of the drums, whereby a coupling of the two drums is effected. The fly-wheel, A, is provided with a sleeve or drum, B. A drum, D, mounted on the

clutch shaft, is inserted in the sleeve, B. Between the inner surface of B and the outer surface of D are placed split rings, F, having triangular cross sections, and kept in position by means of a ring, G, in the drum, B. A spiral spring, H, presses the driven drum, D, against the friction rings, so that in consequence of their oblique surfaces the latter are pressed against the inner surface of the drum, B, as well as against the outer surface of the drum, D. The gear-box gives four forward speeds, the shafts all having double ball bearings at the rear end, some four inches intervening between each bearing. The propeller shaft is provided with universal joints of peculiar design, which possess points of great merit. In addition to the contracting brake on the main shaft at the rear of the gear-box, which is worked by a pedal, two internal expanding brakes operate on drums on the rear road wheels, the rings being placed side by side, one set being worked through a pedal and the other by the hand lever. When this latter is used, the gear lever is retained locked in a neutral position. The whole exhibit is a thoroughly interesting one, the clutch, universal joints, and carburettor all meriting very close examination.

The Vinot Cars.

Messrs. W. COLLE AND SONS, LTD., of Kensington High Street, London, W., in addition to displaying several very fine examples of carriage bodies constructed by them, also exhibit on their stand the 16-24-h.p. Vinot cars in the latest type, but the six-cylinder car (Fig. 78) with chain drive is not shown, nor is the new 12-16-h.p. model with cardan shaft transmission. The Vinot chassis fitted with bodies are of the chain-driven 16-24-h.p. and 24-32-h.p. types, already so well and favourably known. In the last-mentioned case a very handsome de luxe limousine is provided, every possible refinement in the way of fittings—folding armed subsidiary seats, &c., being brought to the aid of a very harmonious whole. The limousine is of the rotund or "Berlin" form, and has glass panels at the sides, corners, and at the rear. The flat windows and lights are furnished with silk blinds. The colour scheme of the exterior is in the very darkest and richest burgundian red-brown, with black mouldings, the centre panels being relieved in rich carmine, the lining-out being effected in dark vermilion. On the 16-24-h.p. type a landaulet limousine is fitted, the panels being carried out in dark green with black mouldings, and the lining is carried out in a very light shade of green. Turning to the new 16-24-h.p. Vinot chassis, the motor and its accessories remains the same as in the chain-driven model of 1907, the only difference being that the fan to the radiator is driven off the other cam shaft, and that it is now carried in an eccentric bearing permitting infinite adjustment; the clutch is varied slightly, and cardan joints are fitted between it and the gear-box. The control of the engine is by throttle only, the ignition being fixed. Lubrication is by pump to dash, and thence by gravity. Either three or four speeds are provided, the gear-box and road wheels now being provided with ball-bearings. The brake on the main shaft, as well as those on the road wheels, are of the internal-expanding type with copper liners. The five axle is of strong design, and full provision is made for accessibility to the various working parts. Whilst in general design following out well-established

Fig. 78.—The Vinot Six-Cylinder Engine.

practice, the new Vinot is very cleanly designed, and well constructed. The most novel feature of the new model consists in the extremely ingenious change-speed lever selecting and locking device; by means of pins working in cams the various selector plates are operated, and the remaining speeds automatically locked. A trigger on the control lever unlocks the backward selector guide, and, on this gear being withdrawn, it automatically falls and again locks itself. We may add that the British concessionaires for the Vinot cars are Messrs. T. J. Harman and Co.

The Scout Cars.

The Scout cars of Messrs. SCOUT MOTORS, LTD., Salisbury, are staged on a commodious stand in the annexe, and comprise examples of the two-cylinder 12-h.p. type, and the four-cylinder 15-h.p. and 20-h.p., and six-cylinder 30-h.p. The 20-h.p. is fitted with a double landaulet body of excellent design, the 15-h.p. and 30-h.p. having five-seated touring phaeton bodies, and the 12-h.p. a four-seated body with side entry of simple design, but very comfortable and roomy. The engines of all types have their cylinders cast separately, the bores and strokes being respectively 90 mm. by 115 mm. in the 15-h.p. and

Fig. 79.—The Scout Six-Cylinder Engine.

102 mm. by 115 mm. in the 12-h.p., the 20-h.p., and the 30-h.p. All types are provided with three forward speeds, direct drive of course being given on the top gear. Ball bearings are employed throughout the chassis and gear-box, and transverse rear springs are fitted to all models. Many refinements are to be found in the general construction, and include the provision of a dial and needle carried on the bottom end of the vertical commutator shaft, the needle designating the number of the cylinder which is next in order to fire. The flywheel is divided up in its periphery also with tell-tales which, when brought into line with a fixed pointer, show the suction, compression, firing, or exhaust strokes of each cylinder. Perhaps the most novel of the new features introduced for the 1908 season is in the male portion of the clutch, which is of the ordinary cone type. Instead of being furnished with the leather face and the three buffer springs previously employed, this member is now provided with cork studs. These studs are in section

Fig. 80.—The Vulcan 40 h.p. Six-Cylinder Engine.

about the size of an ordinary bottle cork, and about one-half the length of a wine cork, and are driven into suitable bosses formed in the aluminium casting which forms this member. It is claimed that this departure ensures greater graduation of engaging and disengaging, and that, even when water or oil is placed on the surface of these studs, the slip is no more than is necessary, and that in actual transmission of the power they are more efficient than any other facing material. Claim is also made for decrease in expense and greater ease in replacement. The firm also make high claims for their arrangement of induc-

tion pipes, whereby an equal supply of gases to each cylinder is assured.

The Vulcan Cars.

The VULCAN MOTOR COMPANY, LTD., Southport, the agents for whom are the London and Parisian Motor Company, Ltd., have an excellent display of moderately-priced cars, ranging from a 14-h.p. four-cylinder to a 40-h.p. six-cylinder. The latter is the company's latest production, and will well repay inspection. The engine (Fig. 80) has the cylinders cast in three pairs, the bore and stroke being 4 in. by 4½ in. The valves are arranged on opposite sides, operated off separate cam shafts, and there are two systems of ignition—magneto and accumulators, the latter having a synchronised high-tension distributor. The clutch is of the leather-faced cone type, and the gear-box, which is controlled by a lever working in a "gate," is adapted to give four speeds forward and a reverse, with direct drive on the third speed. The transmission is by a cardan shaft and bevel gear to a rear live axle. The latter has only the driving strain to withstand, the weight of the car being carried by the axle sleeve. The power is communicated to the hubs of the rear road wheels by dog clutches on the ends of the live shafts. The latter are so arranged that they can be withdrawn, enabling the large bevel wheel and differential gear to be lifted out. The details of the vehicle are all on modern lines; for instance, a joint is provided between the clutch and gear-box to allow for any want of alignment between the two parts, and also to enable either to be dismantled without disturbing the other. The engine is provided with both foot and hand control, and the car is adapted to receive any type of carriage body. We may add that ball bearings are used to all parts, except the motor. The Vulcan 25-30-h.p. car is on similar lines to the foregoing, the main difference being in the engine, which comprises four cylinders; 4½ in. bore by 4½ in. stroke. The 14-h.p. Vulcan differs in but few respects

Fig. 81.—The Vulcan 14-h.p. Double Phaeton.

from the 25-30-h.p.; the cylinder dimensions are 3½ in. bore by 4½ in. stroke. The ignition is by high-tension magneto, a reserve by synchronised coil and accumulators being also provided. The carburettor is of the automatic type, of simple design. The distributor is placed at an angle in an accessible position in front of the engine. The two ignitions have distinct wiring circuits with separate plugs, these being fixed in V-shaped carriers over the inlet valves. The lubrication is effected by pressure from the exhaust through sight feeds on the dashboard. The clutch is of the leather-faced cone type, with the spring placed above and exterior to the shaft. The change-speed gear, which is "gate"-controlled, gives three speeds forward, with, in this case, direct drive on top. In the Vulcan cars the design is such that each part of the transmission can be taken down without disturbing any of its neighbours. Ball bearings are used to all parts except the engine. The rear of the chassis is supported on three-quarter elliptic springs. Altogether, the Vulcan cars bear evidence of careful and well-thought-out design, and their moderate price should bring them many purchasers.

The Critchley-Norris Cars.

The CRITCHLEY-NORRIS MOTOR COMPANY, who have hitherto confined their attention to industrial motor vehicles, make their debut with an interesting pleasure car in the shape of a 35-40-h.p. landaulet. The engine, a four-cylinder Crossley, has the cylinders cast in pairs, with ignition by low-tension magneto. The clutch is of the expanding metal-to-metal type, and on the shaft between it and the gear-box universal joints are provided, which prevent undue strains being set up when travelling over rough roads. A special feature is the Critchley-Norris gear-box, which is made without any horizontal joint, a large inspection cover being provided at the top. The removal of the end plate allows of the easy withdrawal of all the gears. The differential is enclosed in the same casing, but has a separate inspection cover. The change-speed gear is controlled by a "gate" lever. The final drive is by side chains to the rear road wheels.

The Brasier Cars.

The display of Messrs. MANN AND OVERTONS, LTD., includes an example of the well-known Brasier 30-40-h.p. car, which has undergone but little change in design, for which they are British agents. The four cylinders are cast in pairs, with the valves all arranged on one side; the dimensions being 112 mm. bore by 130 mm. stroke. The crank shaft is *desaxé*—that is to say, it is slightly out of line with the centre of the cylinders. Ignition is by low-tension magneto, the operating shaft being located overhead, with the strikers so arranged that each may be taken out independently of the others. The carburettor is of the automatic type, the additional air supply for the mixture being regulated automatically by means of a small conical valve. The leather-faced-cone type of clutch is retained, a double-jointed shaft connecting the clutch with the gear-box. The latter is adapted to give four speeds forward and a reverse, with single operating lever working in a "gate." On the top speed the drive is direct to the differential shaft, from which the power is conveyed to the rear road wheels by side-chains. Ball bearings are fitted to all parts except the engine.

The Weigel Cars.

WEIGEL MOTORS, LTD., have two of the British-built Weigel chassis on view—25-h.p. and 40-h.p., both fitted with four-cylinder engines and live axles. The 25-h.p. is the new model, but as this was fully described in a recent issue of the *M.C.J.*, it need only be mentioned that the cylinder dimensions are 110 mm. bore by 120 mm. stroke, and that the specification comprises high-tension magneto ignition, centrifugal pump, fan-assisted honeycomb radiator, multiple-disc clutch, three speeds forward, with direct on top, rocking "gate" change-speed lever, cardan shaft to special live axle, and ball bearings throughout, except engine. The 40-h.p. car has cylinders 130 mm. bore, 140 mm.

Fig. 83.—Sectional View of Weigel Steering Gear.

stroke. In this case low-tension magneto ignition is employed, the make-and-break mechanism being readily dismountable. To facilitate starting, a special half-compression device is provided in connection with the exhaust valve cam shaft. The transmission gear is substantially designed, and we may add that ball bearings are used to all parts, except the engine.

The Reno Cars.

The REX MOTOR MANUFACTURING COMPANY, LTD., Coventry, have a very commodious and well-designed stand, upon which they display two examples of their new 13-16-h.p. "Reno" car (Fig. 84), one as a chassis and the other as a complete car, with standard side-entry body. The motor is of the four-cylinder type, with each member cast separately, the bore being 86 mm. with a stroke of 110 mm., and the valves disposed on opposite sides. The distribution gear is entirely enclosed, and the shafts driving the high-tension magneto and pump are provided with cardan joints to ensure perfect alignment. The pistons are an extremely light casting, a series of countersinkings in the interior being formed in the spaces between the piston rings. The valve tappets are of ingenious design, being kept up to their work by springs, fibre under-buffers being provided to prevent noise. The Trier and Martin triple-jet carburettor is fitted. The crank case is divided horizontally, the main bearings being attached to the top half, so that they are not disturbed when the bottom half is removed, enabling the big ends of the connecting rods to be adjusted with ease. The engine is lubricated by pressure feed from the dashboard. The crank case is partitioned off for each respective cylinder to ensure the

proper distribution of the lubricating oil in each piston. Three forward speeds are provided, the top, of course being direct, whilst ball bearings are fitted throughout. The back axle is especially interesting. The brake and spring brackets are attached to the bevel gear-box by means of substantial steel sleeve tubes screwed into the latter. The balance gears are contained in a cage bolted to the bevel wheel, which forms part of the cage, the whole revolving in large ball bearings having $\frac{3}{4}$ in.

Fig. 83.—Chassis of Reno 13-16-h.p. Car.

diameter balls; these bearings are adjustable from the outside by means of lock rings which work on plungers behind the ball races. The lock rings are held in position by set pins placed conveniently for adjustment. The bevel pinion is supported by ball bearings at both back and front, in addition to the ordinary ball thrust bearing. Thus, by means of the double set of bearings above and below the teeth of the pinion, the driving pressure is resisted in a way that is impossible with a single bearing, and the cardan joint is also relieved of strain. The lock rings to both bearings permit of the most intimate adjustment, and are readily accessible. Another interesting point is the provision of a double torque rod working in a universal joint; a tension rod is also fitted. In all other details the best accepted practice has been followed, and, as a whole, the new vehicle is a noteworthy production, especially in view of its relatively low price.

The Austin Cars.

The AUSTIN MOTOR COMPANY, LTD., are showing 18-24-h.p., 40-h.p., and 60-h.p. models, the latter having a six-cylinder engine. The cylinders are separately cast, and the valves are on opposite sides. A feature is the employment of two high-tension magnetos, one being utilised for firing the engine at normal speeds, while for high speeds the smaller machine is employed. The transmission is by a cardan shaft to a live axle of substantial character.

The "Times" System Automobile Company, Ltd.

This company make an attractive display, the well-known Darracq racing car, which earned its laurels in winning the Vanderbilt cup, being

Fig. 84.—The Rex Company's 13-16-h.p. "Reno" Touring Car.

placed in a prominent position. A 50-h.p. six-cylinder Darracq with a most luxurious "Grand" limousine body is shown, as is also an example of that make of 8-10-h.p. car with a two-seated body. The remaining vehicle exhibited is one of the new type of 14-16-h.p. Darracq cars with the gear-case combined with the live axle and fitted with a four-seated side-entry body of standard design by Vedrine, of Paris. This is the only example of the new Darracq of this horse-power displayed in the Exhibition. The company by their system of trading have secured a vast *clientèle*, and at the time of our inspection we noticed that the Right Hon. John Burns was an interested visitor on the stand.

The Piccard-Pictet and Rochet-Schneider Cars.

The novelty at the stand of Messrs. **DONNE AND WILLANS, LTD.**, is the chassis of a new Swiss-built car, made by Messrs. Piccard, Pictet and Co., of Geneva, for which they have secured the British agency. The range of models includes 12-16-h.p., 18-24-h.p., and 28-40-h.p. four-cylinder, and 28-40-h.p. six-cylinder, the one on view being a polished chassis of the 18-24-h.p. type. A feature of the design is that the engine

Figs. 85 and 86.—The Piccard-Pictet 18-24-h.p. Car. The upper illustration shows the chassis, while the lower one gives a view of the vehicle fitted with a side-entrance touring body.

clutch and gear-box are built up in the form of a block, supported directly on the side members of the pressed steel frame. The engine has its cylinders—100 mm. bore by 120 mm. stroke—cast in pairs, with the valves arranged on opposite sides. The ignition is by the new Bosch low-tension make-and-break plugs, illustrated in the last issue of the *M.C.J.*, although a high-tension magneto can be fitted instead if desired.

springs are fitted at the rear of the chassis. Altogether the new chassis makes a good impression. The display of the well-known Rochet-Schneider cars comprises a 16-20-h.p. five-axle chassis, a 16-20-h.p. limousine landaulet, with body by Messrs. Million, Guet and Co., and a 16-20-h.p. single landaulet by the Automobile Carriage Builders, Ltd., both being luxuriously finished. So far as the chassis is concerned, the

Fig. 87.—The Unic Four-Speed Gear-Box.

design has undergone but little change. The motor is provided with high-tension magneto, and a new carburettor known as the Zenith, which is of novel design. The petrol supply is now pressure fed, while the gear-box has been changed to give four speeds forward in place of the three previously fitted.

Fig. 88.—The Unic 16-20-h.p. Touring Car.

The carburettor is of special design, and is claimed to furnish a perfect mixture between a wide range of engine speeds. The clutch is of the metal-disc type, and the "gate"-controlled change-speed gear gives four speeds with direct drive on top, through the cardan shaft and bevel gear to the live axle. The latter is of an excellent design, and is provided with pressed steel torque bar, extending from the differential case to a cross member in line with the forward universal joint; it is hinged to provide for lateral as well as vertical motion. Three-quarter elliptic

The Unic Cars.

Messrs. **MANN AND OVERTONS**, at their stand in the Annex, are drawing the attention of the motoring public to the new 16-20-h.p. Unic, Fig. 88, which has many points of interest, the chassis not only being on sound lines, but offered at a very moderate price. The four cylinders of the motor are cast in pairs, with the valves on opposite sides; the bore is 87 mm. and the stroke 110 mm. Several alterations have been made in the new model; for example, the low-tension magneto system

has been superseded by a high-tension magneto. The carburettor is of a simple automatic type, which has proved very economical as regards fuel consumption. The auxiliary air supply is regulated by the action of the suction of the engine on a mushroom valve, and in order to avoid an irregular movement of the valve, the end of the valve stem is fitted with a piston, which works in a cylinder filled with glycerine. The throttle is of the sliding piston type, and is fitted over the carburettor.

Fig. 89.—Rear View of Chassis of the 14-20-h.p. Badminton Car.

The clutch is of the leather-faced-cone type, and a joint is introduced in the shaft connecting it with the gear-box. The gears (Fig. 87) give four speeds and reverse, instead of three, and the control is by a "gate" lever. The transmission is by a cardan shaft to the back axle, which is of solid construction, and fitted with ball-bearings, besides being protected from road shocks by two stout tension rods. We note that a special form of shock absorber is fitted in conjunction with the springs. The exhibit also comprises a 10-12-h.p. doctor's car. This vehicle has already been described in the *M.C.J.*, so it will suffice to mention that the engine comprises two cylinders 102 mm. bore by 110 mm. stroke; and that the transmission is through a leather clutch, a ball-bearing gear-box giving three speeds and a reverse, and a direct drive on the top through a cardan shaft and bevel gear to the rear live axle. The chassis is of the same type as that employed in the large number of Unic cabs now running in London. We understand that a six-cylinder Unic is also being introduced.

The Badminton Car.

The new car (Fig. 89) of BADMINTON MOTORS, LTD., in which Messrs. Teste and Lassen are interested, makes its debut at the show. The vehicle is of 14-20-h.p., and while following the general lines of live-axle vehicles, comprises several interesting details, notably as regards the clutch and cardan shaft. The four-cylinder engine, which is 90 mm. bore by 110 mm. stroke, is provided with an automatic carburettor and high-tension magneto ignition. Lubrication is by exhaust pressure, with sight feeds on the dash. The petrol is gravity-fed from a tank under the front seat. Control is by ignition and throttle levers on the steering wheel and foot accelerator. The clutch is of the disc pattern, alternate bronze and steel plates of rather greater thickness than usual being employed. The gear-box, which is "gate" controlled, gives four speeds forward and a reverse. The cardan shaft is entirely enclosed in a casing, which acts as the torque rod; it extends from the differential case to a crescent-shaped piece pivoted to one of the cross members of the frame. The cardan shaft and casing are thus free to adjust themselves to the inequalities of the road. The differential case is so made that the top half can be readily removed to give access to the bevel gear. The weight of the car is carried by the axle sleeves, the axle itself driving the road wheels through their square ends, which fit in corresponding recesses in the hubs. Ball bearings are used throughout the transmission. An interesting feature in connection with the brakes is that they are readily adjustable by wing nuts. The vehicles are of French design, but of British construction, the combination resulting in a car which is likely to become a popular type in the near future.

The Metallurgique Cars.

The METALLURGIQUE CARS AGENCY expose examples of their various models—12-14-h.p., 24-28-h.p., 26-h.p., 32-h.p., and 40-45-h.p.—the whole being shown in show-finished chassis form. The 12-14-h.p. car (Fig. 91) has two cylinders 100 by 110 mm., the valves being placed on one side of the engine, and all vertically operated off the same cam shaft. In the standard models ignition by accumulators is adopted, but in the example shown provision for a high-tension magneto is made as an extra.

The firm's standard metal-to-metal clutch and spring drive to road wheels through a cardan shaft is fitted, and ball bearings throughout the vehicle with the sole exception of the motor. The gear-box, of the makers' customary neat design, provides three forward speeds and reverse, with direct drive on top. The chassis is inswept at the front, and is cambered at the rear. The change-speed lever works in the usual type of sector. The radiator in this model is of the gilled-tube type, with fan, and the circulation is on the thermo-siphon system. The rear road wheels are fitted with two internal-expanding brakes, the action being synchronised by the customary linked lever, whilst a contracting brake is provided on the drum containing the spring drive at the tail end of the propeller shaft. Both a torque rod and radius rods are fitted. The 24-28-h.p. is a four-cylinder chassis on very similar lines, varied where necessary in accord with the increase in power, &c. The motor has four cylinders of 102 mm. bore by 125 mm. stroke, the valves being arranged on the one side, and vertically operated off the same cam shaft. In this case duplex high-tension ignition is fitted, the distribution gear for the magneto in this instance being entirely enclosed, and a gear-driven pump being fitted for the water circulation. Control is effected from the steering wheel, with foot accelerator, and "gate" change-speed control is provided. The chassis is inswept and cambered, whilst the rear suspension is from semi-elliptic spring hangers. The two remaining models of 26-32-h.p. and 40-45-h.p. have motors of a different type, the inlet valves being placed on the top, the tappets controlling them being worked from the same cam shaft as that operating the exhaust valves. In both these models the other details are much in line with those previously described, excepting that four speeds are provided, and that in the more powerful type three sets of brakes are fitted, an independent foot pedal controlling a contracting brake placed immediately behind the gear-box. In the 26-32-h.p. model displayed, the radiator is placed angularly from the centre point of the front, whilst in the heavier type the flat radiator is retained.

Figs. 90 and 91—The Metallurgique Two-Cylinder Car. The illustrations show respectively the engine and the rear view of the chassis.

The Germain Cars.

Captain THEO MASUI has, as usual, an interesting display of the well-known Germain cars, comprising 14-h.p., 18-h.p., and 28-h.p. four-cylinder and 50-60-h.p. six-cylinder. The feature of the Germain motors is the employment of steel cylinders with brass water-jackets. The

14-h.p. and 18-h.p. models remain unchanged, except for improvements in detail. The six-cylinder car (Fig. 93) has separate cylinders. The valves, which are all mechanically operated, are located on opposite sides. The crank shaft is of a special design, the usual wide bearing between each of the crank throws being replaced by discs formed solid with the shaft; the periphery of the discs is grooved out to form cups or valves for ball bearings, the corresponding outer cups being made in large diameter rings carried in the lower half of the crank case. The ignition is by Eisemann high-tension magneto, a novel feature being the coupling up of the governor to it, so that the sparking is automatically advanced and retarded. An auxiliary ignition by accumulators, in which the magneto distributor is employed together with its coil, can

Fig. 92.—Sectional View of Additional Clutch at Rear of Gear Box on Germain Cars.

be fitted if required. The speed of the engine is regulated by means of a lever on the steering-wheel acting on a variable lift to the inlet valves. A pedal also operates a throttle on the induction pipe. The clutch is of the multiple disc type, the spring being external and located above the main shaft, so that it is readily accessible. The change-speed gear gives three speeds forward and reverse, and is controlled by a lever, which works in a straight-through quadrant constructed so as to do away with the necessity for a trigger on the lever itself. The quadrant is mounted on small springs so that it is forced bodily outward when changing gear, and flies back into position directly the lever comes opposite to a notch. On the top speed the drive is direct, this being obtained by sliding one of the pinions within an internally-toothed wheel. A new departure in this car, as also in the 28-h.p., is seen in an addition to the rear of the gear-box, in which is a clutch consisting of a spur wheel B meshing with an internally-toothed ring. The wheel

readily drawn out. The sleeve is made in four parts, the two tubular portions being secured to the differential casing, which is itself divided horizontally. The differential gear is of the spur pinion type. A substantial torque rod extends from the axle casing to one of the cross members of the frame, on which it is supported in a spring bracket. One of the complete cars on view is fitted with a Pullman limousine body, making it easy for ladies to step into the car. The door is also very wide, and this is attained without taking any room from the front seats. The interior is very roomy, having four comfortable seats facing forward, folding tables, and other conveniences. The other car is fitted with what is termed a "Prince Albert" body, which is exceedingly roomy and comfortable, the back cushions being higher than usual. A victoria leather hood is fitted in order to protect the front seats in wet weather; a leather extension is fixed to the uprights of the front glass screen. The latter is of a new and ingeniously-arranged design known as the "Hanover." It is composed of two hollow uprights, which are held in special fittings on the dashboard. On the uprights is a slotted bronze sleeve with two projecting arms which support the screen and free to slide up and down. The sleeves are held to the uprights by simple pressure manipulated by a small worm lever, which holds it in any position required. The glass screen is suspended from the projecting arms by hinges. At the bottom of the frame is a roller blind of waterproof material, and at the low end of the blind a small hollow tube, which attaches to the dashboard by two little knobs and the pressure of two springs, and so enables the blind to be rolled up and down to any length required. The glass screen can be placed in any desired position without the need of spanner, bolts, or screws, or any complicated fittings.

The De Dion Cars.

The chief exhibit of interest at the stand of DE DION BOUTON, LTD., is the new 12-14-h.p. four-cylinder model. The engine has its cylinders cast in pairs, the specification including mechanically-operated valves, forced feed lubrication, high-tension magneto ignition, automatic carburettor, vertical gate change-speed gear, gear drive through De Dion Bouton cardan back axle. The 8-h.p. single-cylinder car with expanding clutch gear is practically the same as last year. A 30-h.p. limousine with four-cylinder engine is shown, as also one of the cars which successfully made the journey from Pekin to Paris.

The Britannia Cars.

Three four-cylinder—12-16-h.p., 20-h.p. and 24-h.p.—and two six-cylinder models—30-h.p. and 40-h.p.—will form the 1908 series of cars turned out by the BRITANNIA ENGINEERING COMPANY, LTD., of Colchester. From an inspection of the new 24-h.p. chassis on view we note that several improvements have been effected. The four cylinders are cast in pairs, and the bore and stroke is respectively 110 mm. by 134 mm. The valves are actuated by two cam shafts, the inlets being arranged on the opposite side to the exhausts. The carburettor is of a special automatic air-regulating variety, so arranged that when the engine is running at a slow speed, as, for example, when the car is standing, the extra air inlets are closed, and the petrol jet reduced by a needle valve. At the same time the area of the passage-way for the mixture into the inlet pipe is reduced. Two systems of high ignition are provided—magneto and synchronised coil and accumulator—one lever controlling both. Lubrication is effected by means of a tank fixed to the side of the chassis, kept under pressure by means of the exhaust, and

Fig. 93.—Chassis of Germain Six-Cylinder Car.

(Fig. 92) is mounted on the forward end of the universal joint shaft, which makes connection with the cardan shaft. The auxiliary shaft is actuated simultaneously with the main clutch, and by the same pedal, so that when changing gear the gear-box is instantaneously disconnected from the transmission both fore and aft and the operation of changing gear considerably facilitated, enabling it to be effected without noise and without any danger of damaging the gears. The final drive is by a cardan shaft to a live axle. The road wheels are carried on the sleeve or casing surrounding the axle, the outer ends of which are extended and turned over to form, as it were, the hub caps, which are bolted to the wheels. By removing these bolts the cap and the half axle can be

a sight feed rack on the dash conveys the oil to each pair of cylinders, the crank case, and the bearings in the gear-box. The ignition and throttle levers work on a sector above the steering wheel, which does not rotate with the latter. A universal joint is provided between the clutch and the gear-box. The latter is provided with ball bearings. Three speeds and a reverse are controlled by a single lever, working in a "gate" quadrant, provided with a lock on each speed. The transmission from the gear-box is by a cardan shaft and bevel gear to a well-supported live axle, and designed to receive any one of eight different sizes of bevel pinions. The frame is supported on five long springs, the shackles of which are fitted with lubricators.

F. and S. Ball Bearings.

On the stand of the TORMO MANUFACTURING COMPANY (Messrs. H. and D. FRIEDENHAIN), 67 and 68, Bunhill Row, E.C., will be found the F. and S. ball bearings which have been fitted on the cars that have been most prominent in the racing season of 1907, notably in the Kaiser prize, the Herkomer Trophy, the Grand Prix, the Targa Florio and the Graphic Trophy—the latter following the Tourist Trophy competition in the Isle of Man. These bearings are claimed to have exceptional wearing qualities as well as to give ease of running—points which have received ample demonstration both on racing and touring automobiles. The cages for the larger sizes consist of two perforated brass plates which are kept apart by rivets and screws, while those of the smaller type are solid. In the latter the balls are held in tapered holes.

Smith's Speedometers.

Many exhibits that add to the convenience as well as the luxury of the car will be found on the stand occupied by Messrs. S. SMITH AND SON, of 9, Strand, London, W.C. Motor watches and clocks, communicators, lamps, horns, voltmeter and electric fittings generally, will be found here, including the Alpha lamps for which the firm are special agents. A new registered design of hand mirror is also on view, as well as the latest designs in rubber goggles. But the main interest in the exhibition of Messrs. Smith and Son naturally centres in speed indicators and other instruments entailing accuracy in their most minute adjustment. These have frequently demonstrated their value and have saved purchasers many pounds when used as evidence in police court cases. Among the innovations likely to interest visitors to the Show is a new speed indicator (Fig. 94) suitable for use on small cars

Fig. 94.—Smith's New Indicator.

and made at an extremely moderate price. A speed up to thirty-five miles per hour is registered with the unflinching accuracy that character-

ises the larger instruments. The "Popular" is another indicator for cars of ordinary power. It registers up to fifty miles per hour and is fitted with the total mileage recorder. Messrs. Smith and Son do not intend to fit these instruments with the maximum speed hand or trip recorder, this adjunct being reserved exclusively for the "Perfect" speed indicators of the firm. Another new type is a speed indicator with a more than usually plain mileage recorder. In this instrument the trip recorder is shown round the dial up to 100 miles, which can be set back to zero by pressing a knob at the top of case. The total mileage recorder is shown in the centre of the dial. This is a *modèle de luxe*, and likely to be popular on the big cars. Milometers, motor watches, and general motor accessories, are also shown on this stand. A new speed indicator has been produced in response to the demand for an instrument that will record up to 10,000 in clear and plain figures, while the trip recorder is arranged round the dial, the hand pointing to the number of miles traversed. By pressing the knob at the top of the dial the hand is returned to zero ready to start another journey, a convenience to motorists wishing to take accurate records of given distances.

Aster Specialities.

At the stand of the ASTER ENGINEERING COMPANY, LTD., is a full range of the 1908 Aster engines as well as a selection of gears, pumps, radiators and other motor-car components. The 14-16-h.p. Aster engine is shown with the four cylinders all cast in one piece. The bore and stroke is 84 mm. and 110 mm. respectively. Those interested in engines for commercial vehicles where vibration and possible hard usage have to be considered will notice the two-cylinder 20-h.p. Aster engine with bore and stroke of 130 and 140 mm. respectively. The new Aster carburettor is attracting much notice at the stand. By means of a patent air

Fig. 95.—The "Popular" Indicator.

inlet valve a predetermined mixture is obtained from the carburettor for any position of throttle or any speed of the engine. This feature is a device by which the suction at the petrol jet or depression in the mixing chamber is varied in such a way that the spray of fuel induced is always of a quantity that when mixed with the air entering the cylinder it gives a mixture of such proportions that a great combination of power and economy is obtained. It is mechanically operated, and contains no elements liable to get out of order. This air inlet valve and mixing chamber is comprised of two members having coincident ports, the ports in one member being arranged to cut off on the ports in the other member. The ports are of special rectangular formation, and the movements of cut-off of the two members are arranged to be parallel to adjacent sides of the rectangular ports. One of the members is directly connected with and moved in proportion to the movement of the throttle valve of the carburettor. The other member is either fixed or moved in direct accordance with the speed of the engine; the members constituting the inlet valve cut off one or the other in direct proportion to the displacement of the moved member. The working in association of the two members of the valve enables a predetermined depression in the mixing chamber to be obtained for any combination of positions of the two members in their respective travels. The new carburettor is made under Hamilton's patent, and is being made in two sizes to suit engines of powers varying from 12 to 40-h.p. Economy of petrol as well as efficiency and simplicity are well combined.

Bowden Devices and Miraculum.

A quintette of novelties give new interest to the exhibits of the E. M. BOWDEN'S PATENTS SYNDICATE, LTD., viz., the Bowden automatic hand regulated auxiliary air inlet, the firm's improved exhaust cut out, the Bowden new carburettor agitator, the new petrol strainer, and the Bowdenloc levers, these being special self-locking devices for use with the Bowden wire mechanism. In addition to a full range of the Bowden specialities special interest is being taken in the "Miraculum" staged on the stand. The syndicate is the selling agent for this preparation, they having the necessary charging depot at 29, Baldwin's Gardens, Holborn, London, E.C. Miraculum is an automatic puncture sealing compound the ingredients of which are akin to the constituents of rubber in its native state. Air tubes charged with the preparation are immune from ordinary puncture troubles. It is claimed that Miraculum acts as a preservative of the rubber, and from the testimony of actual users it is evident that it will be much to the front in the coming season.

The Hutchinson Tyre.

A selection of motor tyres and the accessories associated therewith makes up an effective display by ETABLISSEMENT HUTCHINSON, of 13, Maddox Street, W. The specialities of the concern are tyres moulded and built up, being specially reinforced at the head, and a steel-studded non-skid pattern with specially hardened rubber head. Sections of all sizes of tyres are shown in various processes of manufacture. The Hutchinson tyre is a beaded edge type, the tread being of rubber of a high quality. In fact, the rubber tread is of such a kind that in a Continental tour of 2,000 miles a well-known motorist had no single puncture with the Hutchinson tyre, and beyond a few surface cuts his tyres were as good at the finish as at the beginning. The Hutchinson wood-fibre steel-studded non-skid also deserves mention. The steel studs of this non-skid are held by specially hardened compressed wood-fibre plaques which protect the running surface and obviate all wear of the rubber tread.

Salsbury Lamps.

The motorist searching an Exhibition for the latest designs in lamps naturally hies himself to the stand of Messrs. SALSURY AND SON, LTD., whose showrooms at 124, Long Acre, W.C., have become familiar to our readers. Their British goods are also shown in the Gallery, where the new patterns for 1908 are attracting much notice. These include the "Anti-Dazlo" lens, a new self-contained head light, the unit system of generator, a new "Volute" and a new "Solophone" horn. The first-named speciality is a new lens, in which, by providing suitable surfaces within the lens of the lamp, the rays of light which would otherwise be projected upwards and produce an unpleasant "glaring" effect are reflected downwards, the beam being restricted to a level below that of the line of vision of the observer. This result being obtained from the construction of the lens itself does away with the possibility of the rattling of fittings introduced to secure a similar result. The lens is of the convex form in horizontal sections put together with fluorine acid. The firm's unit system of generator is a capital introduction. The horizontal generator has a lever-lock door and is of extremely simple construction. It can be screwed to a platform or carried on a tray. These unit generators can also be used in series. Attention may also be drawn to the "Solophone" cut-out, which is operated by a pedal and emits a melodious sound for clearing the way.

Motor Parts and Tyre Patches.

In the gallery Mr. W. H. M. BURGESS, of 40, Glasshouse Street, Piccadilly, W., will be found advising those interested in the merits of the White and Poppe engines and carburettors and urging the undoubted merits of the "Anti-Panne" blow out patches. The latter are designed to assist motorists on the occasion of tyre troubles. They are made in various forms to meet different contingencies, the latest introduction being a patch without the familiar foot and suitable for bursts on the tread as distinct from head bursts. These are made

for 65, 90, and 120 mm. tyres, with intermediate sizes, and are one of the handiest forms of patches to be seen in the Show. Other "Anti-Panne" specialities include an aluminium solder and repairers' tools. Mr. Burgess is also showing the A.P.B. motor components, including back axle, gear boxes, steering columns and front axles, all of which are guaranteed for an adequate period. The back axles are of the 15-h.p. and 24-30-h.p. type, and are complete with hubs, brakes, and torque rod. The large size of gear-box has four speeds and reverse, the other three speeds and reverse, both patterns having ball-bearings throughout. These are characterised by good finish, and will be appreciated by those desirous of promoting the prosperity of British manufacturers.

Jones' Speed Indicators, &c.

While not stocking every accessory required, or likely to be required, by the motorist, Messrs. MARKT AND CO. have specialised on several necessary adjuncts for the car, and in these lines handle some of the best known goods. They have been responsible for the placing upon the market of the Jones' speed indicators, speedometers, and other similar instruments of precision which have become so well known as to be used in evidence in police-courts for the purpose of rebutting prosecution and avoiding persecution. In addition, they have placed on the market the "Little Wonder" vulcaniser, the "Eureka" triplex pump, the Marion "Baby" auto-torch, and other specialities, several of which have been illustrated and described in our pages from time to time. Foot bells and a full range of French horns of a high grade also find a place on this stand. Some of these articles have been illustrated in our columns of late. The merits of the Jones' speedometer, however, deserve more than passing mention, and we would direct special attention to the Jones' Combination speedometer-odometer. These are designed for fixing to the dashboard and are actuated by means of a flexible shaft and gear attachment on the wheel of the car. The driving gear consists of a large gear attached to the hub of the wheel and a small gear carried by a ball-bearing shaft at the end of the flexible cable, and supported on the steering knuckle by means of an attaching bracket. The speedometer-odometers shown on the stand indicate variable and maximum speed and register the distance travelled. The season mileage to 9999 and the day or "trip" mileage to 99 is cumulatively recorded, whether the car goes forward or backward; the trip register can also be instantly reset to zero by pushing the button. A copper maximum speed hand contrasts with a black variable hand. It is carried forward by the latter, but stops automatically at the highest speed attained, showing that speed as a permanent record until released by a push of the resetting stem at the bottom of the cup. When released, the maximum hand instantly returns to the speed at which the car is at that moment travelling, and there again remains, even after the car is subsequently stopped; thus giving absolutely indisputable evidence of the speed of the car at the moment of resetting. By pushing and giving the resetting stem a half turn, the two hands are made to work as one, indicating variable speed only. Permanent accuracy of operation is one of the claims rightly put forward on behalf of these instruments.

Moseley's Tyres.

The literature issued by Messrs. DAVID MOSELEY AND SONS, LTD., is of distinct value to motorists, and the pamphlet in answer to the question "What size of tyre should I use?" should be studied by all owners of cars as well as by those responsible for their good running order, in which the tyre plays an important part. For the 1908 season the firm's "Detachable" tyres are being made a special feature. This can be removed and a new tube fitted in the minimum of time. The rim consists of a hollow metal hoop concaved at each side for the rings of the flanges. The latter have been rendered removable by a turn-buckle screw worked by a Tommy bar, which is now superseded, in the new pattern, by the ratchet with the necessary operating tool, which enables the bead to be extended for removal in the shortest possible time. In order to give a better chance for the life of the tyre a new canvas is inserted in the rubber, and when the tread wears down to this the user is warned as to the desirability of repair, on the principle of "a stitch in time saving nine"—or more. Messrs. Moseley and Sons, Ltd., have been able to fit beaded covers to the rims, and the idea has found much favour since its introduction. The firm's detachable metal studded non-skids are also on exhibition as well as a good style of automatic tyre gauge, gaiters, &c. Reference to this stand would not be complete without mention of their tyre cases with satchel fastened within the circle. This economises space, and we like the improved form of clip for the case, which does away with the lacing and unlacing so irritating when on tour. Altogether Messrs. Moseley and Son are to be congratulated on the excellence of the display. They also draw the attention of visitors to the Show to the retreading and repairing departments of their extensive motor tyre works.

The Denton Carburettor.

A conspicuous novelty on the stand of Messrs. G. DAVENPORT AND CO. is the Denton carburettor of Messrs. Tanner and Deane. Dispensing altogether with a float chamber, the device claims notice on that account, while its efficient working with petrol or paraffin gives it another point of interest. The Denton carburettor has a central cylinder ending in a domed top and containing a coil into which the paraffin or petrol enters. Hot water or the warm exhaust passing through the cylinder heats the fuel, which is fed from the coil into an annular space between the cylinder already mentioned and

another. The latter is made of a porous earthenware, through which the fuel naturally percolates in a divided state to be drawn by the air into the inlet pipe of the motor, and so thoroughly carburetted. Having thus described the primary features of the device, it remains to be explained that a mercury barometer is connected with the bottom of the space between the two cylinders. The top of this is connected with the induction pipe by means of a vacuum tube just below the throttle. Then when the engine commences to work a partial vacuum is created which causes the mercury to fall and uncover some of the porous cylinder, according to the speed of the motor. In this way correct mixture at any speed is obtained automatically, while the simplicity of the parts and the economy of operation are merits that should appeal to those on the look-out for new inventions calculated to suggest advances on old methods.

Lubricants.

Messrs. PRICE'S PATENT CANDLE COMPANY LTD. have their stand in the same position as last year. The past season has been very successful, their oil having been used on all the winning cars in the Isle of Man Trials, and on the majority of the most notable cars in the Scottish Reliability Trials. As a fitting conclusion, one of their oils has been selected as particularly suitable for the Arrol-Johnston cars, which, under Lieut. Shackleton's command, will be driven, if possible, to the South Pole. At Olympia are exhibited their standard lubricants, a specimen of the famous non-congealing oil prepared for the South Pole expedition, and samples of several new oils of particular interest to motorists in general.

E.I.C. Specialities.

The ELECTRIC IGNITION COMPANY, LTD., have issued a capital wiring map, which they will be pleased to send to those applying to their works at Sampson Road North, Birmingham. These are also being mounted on rollers similar to ordinary maps at a small charge. Their exhibits include their well-known E.I.C. specialities, including the high-tension magneto, high-tension distributor, Simplex coils, accumulators, switches, charging sets, &c., and the E.I.C. generative sets. The latter enable generators to be charged while the car is running on the road and provide sufficient electric current for the complete lighting of the car as well as ignition, accessories, &c. It is deserving

Fig. 96.—E.I.C. Plug. Fig. 97.—E.I.C. Switch. Fig. 98.—Contact Breaker.

of note that all these specialities are guaranteed for two years. In Fig. 96 we illustrate the company's midget plug on the Gordon Bennett model and specially designed for motor-cycles. It has the same good features as those for cars, there being no lock nuts, packing, or leakage. Neat in appearance, that for cycles is rather shorter than the larger car size plugs outside the cylinder, merely as a matter of convenience. The E.I.C. "Simplex" coils for 1908 have all the terminals at the bottom of the coil. The connections are made when the coil is first put on the car and properly soldered and taped up, thus making thorough electrical connections. Consideration of space prevents consideration of all the specialities shown on the present occasion, but the illustrations, Fig. 97 and Fig. 98, serve to draw attention to the E.I.C. contact breaker and the E.I.C. switch respectively. In the case of the former all the parts exposed to wear are of hardened steel. The platinum points rub slightly together as they make contact, and a big, quicker and consistent spark occurs at the correct time. The switch is made in three types, being an ordinary single way for one battery or magneto only, ordinary two way for two batteries, and a double ignition switch for changing over from any type of magneto to high-tension coil and accumulator ignition.

The Orme-Whitlock Radiator.

A variety of metal work is to be seen on the stand of Messrs. ORME, EVANS AND CO., LTD., of the Phoenix Works, Wolverhampton. Bonnets, petrol tanks, mudguards, metal seats, and dashboards make up a well-arranged stand, on which the firm's radiators also have a place. These include both the ordinary gilled tubular type and the Orme-Whitlock radiator, which has made a distinct place for itself in the motor industry. The sizes shown are for cars ranging from 16-h.p. to 40-h.p., the method of construction securing high efficiency as well as a good appearance—two features which, well combined, are essential with such a part of the car. Briefly described, the Orme-Whitlock radiator consists of a series of transversely corrugated tubes extending between an upper and lower water tank. The corrugations of each tube are reversed with relation to the two tubes adjacent on either side

thus forming air cells running from front to back. In the size for a 20-h.p. car there are about 60,000 minute radiating points. The cellular portion is in copper, and the water tanks and case are of polished brass. No additional water tank is necessary where the Orme-Whitlock radiator is used, the two or three gallons held by the radiator and jackets being sufficient to ensure adequate cooling. With regard to weight, we may mention that this radiator has two square feet of water space per pound of gross weight. A good line of footwarmers is also on this stand.

Varnishes.

Messrs. A. F. HARDING AND CO., LTD., have come to the front among motorists with their morocco leather revivers. These are shown at the present Exhibition in all colours, and visitors will be able to see for themselves how efficacious these have proved in restoring the appearance of the inside linings of automobiles. A varnish reviver for renovating the bodies of vehicles and a preparation for removing dirt and grease are also shown. Other exhibits include the firm's "Blackall" for touching up the black iron and woodwork of cars and the "Osoey" metal polish. This latter is a liquid preparation for brightening the nickel and silver plated parts of motor-cars of all degrees.

New Specialities for 1908.

One of the most interesting displays in the gallery is that of Mr. E. J. HARDY, of Bishop Street, Coventry, whose agencies for the best known accessories give value to his stand. Here will be seen the "Godiva" plug, of which no fewer than thirty-six were used in the Tourist Trophy race of the present year. The construction is remarkably simple. The centre pin, to which is screwed a nickel point, is wrapped with mica and then inserted in a porcelain tube. This is then protected by a second and outside covering of mica. The value of this plan is that the porcelain is doubly protected by mica—inside from the internal heat and outside from any rough usage. Hence the Godiva plug presents a device in which the porcelain is not likely to be cracked. Mr. Hardy is also representing the "Warrior" plug. This has done good service for the Daimler Company. It is 3½ in. in length, the length of base from the engine thread to the sparking points being 1 in.—a length recommended by the makers as securing a deep projection

into the cylinder, although it can be shortened if greatly desired. Other specialities on this stand include the J G² trembler, introduced by M. Guenet for the 1908 season as one that cannot readily be mis-regulated. For six-cylinder ignition a Guenet coil consisting of three units with

Fig. 99.—The Heron Pump.

two high tension terminals on each unit has been introduced. With this system two cylinders spark at once, but an advantage is obtained in the coil being reduced to half the size which would be necessary if six units were employed. New models of the Longuemare carburettor are on view, the improvement in which will be referred to in an early issue of the *M.C.J.* The Alpha headlights, the Frankonia lamps, and the Dependence electric headlamps are also exhibited on this stand. Another exhibit is the Heron motor pump for automatically inflating tyres by the power of the engine. This is illustrated in Fig. 99, which shows the general arrangement of the device. The pump is bolted to the frame of the vehicle and is worked by a cardan propeller shaft connected with a friction wheel held in contact with the engine fly-wheel. A worm driven wheel mounted in the pump casing, with ball thrust bearings, reduces the speed, and the cardan shaft can be made in any length according to the make of the car. The installation is completed with a Southall tyre tester. The Heron pump works up to 160 lbs. pressure, and oil is prevented from passing into the tyres by a very ingenious packing.

"Sternoline."

The range of automobile specialities introduced by the STERN SONNEFORN OIL CO., LTD., is growing in extent and utility, and now embraces oils and lubricants for practically every requirement of the motorist. The intention of those responsible for these preparations has been to specialise in connection with each particular service required and thus secure the best results. Thus, for the lubrication of chains the Sternoline chain sticks are required; for axles, gear cases, &c., Fram lubricant is recommended; for use on metal or leather clutches Clutcholine is suggested as a pure non-corrosive lubricant specially made for this service. Coolorid is a new preparation for cooling the hottest bearings, brakes and clutches of cars, while the Elastic Sternoline chain paste has a hard yet elastic surface, and acts as a lubricant while reducing noise. Other specialities of the STERN SONNEFORN OIL CO. include those for air and water-cooled cylinders and for superheated steam cylinders.

Fire Extinguisher.

On the stand of the VALOR COMPANY, LTD., of Rocky Lane, Aston Cross, Birmingham, is the "New Era" petrol fire extinguisher, that is becoming familiar on the motor-buses and cabs now in public service. On several occasions we have referred to the good points of this device, which minimises the risk of fire, and provides a reliable means of extinguishing the same should an outbreak occur. It may really be looked upon as a sure way of reducing insurance premiums, the leading com-

panies having agreed to rebates where the "New Era" appliances are adopted. The cylinder, which contains chemical ingredients that will not deteriorate, owing to the system of hermetically sealing, is of prepared sheet steel and tested to a cold-water pressure of 350 lb. to the square inch. It will throw a stream of fire-extinguishing chemicals from forty to fifty feet, doing its work instantaneously upon petrol, alcohol and other inflammable liquids and materials that are not acted upon by water. For the use of private motorists the extinguisher is now made in a case fastened by a spring bolt operated by a button. When the lid is raised the front falls downward so that the handle can be taken and the appliance easily pulled out for service. The case can be fitted anywhere on the car, a good position being on the step, where it adds, rather than anything else, to the appearance of the vehicle, while increasing the confidence of the passengers in the event of trouble arising.

The "Thomas" Tyre.

On the stand of the Avon India Rubber Company, Ltd., the THOMAS RESILIENT TYRE, LTD., of Bute Chambers, Cardiff, have brought their speciality before the public. More than that, they have been able to give practical evidence of the merits of their invention by means of a car running in the vicinity of Olympia, and proving that while they have combated the tyre evil they have not sacrificed the resiliency of the tyre. The "Thomas" resilient tyre is a solid rubber tyre, provided with a series of grooves crossing each other in such a manner that the base is divided into a series of isolated projections. These act as "buffers," and the grooves afford space for the displacement of the rubber when under pressure. A good degree of resiliency is thus attainable, and the action of the tyre is comfortable to the rider in the car. The tyre is extremely resilient, and its durability is assured. The transverse grooves absorb elongation, and the buffers, acting freely under pressure, do not wear to any material extent. The "Thomas" tyres can be easily and quickly fixed or removed, and it is unnecessary to send the wheels to a tyre-fitter for renewals. Another point is the working face, or tread, of the tyre has wide transverse grooves of greater depth than is usual in pneumatic tyres, thus providing increased protection against skidding.

The "Millaro" Wind Screen.

On the stand of Mr. A. C. PENMAN, the well-known motor-carriage builder, of Dumfries, will be found the "Millaro" rain and wind screen which he is placing on the market in conjunction with the Glasgow Motor Tyre Company, of 71, Waterloo Street, Glasgow. In this device there are two projecting sheets of glass, the top one of which sends the wind up, the lower one projecting it down, so that there is a calm centre of 4 inches from which the driver can look out without the vision being interfered with by misty glass—one of the great objections urged against some other makes of screens. The great point which the purchaser has to consider is to give the correct level of the driver's eye from the top or bottom of the screen frame, so that the parts may be adjusted to secure the desirable object aimed at.

"Rich and George" Detachable Flange.

Among the detachable flanges exhibited for the first time attention may usefully be drawn to the device invented by Messrs. H. C. Rich and George and introduced to visitors by Messrs. LEWIS, BEVAN, AND CO. The fact that by the adoption of this speciality new tubes can be replaced in two minutes, and a tyre changed in less than six minutes, commends the flange to those who have had experience of dreary roadside halts. In order to operate in the event of tyre trouble the car is jacked up—the "Early Riser" jack, brought out by the same inventors, providing a good means of performing that operation—and the flange removed. The new tyre having been fitted, the flange is again placed in position, being secured by a series of catches worked by springs which cannot possibly work off. Thus security is assured. Existing rims can be adapted to this innovation, which should rapidly become popular.

The "Grose" Band.

The "Grose" was one of the earliest types of non-skid bands placed before motorists, and, despite the advent of many rivals, maintains a good position. The inventor has been quick to perceive where improvements could be effected, with the result that the "Grose" band, made by Messrs. GROSE, LTD., of Northampton, has kept pace with the advance of the car itself. The tread is made of chrome leather fitted with a steel-studded strip, effectually preventing the sliding action that takes place on greasy roads. A special process of preparation secures the leather being formed into the exact curve of the tyre for which it is intended, thus giving a very neat appearance when fitted. To meet the wishes of those motorists who prefer a detachable band, one of that type has been introduced. This is an admirable substitute for rubber re-treading, and should be economical in service, as the studded leather portion can be renewed when worn. As an instance of the care bestowed in the manufacture of this band, we notice that the clips are nickelled to prevent the rust that proves so destructive to such devices. Messrs. Grose, Ltd., have lately introduced Rubberised Leather into their bands, this being specially prepared to secure the toughness and durability of the leather combined with the flexibility of the rubber. This non-skid is affixed in the ordinary way, and should prove as popular as the others with which the name of Grose is associated.

Accessories and Clothing.

Messrs. ALFRED DUNHILL, LTD., have a comprehensive show of accessories and clothing for the 1908 season. In the former section of their display is included the "Auto Friend" device for locking the

change-speed lever in the neutral position. This was described and illustrated in a recent issue. Among the novelties of minor degree is a petrol filler which is in the form of a funnel fitted with a length of flexible tubing for insertion in the petrol tank. Inside the funnel is a gauze screen, while it is fitted with two brass collars of different sizes so that it will fit any make of can. Horns and sirens constitute a growing department more varied than ever and with such a range of novelties that the task of selection is becoming increasingly perplexing. Recognising this, Messrs. Dunhill are rightly giving preference only to those articles of high grade efficiency. The "Powerful" combined buzzer and bulb horn gives a note of a particularly penetrating character, and the "Python" has also distinctive merits. Fire preventives, shock absorbers, road maps, the "Anti-metallic silk" goggle, and fibre luggage-boxes to fit odd corners of the car and covered with waterproof cloth to match the colour of the vehicle, are also included in the exhibits. Recently we draw attention to the stylish character of the clothing designed by the firm, and illustrated some typical examples of their gentlemen's raiment. These are all shown at Olympia, several smart patterns of Irish frieze being very prominent on the stand. The semi-motoring attire combines some good features in clothing for those whose motor travel is mainly in town. At this stand, too, will be found a selection of clothing for fair motorists, in which the protection from the weather given by leather is combined with cloth or fur of fashionable appearance. Motor millinery is another important department of Messrs. Dunhill's exhibit.

Exonite Specialities.

At several previous motor exhibitions Messrs. DOVER, LTD., have drawn attention to their steering wheel fitted with their patent "Exonite" covering. This is now being produced with a remarkably smart appearance that has the advantage of permanence. It is impervious to oil or water and with the under part ribbed constitutes one of the best steering wheels now before motorists. Specimens of motor castings in aluminium, and motor levers, lever knobs, handles, &c., in exonite are also on view, as well as transparent sheets for the windows and hoods of motor-cars. These sheets have become increasingly popular with the advance of the wind shield, and entirely obviate the risks that are run where glass only is employed in the construction of such necessary adjuncts to the comfort of cars.

Motor Elevators.

Messrs. H. ADAMS AND COMPANY are again present in the gallery with their specialities in motor jacks and motor elevators. The former have become almost indispensable for the purpose of easily lifting and moving automobiles in confined places such as are often met with where motor-cars are stored. The elevator, which, since its introduction at Cordingley's Motor Show at the Agricultural Hall, has come largely to the front, entirely dispenses with the motor pit and facilitates the adjustment, cleaning and painting of cars as well as the work of repairing the same.

Electrical Accessories.

The various electrical accessories for the automobile introduced by Messrs. C. A. VANDERVELL AND COMPANY are well known, but the many new devices shown on the firm's stand at Olympia will lend special interest to their display. Several types of the new pattern C.A.V. magneto are on view. In accumulators about 150 models are shown, and in this connection we may mention that an entirely new form of terminal is being introduced by the firm, the main feature of which is to do away with the possibility of the terminals corroding or getting absolutely fixed by means of the action of the acid, should any escape from the accumulator. This is achieved by simply drilling the lug down a distance of about $\frac{1}{4}$ in., and forming a thread in the same. Into this is screwed an ebonite plug with a milled cap. Through this plug a small hole is drilled and the wire strands of the cable passed down. The latter are then spread out so that when the plug is screwed down into the lug it forms a perfect connection, but one that at all times allows of an easy and instantaneous release. A neat and easily detachable wiring terminal is also shown. In this no solder is used. The wire is fixed by a set screw into the tubular terminal, which has a loop with a spring centre-piece to grip the thread of the plug. Other accessories include the C.A.V. electric light adapter, a new pattern of induction coil for next season's Daimler cars, a two-way switch, electric lamps, and a new roof lamp for Cape car hoods. Messrs. Vandervell and Company also exhibit the electric vulcaniser, recently described in these columns, and the dashboard fitting illustrated in our issue of the 19th ult.

The "Beresford" Rim.

At a recent Stanley Show there was exhibited for the first time the Beresford patent motor rim, which had points of considerable merit. Since then improvements have been effected, and these are now being exhibited at Olympia by the BERESFORD RIM COMPANY, LTD., of Newcastle, Staffs. The construction is somewhat similar to that of the ordinary rim, with the exception that while one side is riveted to the base, the other is detachable. The latter flange is cut across diagonally. It has also a foot or anchor piece threading into the turned over edge on the base of the rim. When the detachable flange is removed, the circumference of the base of the rim is almost the same as that of the tyre, allowing a very easy removal. The locking principle of the rim is automatic, the inflation stress being equally distributed throughout the circumference of the rim. There are no bolts, nuts or clamps

to worry about, and in the form in which it is now being placed before motorists no injury can occur to any part of the tyre. It is adaptable with any make of tyre, and the Beresford rim can be fitted to existing wheels without much trouble. It is shrunk on the fellos in the same way as any ordinary rim would be, and the only alteration necessary to fit it to existing wheels is the reduction of the fellos slightly more than one-eighth inch.

Accessories and Pumps.

The exhibit of Messrs. ROSS, COURTNEY AND COMPANY, LTD., is of extremely varied interest, their display including hand and foot pumps of various patterns, petrol taps, valves, levers and other component parts. The Ross Courtney patent terminal, which obviates the use of pliers or tools, is a simple and effective device making a certain contact without losing the flexibility of the cable. A large number of screws, terminals, nuts, &c., are shown, and special attention is drawn to the firm's new pump for use in the garage or workshop, or, in fact, anywhere where a high pressure of air is required. This can either be fixed in one place and attached to the tyre valve by means of a long length of rubber, or it can be fixed on a moveable trolley for shifting about in the garage. It can also be used to keep the reservoir filled with air under pressure from which the tyre can be inflated. The base plate of the pump is 14 in. by 19 in., the extreme height being 2 ft. and the diameter of the wheels being 16 in. Various other accessories are shown by Messrs. Ross, Courtney and Company, among which may be mentioned their patent petrol pourer, by means of which the free and rapid filling of a tank can be secured without the petrol bubbling around the tank pourer or the funnel. The pourer has also a filter and will assist garage owners in keeping their establishments clean and in order.

The "Ross" Head Lamp.

Many have been the attempts made to meet the objections of the public to the glare associated with the ordinary form of motor headlights that constitute a nuisance when passing through towns where traffic is congested. A complication of working parts and an

Fig. 100.—The Ross Lamp.

absence of the exact control that alone makes for perfection in such devices has led to many types falling into obscurity. Now, however, there are to be seen at the Show some good designs which will be of interest. Among these we have been struck with the simple construction and efficient points of the "Ross" head lamp which Messrs. J. T. WILLIAMS AND CO., of Birmingham, have placed upon the market, and the merits of which are being demonstrated on the stand of the U.M.I.—a stand which constitutes an exhibition of accessories in itself. The intention of the inventor has been to throw a powerful beam of light well ahead of the car for country driving, while the requirements of urban authorities are also recognised and secured. The reflector in the "Ross" lamp is hinged at the top and operated by a handle which is fixed on the dashboard. The handle is connected to the lamp by means of a Bowden wire (see Fig. 100), and, pulled from the seat, ensures that the beam of light is either thrown well ahead of the car or shut off close round it as desired. There are no complications in the mechanism and the device is thoroughly under the control of the driver. The lamp is supplied with gas from the "Ross" patent acetylene gas generator, which gives an absolutely uniform volume of gas per hour to the burners without attention, and, further, is unaffected by the vibration of the car.

Wheels, &c.

The "Rapeasy" tyre lever, which was introduced to motorists at Cordingley's Show in the spring of the present year, will be found on the stand of Messrs. SMITH, PARFREY AND COMPANY, LTD., who also have a large collection of artillery wheels for cars, axles, steering wheels, forgings, gears, &c. Prominent in the exhibit are the firm's bent timber specialities, including Cape cart hood, sticks and other accessories for that important branch of the automobile industry.

Aluminium Solder.

Messrs. J. E. HUTTON, LTD., in addition to showing cars on the main floor have a stand in the Gallery, whereon is the reliable O.S. speedometer and some miscellaneous exhibits. These include an aluminium solder and flux which can be used with equal success on pure sheet aluminium or on the alloys used in making castings. It has advantage in the fact that it will not oxidise. Hutton's Mercedes oil for the engine lubrication of Mercedes cars has been specially prepared for the purpose and is here shown. The exhibits also include a large collection of spare parts for these and the Berlet cars. Repairs are undertaken by Messrs. J. E. Hutton.

The Dunlop Rim.

So recently was the Dunlop detachable rim illustrated and described in the M.C.J. that our readers are familiar with the main features of this ingenious device for easing the labour of removing or fixing tyres. A solution of the skidding problem is suggested in the use of the Dunlop

steel studded tyres fixed upon the company's detachable rims. The tyre is mounted on a steel rim, fully inflated, slipped laterally on to the motor-car wheel. Then by a single movement of the locking lever the steel flanges mounted on the wooden felloe of the wheel expand and hold the rim and tyre securely in position. So simple is the arrangement that a rim and tyre has been taken off and put on seven times in sixty seconds. The fact that this is all done without the use of screws, nuts or bolts, is, of course, the secret of success. Other accessories on the stand of the Dunlop Pneumatic Tyre Co., Ltd., include a patent tyre manipulator for the easy removal and insertion of valves and security bolts, the steel-studded tyres, the grooved non-slipping tyres and the well-known Dunlop tyres.

Coils and Accumulators.

Those in doubt as to the electrical problems associated with the motor-car will do well to examine the exhibits at the stand of the HIGH TENSION MOTOR COMPANY, of Addington Square, Camberwell, S.E. These include both high and low magnetos, the former with separate transformers; coils, switches, accumulators, &c., as well as the repair parts of coils and magnetos. The H.T. coils are very economical in current consumption. Owing to the unusually slight wear at the platinum and the springiness of the blade, which follows up all wear, the platinum hardly ever requires adjusting. Great speed is achieved by doing away with the heavy secondary trembler often found on coils, and substituting at the end of the single blade a small loose rivet which follows every vibration of the trembler instantaneously. An intensely rapid hot flame spark is given which will ignite the weakest mixture.

Rotax Specialities.

In the Gallery, the ROTAX MOTOR AND CYCLE COMPANY, of 43 and 45, Great Eastern Street, London, E.C., are attracting many exhibitors to their interesting display of specialities in horns, lamps, coils, jacks, car lighting sets, ladies' and gentlemen's companions for car service and the like. A special feature is made of "indicators" for the driver, in ivory, while the presence of Larrad's timing device on this stand is of interest. In Fig. 101 we illustrate the Rotax sparking plug, which has merits of reliability beyond the ordinary. The centre rod is very large and is composed entirely of pure nickel. The spark passing from nickel to nickel can neither carbonise nor fuse the points. The shape of the cap and its exposure to a current of air insures a constant automatic cleaning action at the point where the spark takes place. The central rod being in one piece allows of a ready and exact adjustment by means of the flattened end of the terminal. The large volume of space enclosed by the lower part of the plug and insulating screen makes it impossible for this plug to be fouled by grease or soot. A large display of acetylene head lamps of sound construction is also made by the company, while their range of electric lamps is also notable. Several good types of horns are also on view, including the loud and deep toned "Scarem." Among the miscellaneous exhibits on the stand are canteens and companions for tourists in great variety and the Rotax square mirror.

Fig. 101.—The Rotax Plug.

Messrs. W. F. FLATHER, LTD., exhibit specimens of their "Ubas" case-hardened steel for gears and other parts of motor-cars. They also show nickel steel of all tempers, chrome steel, Vanadium chrome steel and other steels which have gone largely into use by the automobile industry during recent years. The firm's standard high speed steel and files are also on view.

In addition to having a splendid example of their work on the Hotchkiss car, to be seen on the stand of the London and Parisian Company in the main hall, the EXORS. OF F. A. HAMSHAW, 37, Humberstone Gate, Leicester, make a good display in the Annexe, where their exhibit consists of a limousine on a 30-h.p. Siddeley chassis, a single landaulet on a 20-30-h.p. Hotchkiss, and 15-h.p. Mors with limousine body, the latter being specially designed for town use.

Messrs. BENTON AND STONE, of Bracebridge Street, Birmingham, show the "Enots" specialities, which include a patent dashboard lubricator, applied to either exhaust or forced-feed mechanical lubrication. This is adapted for any number of drips, and, in addition, an electric glow lamp is provided to illuminate the drips at the will of the driver. The glasses are removable for cleaning. Sparking plugs, petrol filters, pressure pumps, tyre testers also find a place in this exhibit.

Several useful novelties are found on the stand of the GRATZ PATENTS AND ENGINEERING SYNDICATE, LTD. The many instruments which have gained the company a good place among makers of accessories, &c., are also on view, these including the Gratz speed indicator, the firm's improved Plante accumulator and electric lighting sets, with many varieties of electric lamps for interior and exterior motor-car lighting.

Messrs. PEARSON, who make accumulators, &c., for the trade, show several types of their speciality for cars of various sizes such as they have supplied to many of the leading makers. These are characterised by sound construction and workmanship.

Shrewsbury and Challiner Rims.

As usual, a good exhibition of tyres is being made by the Shrewsbury and Challiner Tyre Co., Ltd., of Kay Street, Ardwick Green, Manchester, who make a special point of their patent detachable rim in which efficiency is secured without any complications whatsoever. This rim makes provision for, and accommodates all the ordinary standard type portions, and yet there is only one member to detach to leave the tyre free. This is removable at any moment when desired. The construction will be better understood when we say that upon the periphery eight segmental blocks are mounted which carry the studs. Shrewsbury and Challiner tyres have long been known as of excellent material and well suited for the purpose of motor-cars of various degrees.

Tools, &c.

Messrs. E. M. RUSSELL AND CO., of the Junction Works Willesden, N.W., have a variety of tools for motorists on their stands, a specially useful device being the "Hydra" spanner. This is intended for use in positions where the ordinary form of tool would probably find inaccessible. It will work in the most confined space—anywhere, in fact, where the handle can be oscillated to the extent of an eighth of an inch. The "Gryp" and the "Newleva" spanners are also included in the display on this stand. The former is a practical form of ratchet spanner for nuts awkward of access, and can be worked at any angle. In addition to these tools Messrs. Russell and Co. also show the Kosmoid time recorders, which are becoming familiar to those who have occasion to visit the leading motor works, garages, and similar establishments.

Marston's Radiators.

The good work that has long characterised the productions of Messrs. JOHN MARSTON, LTD., finds illustration on the stand in the Gallery occupied by this firm. They are showing steel bonnet brass mounts and fittings, tinned steel pressure feed petrol tanks, and the Marston-Magevet honeycomb radiators, the latter of which constitute an important section of their display. There is no doubt as to the good impression left on the mind of the visitor by the various types of radiators shown, all of which have been made for leading makers. But, excellent as is the workmanship, the principle of construction is also commendatory, securing efficiency. The solder is run into all the joints of the tube by the gas blast process, which secures absolute strength and durability.

The Waterloo Garage Exhibits.

Apart from the Mors chassis attracting visitors to the stand of the WATERLOO AUTOMOBILE AND CARRIAGE WORKS, several notable examples of coachwork are deserving of special notice. This concern, which is owned by the Hon. Lyndhurst Bruce, has its establishment in Chicheley Street, York Road, S.E., near Waterloo Station, and include a large repair department, so that those who send cars thereto may rely on the character of the work likely to be done. In addition to garaging and repairing automobiles, motor-cars are also let on hire, the Waterloo Works thus being comprehensive in all departments. The coachbuilding branch is an extensive one, and additional interest is given thereto by the numerous specialities in Cape hoods, wind screens, &c., produced therein. Some of these will be found on the stand in the Annexe. In the Waterloo wind screen a serious and successful attempt has been made to reduce wind resistance to a minimum. In place of the usual flat screen parallel with the dashboard is a combined V shaped and sloping device. The two upper quarters can be raised or lowered independently of each other, so that the passenger by the side of the driver is protected, although the rain may necessitate the driver lowering the portion immediately before him. The same consideration of the owner or passenger is shown in the 20-h.p. De Dietrich exhibited with the steering wheel enclosed within the vehicle—a type of body to which the Waterloo Motor Garage have devoted much attention.

A good selection of clothing of seasonable design and in materials suitable for the present weather, is shown by Messrs. LOVEGROVE AND COMPANY, whose removal from one address in Piccadilly to another in the same thoroughfare we recently noted. Accessories of various kinds are also shown, including horns, lamps, goggles, &c., illustrating the ability of the firm to cater for all the requirements of motorists generally.

A new comer to the show is Mr. W. H. TYE, of 52, Great Queen Street, Long Acre, W.C., who makes a special feature of the "Whitely" patent landaulet head fittings. Here, too, will be found a good range of wind shields and other accessories to the luxurious car of to-day.

One of the most comprehensive displays of motor accessories is that of Messrs. BRANSOM, KENT AND COMPANY, LTD., which is inclusive of everything required by the modern motorist. Full reference to the special features of the exhibit will be made in our next issue.

Visitors to the Show will be interested in the combination Stepney spare wheels for heavy cars fitted with tyres of different sizes on the front and back wheels—an important development, a detailed description of which is reserved for a later issue.

Since the firm of Sayers and Co. entered the automobile industry at the Cordingley Motor Show of 1906 they have come well to the front as makers of high-class motor bodies. Now that the concern is known as the AUTOMOBILE CARRIAGE BUILDERS, LTD., its reputation should continue, judging from the appearance of the three-quarter landaulet body which forms the exhibit in the Annexe, and which is mounted on a 35-40-h.p. Fiat chassis. The folding pillars are the special feature of the vehicle.

(To be continued.)

Correspondence.

[Letters to the Editor should be addressed to the offices, 27-28, Charing Cross Road, London, W.C.]

THE WORLD'S RECORD FOR RELIABILITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In an official letter which I have received from the Royal Automobile Club, dated November 15th, it states that "the Committee cannot sanction the use of the word 'record' or the words 'world's record' by either your firm or the Rolls Royce firm in relation to the certificate of performance of the above-mentioned trials," hence Mr. Claude Johnson can lay no claim to a record for reliability.

Before claiming the world's record for reliability, I wrote to the Royal Automobile Club and asked them to give me their definition of the word "reliability." The definition they gave was: "The car which took the least amount of time and money in adjustments and repairs to keep running on the road," therefore seeing that the time and cost of repairs to the six-cylinder Hotchkiss during the 15,000 miles trial, and including labour (worked out on the same basis as done in the case of the Rolls Royce) was less than that of the Rolls Royce, I consider I had every right to claim the world's record for reliability. Mr. Johnson's contention that the world's record for reliability should go to the car that makes the longest non-stop run is, of course, childish, and nobody knows that better than Mr. Johnson himself, for in Rule 15 of Long Distance Trials it states: "The time occupied in adjustments or repairs, either before or after a run, or during a voluntary stop, together with the nature of such adjustments or repairs, shall be noted and stated on the certificate," hence it is very clear that, providing a car was able to complete its daily run without an involuntary stop, it could have its gears, engines, or, in fact, practically any part of it replaced in the motor house, without in any way spoiling its non-stop record. From this it is very evident that "non-stop" and "reliability" are two very different things.

The time spent on repairs and adjustments during the 15,000 miles trial of the six-cylinder Hotchkiss was 9 h. 44 min. 21 sec. as against 40 h. 13 min. in the case of the Rolls Royce, or a matter of 30 h. 28 min. 39 sec. in favour of the Hotchkiss. Mr. Johnston further states that the condition of the Hotchkiss at the termination of the trial was far inferior to the Rolls Royce, and that this inferiority must be due to lack of attention during the run or to inferiority of design, material or lubrication. Surely the boot is on the other leg; the natural deduction from the fact that it was necessary to spend thirty odd hours more on the Rolls Royce than on the Hotchkiss is that owing to its design, material, &c., it was necessary to work on the car all these hours in order to bring it through the trial in such a condition as to be able to obtain a satisfactory report from the R.A.C.

The parts taken from the Hotchkiss car and sealed by the R.A.C. are now being exhibited at Olympia and at the Paris Salon, so that anyone can see for themselves the perfect state that they are in and the almost inappreciable amount of wear. Certain parts are also exhibited on the Rolls Royce stand, but only one or two bear the seal of the Royal Automobile Club.

The Royal Automobile Club writes me further that my "firm, in respect of the performance of the Hotchkiss car, is entitled to claim that this car in its recent 15,000 miles trial accomplished the distance with an expenditure of less time for repairs and adjustments, on the road and in the motor houses, than that taken by any other car in any trial of similar distance officially observed by the Club up to that time."—Yours truly,

B. D. CORBET.

A WARNING FROM GRANTHAM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 16th inst., under a paragraph "Heavy Hauls," you mention that the borough of Grantham has gained £100 for its funds through fines on motorists.

The Grantham police had nothing to do with these cases, nor do the fines go the borough fund. They were all county cases tried at Spittlegate Police Station, which building is in our Borough, Grantham being the head-quarters of the Spittlegate petty-sessional division.

Fines to the amount of £55 aggregate were inflicted on motorists again last Saturday at the same place, and I would particularly advise all motorists to drive cautiously for twelve miles south to ten miles north of Grantham, as the police are very active along the twenty-two miles.—Yours truly,

T. A. PALMER.

A SIGNALLING CODE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think it would be greatly to the advantage of motorists if the horn were used for signalling purposes, somewhat after the style of the locomotive and steamboat whistle. At present it does not matter how many blasts are given. They simply mean the same thing.

A case in point. Two cars pass each other going in opposite directions after lighting up time, and one driver notices the other's tail lamp

is out. If it was possible for him to do so, he would inform the other driver, and thereby save him a heavy fine. In the case of a stranded car, it would be quite an easy matter for the driver of an approaching car to inquire if any help was required and receive his answer without stopping; and again, two cars approaching cross-roads at right angles to each other, it would simplify matters greatly if each driver knew what direction the other intended to take.

This could all be done quite simply by using the horn to an arranged code of signals, say,

One blast, I am going straight ahead.

Two blasts, I am turning to the right.

Three blasts, I am turning to the left.

Four blasts to mean "Your lamp is out."

Five blasts to mean "Do you require help?"

Two and one to mean "Yes."

Two and two to mean "No." &c.

I would like to see this idea taken up by other pens.—Yours truly,

WM. KENNEDY.

THE ATTITUDE OF THE DAILIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Nothing could have been more pronounced than the conversion of the general Press to the charms of motoring as a pastime and the resources of the industry from an advertising point of view. There seems

Overheard in Paris.

Ah! Monsieur, I thought you were at Olympia.
Non, Madame, this is the Show.

to have been a sudden cessation of motor accidents—unless a duke is involved, and no nasty reflections on the humanity of the motorist appear in the great dailies.

On the other hand, editorial references and advertising matter relating to particular cars now appear on the same pages in many of the papers, and all associated with journalism seem inspired with the one desire to secure the favour of the motoring industry.

Apparently many leading firms have snapped up the bait that has been offered them, and, for a time, are spending huge sums to reach a few of the many readers of the general Press. Only 4 or 5, if that, per cent. of those who take a daily paper are prospective motorists, and it apparently has not occurred to the trade that they have to pay as much to reach that small proportion as the advertiser who has something to interest 90 per cent. of the newspaper readers.—Yours truly,

A. WALKER.

THE ACTION OF CARBURETTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your description of the "Perfecta" carburettor, I should be obliged if you or any reader of the *M.C.J.* could give me an explanation of a statement contained therein. In the description it is stated "The new apparatus has been designed with a view of obtaining an unvarying proportion of petrol and air, irrespective of the speed of the motor or the demands of the latter." I understood that the practice of using a constant mixture for all speeds had been tried and found wanting. Is not the extra air admitted to the carburettor, at high speed, in order to decrease the quantity of petrol per stroke? When running at

high speeds less air is taken into the cylinder owing to the inertia of the air and the short time of the suction stroke. When running as slow as possible, is it not necessary to increase the quantity of petrol per stroke? Is it not correct that a weaker mixture is desirable, owing to the increased compression at high speeds, there being danger of pre-ignition?

In the sentence I have quoted from your description appear the words "irrespective of the speed of the motor or the demands of the latter." This would point to the fact that the engine demands a varying mixture. —Yours truly,

SYDNEY WRIGHT.

INCONSIDERATE DRIVING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some of your readers wonder, no doubt, why the general public dislike motor-cars. It is not the machines themselves to blame, for they are excellent inventions, but the people who use them, a great number of whom seem to think that all roads are maintained especially for their use, and it is of no concern to them who or what may be damaged by their car. To justify these statements allow me to recount an incident that happened on the 5th inst., near Towcester, Northamptonshire, on the main road between London and Coventry. A shepherd was driving a flock of sheep along a straight, broad piece of road with a slight slope to the town of Towcester, when a car dashed down into the sheep, killed one and damaged many more (two have died since). The shepherd helped to extricate one sheep from under the car, and the person driving, who appeared to be the owner, promised faithfully to call at the police station in Towcester and report the occurrence, but failed to do so. The shepherd unfortunately, relying on this promise, did not take the number of the car, but noticed the registration was D.U. (Coventry). The car owner cannot be found, so the farmer has to lose £9 or £10, besides the damage to the other sheep.

It may be added that the farmer in question is a large ratepayer in the district, and that the Local District Council and County Council expend a considerable sum annually in tarring roads and extra expense found absolutely necessary to life in Towcester, besides which

The Battle of the Radiators.—From a sketch issued, needless to say, by a maker of the ribbed-tube type.

the cost of road maintenance in the district is considerably increased by the wear and tear caused by the studded wheels of the large number of heavy cars which make use of the roads in the district. If such accidents as these are common, how can motorists expect the slightest consideration from anybody?—Yours truly,

H. JACKSON STOPS.

BALL v. PLAIN BEARINGS FOR CRANK SHAFTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I learn with considerable surprise that the Hotchkiss Company have decided to cease fitting ball bearings to the crank shafts of their motors, and to revert to the use of long plain bearings. In view of the fact that the show reveals several new additions to the list of firms using ball bearing crank shafts, it would be interesting to know what has led the makers of the Hotchkiss cars to this decision. —Yours truly,

BRIGHTONIAN,

MR. EDGE'S CHALLENGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read a letter from Mr. Huntley Walker in your last issue referring to myself. I am sorry that, in view of Mr. Walker's previous change of ideas in regard to making a challenge and then withdrawing from the conditions in his original letter, although I accepted them, I can only consider a challenge of his serious if made through the Brooklands Automobile Club or some official body, and the conditions of the challenge bound by a substantial monetary deposit. I would also

like to make it quite clear that if Mr. Walker wishes to race me, when we race his and my cars shall be the only ones on the track or road at the time.—Yours truly,

S. F. EDGE.

WHY SOME PEOPLE FIND THEIR CARS EXPENSIVE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is really surprising to notice the difference in the running costs of two cars of the same manufacture and the same power, with two different owners. Where does it come in? Well, I will suppose that all things are pretty well equal as regards the roads, load carried, &c. Tyres are the first and most important matter. The economical owner will probably specify larger tyres—at any rate, on the back wheels—when he buys the vehicle. Cars nowadays, in particular the smaller four-cylinder type, are dreadfully under-tyred, and, curiously enough, their owners never seem to think that the manufacturers could possibly fit too small a section of tyre on their cars! There is a very well known fairly small four-cylinder car, which has earned itself a splendid reputation for reliability and hill-climbing, particularly the latter. This particular car has 90 mm. section tyres, and its weight is well over 18 cwt. But its owner does not think so. Ask him the weight and he will approximately put it at 14 or 15 cwt., and naturally never dreams that the tyres are ridiculously light for their work. Motorists should always look to the tyres when ordering, and if there is any doubt, pay a little more in the first instance and have a larger tyre, and it will fully pay them in the long run.

There now comes the question of the care of tyres. The careless owner will blow his up now and again when he thinks of it, but the economical owner will make a point of testing his tyres systematically, and inflating them according to the maker's instructions. The careless man will think nothing of the oil and grease which gets bespattered on his tyres, and yet he will one day be surprised to find them burst. The economical man will stop the oil and grease from getting on the tyres, and so will save both the oil and the tyres.

There are other details about tyres, e.g., filling up cuts by vulcanising, &c., which greatly increase the value of a cover, but how often is this done? Passing on to other parts of the car, there is the lubrication. Here is a matter which is quickly settled by the careless owner; he will have his new car, and will doubtless be told by someone or other that so long as he keeps a bit of a smoke on he will be all right; consequently his car will always be over-lubricated, and whenever he stops there will be a pool of good lubricating oil left on the road! The economical man will take some time and trouble to study his engine and gear, &c., and, assisted by the manufacturer's book, will find how to set his lubricators to the best advantage.

Now petrol is not in itself a very costly item, but it mounts up in the course of the year, so it is worth mentioning. The careless man usually spills a pint or two putting it in, and he never thinks of questioning the mileage per gallon of his car, whereas the economical owner sets to work to get the very best possible results from his carburettor. The writer has not said anything about actual usage. Of course we all know that a good car can be ruined in no time by indifferent driving, but for the purpose of this letter, which is to point out the little things which are so frequently overlooked until they become big things, the two owners are presumed to drive equally well.—Yours truly,

AN OLD HAND.

AN ENGINE STARTING DIFFICULTY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I will take it as a favour if you can help me in the following difficulty. I have an M.M.C. 8-h.p. single-cylinder car. When I got the vehicle the engine would start with the ignition lever a very little advanced, now I cannot get it to start at all unless I advance ignition as far as I can get it, with the result that every time it starts it flies back a dozen times, and nearly knocks my head off. I have had a new plug put in and the accumulator is newly charged; it is high tension ignition.—Yours truly,

AN AMATEUR MECHANIC.

[We think it possible that there is something wrong with the contact on the engine commutator. The M.M.C. car is probably fitted with a "wipe" contact, and if the first portion of it be worn or burnt away, i.e., that portion on which the wipe blade first rubs, it will of course be difficult to start in the retarded position, as it may fail to make contact. But when "Amateur Mechanic" advances the ignition lever, it will then be on a good portion of the wipe metal inset, and so fire, with the unpleasant consequences he records. If our supposition is correct, the remedy will be to have the commutator trimmed up in a lathe, and the wipe blade set to bear firmly all round the periphery of the commutator disc.]

WE have an inquiry for the address of the maker of the Caesar non-skid band.

"S. H. B." who asks where he can dispose of some worn-out motor tyre covers, is referred to our small advertisements under Trade Announcements.

DETACHABLE RIMS.—"R. F." writes asking readers of the *M.C.J.* to give their experiences of detachable rims, as he is anxious to find the most practicable design.

CLUBS AND ASSOCIATIONS.

THE MOTOR UNION.

THE annual dinner of members of the Motor Union of Great Britain and Ireland was held at the Hotel Great Central last week. Mr. C. D. Rose, M.P., the chairman of the union, presided, and after the loyal toasts the chairman proposed that of "Motoring." He said it was realised in the present day that even an inexperienced motorist could control his car better than an experienced driver could control his horse, and it was not impossible to imagine that in the near future it would be considered a case of cruelty to animals to put horses to draw heavy burdens.

Sir John French, in responding, spoke of the influence of the automobile upon the science and practice of war. Owing to the development of modern firearms and the enormous hosts which were maintained by every great Power in the world, the extent of ground over which military operations were conducted—the size of a modern battle-field—had become infinitely greater than in former days. In consequence of the change, commanders of armies in the field had lost a power which the commanders of old exercised—that of exercising their personal influence and control over the fight. But from experiments which had been made lately, and also from experiments which had been tried in foreign countries, they had come to the conclusion that in the next great war it would be found that the automobile would in a great measure restore this lost power to the hands of the Commander-in-Chief, and that he would possibly be able to exercise nearly as great an influence over the course of a fight as was exercised in the days of Wellington and Napoleon. This was one very important development that had been effected by the automobile. But it in the actual field of battle the automobile had conferred such a tremendous advantage, they had entirely proved its value in the training and instruction of the troops for war. It had been the custom to give officers instruction over very large tracts of country, and in the difficulty experienced in getting over these large tracts of country the automobile had been of immense value. A motor corps had for some time past formed part of his Majesty's Forces. It gave him the greatest possible pleasure to testify to the patriotism, self-sacrifice, and devotion which had been shown by the members of that corps in the assistance which they had rendered to the Army. If the men of England required an example of how to do their duty in the way that Mr. Haldane asked them to, they would find a good example in the work which had been done by—first, the Army Motor Volunteer Corps, and, secondly, by the Army Motor Reserve.

Sir Alfred Fripp, who next responded, spoke of the advantages to be derived from the use of the automobile by medical men. The doctor benefited in a saving of time and an increase of leisure; and a doctor with some leisure was a safer man than one who was always "on the rush" and who looked at his watch behind the door, just before he went into the sick room, to see how many minutes he could give to his patient.

The Chairman, replying to the toast of "The Motor Union of Great Britain and Ireland," proposed by Mr. Roger Wallace, K.C., said that motorists would be well advised not to hurry forward legislation in any way, although they were not satisfied with the conditions as they stood at present. At a country gathering of the Motor Union recently, he had stated that there was then a small cloud on the horizon, but that he firmly believed that they would be able to dissipate it. He was glad now to be able to say that the cloud had disappeared entirely, and that the relations between the Automobile Association and the Motor Union were absolutely sound and solid. They were all aware of the close relations which had existed between the Royal Automobile Club and the Motor Union. They had been working together under a common agreement for the past eighteen or twenty months. It was not necessary for him to go into any questions of detail with regard to the working of that agreement. But it had come under very careful consideration, and at their meeting that afternoon the committee had resolved to give notice to terminate the agreement. They thought that that course was in the best interests not only of the club, but of the Motor Union, and of the general motor industry.

THE SOCIETY OF MOTOR MANUFACTURERS AND TRADERS.

A MEETING of motor agents was held on Friday of last week at Olympia. This meeting had been specially called to consider the steps to be taken to give effect to the recent decision of the Society of Motor Manufacturers and Traders, empowering the council of the society to form local centres. The chair was taken by Mr. W. M. Letts, who is the chairman of the committee of the agents' section of the society, and he was supported by the majority of the members of that committee. Over a hundred agents were present, representative of all parts of the country; amongst them Mr. Taylor, secretary of the Manchester section, and Mr. Barton, secretary of the Nottingham centre. The chairman and other members of the committee addressed the meeting, stating fully the reasons for the formation of the proposed centres, and the views of the society in connection therewith. This was followed by a discussion, after which it was unanimously resolved that such action was desirable, and several of those present undertook to proceed at once with the formation of centres in their respective districts.

BROOKLANDS.

THE Brooklands A.R.C. has received four challenges from Mr. S. F. Edge in connection with races to be run prior to July 1st, 1908, and after May 14th next, on the Brooklands track. The challenges are as follows, and are open till the 14th prox., being for £250 or more.

Four or six-cylinder Napier car against any one car of a B.A.R.C. cylinder dimension (D2N) 64 or under. Weight: 2,000 lb. (B.A.R.C. definition). Distance: Five laps, standing start.

Six-cylinder Napier car against any one car of a B.A.R.C. cylinder dimension (D2N) 100 or under. Weight, 2,500 lb. (B.A.R.C. definition). Distance, six laps, standing start.

His six-cylinder Napier car against any one car of a B.A.R.C. cylinder dimension (D2N) 150.1 or under. Weight, 2,700 lb. (B.A.R.C. definition). Distance, eight laps, starting point.

Six-cylinder Napier car against any one car of a B.A.R.C. dimension (D2N) 225.1 or under, for £250 or over. Weight, 3,000 lb. (B.A.R.C. definition). Distance, ten laps, standing start. Challenge open until December 14th.

The Brooklands Club hold the stakes of £250 each for the above challenges, and any acceptance should be addressed to the secretary, accompanied by the necessary stakes.

SCOTTISH.

MEMBERS are now being admitted on payment of subscription for the year ending January 31st, 1909.

The annual dinner will take place in Edinburgh on Tuesday, January 28th, next. Lengthy consideration has been given by the executive of the club to the action necessary to put down reckless driving and particularly fast driving in populous places, and a number

One of the Fleet of Six 12-h.p. Two-Cylinder Mail Vans recently built by Messrs. Dennis Bros. for Messrs. McNamara and Co., Mail Contractors.

of cases have been before the committee dealing with the subject and various others are receiving their consideration.

THE Lord Lieutenant of Ireland has consented to open the motor show of the Irish Automobile Club at Dublin on January 4th, 1908.

THE committee of the Ladies' Automobile Club have decided to limit the membership to 450. It now stands at 400, so that there are but fifty vacancies.

MR. F. PARTINGTON, the president of the Blackpool and District Motor Club, has issued invitations to a dinner at the Hotel Metropole, Blackpool, on Friday, the 29th inst.

THE medals won by members at the recent competitions of the Leicestershire Motor Cycling Club were presented at a concert on Friday, the 15th, when Mr. R. Sutton Clifford, jun., presided.

WE understand that Mr. F. F. Wellington, who left England some time ago to take up his appointment as manager of the Spyker Company in Amsterdam, has not up to the present been given that position because of the differences existing between the bankers and Mr. Spyker. The business has been placed in the hands of the Dutch courts, and the matter in dispute will not be settled until after Christmas.

IN the advertisement of S. F. Edge, Ltd., which appeared in our issue of the 26th ult., referring to the list of six-cylinder Napier hill-climbing successes, there was one line which read "May 3rd, Frome's Hill Climb, six-cylinder Napier first." This should read "first in big class," as there were a number of different classes, and also a general classification class which was won by the little British Talbot on efficiency.

EXAMINATION QUESTIONS IN MOTOR-CAR ENGINEERING.

BELOW we give some specimen questions set in the last examination of the City and Guilds of London Institute, reference to which is made in the Comments in another part of the present issue.

ORDINARY GRADE.

Sketch two kinds of float feed-chambers, showing constant level regulating arrangements but not the rest of the carburettor. One should be of the ordinary cone-pointed needle type and the other the ball-valve type. State briefly which is the better for pressure-fed petrol, and why, and which is less likely to allow the petrol to leak past the valve when the engine is not running.

If the steering wheel of a car be turned right round to the left and fixed there, the car will move in a complete circle; sketch, in plan, the frame of the car in four lines, and show the four wheels, the four circular tracks they will describe, and the Ackermann arms and coupling rod connecting the front wheels. The circular tracks should be drawn with compasses.

Of what material should the sparking points of a commercial sparking plug be constructed? If the porcelain be cracked, why does the engine sometimes misfire, although the distance between the points is only $\frac{1}{8}$ in. and the distance across the crack is $\frac{1}{16}$ in.?

A four-cylinder engine is misfiring on one cylinder, and it is known that it is due to faulty ignition. How would you systematically set about to locate the fault?

Give briefly all the reasons you know for using double or triple expansion in steam engines. How do your statements apply to the engines used on steam cars?

About how many ampere hours would you expect to be obtainable from every pound weight of a two-volt cell in an electric car battery?

HONOURS GRADE.

(Candidates for Honours must have previously passed in the Ordinary Grade.)

State precisely what materials you would use for constructing the following car parts:—Piston rings. Conduit for the insulated high-tension leads. Front axle. The magnets of the magneto. Gear wheels in gear-box. The "small end" bearing of the connecting rod. Propeller-shaft brake drum and brake lining.

Give a diagram showing how you would charge two 30-ampere hour 4-volt accumulators from a 100-volt town lighting circuit. State (a) how you would find the direction of the current; (b) what current they would be taking under the conditions which you indicate, and give the time necessary to fully charge the batteries.

The flame of a paraffin burner occasionally "surges," i.e., it swells up and dies down at regular intervals. Explain the cause of this.

Sketch, and name one type of flash or semi-flash steam generator. Explain how the temperature and pressure of the steam are controlled without much attention from the driver.

About how many ampere hours would you expect to be obtainable from every pound weight of a 2-volt cell in an electric car battery? Supposing a car weighs 25 cwt. in all, of which 10 cwt. is battery, how far would you expect that car to travel on one charge over ordinary roads? Show how you have calculated your result.

HONOURS GRADE.

(DRAWING EXAMINATION.)

Sketch a good arrangement for an automatic air inlet valve for a single-cylinder water cooled engine, such that the valve and valve seat can be removed and replaced quickly, and the seat will be pressed uniformly on its joint.

The bore and stroke of a water-cooled engine are 3 in. and 4 in. Sketch, half full size, a section of the cylinder and piston, showing crank shaft connecting rod and one valve. The dimensions should be judged by eye and should not be inserted. Marks will be awarded for correct proportion.

DEATH WHILE DRIVING A CAR.

THE inquest on Herbert Winfield, coachman and chauffeur to the Hon. W. F. D. Smith, M.P., who died suddenly while driving Mr. Smith's car, was held on Friday of last week, at Greenlands, near Marlow. Miss Caroline Wray said she was returning from Marlow in a car with the Hon. Mrs. Brookes when a tyre was punctured and Winfield put on a spare tyre. Just before reaching Greenlands the car went across the road, over a small ditch, and ran into a fence. Witness had some difficulty in getting out of the car, and she then found the deceased was leaning forward over the steering wheel. His foot was on the brake, and he had attempted to put on the hand brake. Mrs. Brookes went for help, but deceased expired almost immediately. Dr. Egerton Baines said death was due to the rupture of a blood-vessel of the brain. A verdict was returned in accordance with the medical evidence.

MESSRS. CLEMENT-TALBOT have photographed the fine array of trophies, medals, &c., won by Talbot cars during the season 1906-07, mostly by private owners, shown at their stand at Olympia. The total value of the awards on view amounts to £1,000, two police officers being in attendance day and night to guard the valuable trophies.

A COLLISION IN THE FOG.

MR. R. KEMPE, deputy coroner for Chiswick, has held an inquest respecting the death of John Ellis Dear, a lamplighter, who was killed in a motor-car collision during the fog of last week.

Joseph Ward said that about 11.30 p.m. on Monday, during the fog, he was standing on the back platform of a tram going towards London, and when near Gunnersbury Hill he noticed another tram about twenty yards in front. Looking towards Kew he saw a motor-car coming up on the near side of the road, and it whizzed past the tram at seventeen or eighteen miles an hour, as though the driver had not got proper control of it. The witness thought it was going to run into his tram, but it passed it and just afterwards there was a crash, and the witness found that it had run into a market van which was travelling on the near side of the road. No horn was sounded, and the road was greasy. He saw the deceased, who was injured. Death took place almost immediately afterwards. George Carpenter, the driver of the car, and a caretaker at the works of the New Speedwell Motor Company, said that he was quite sober. He said that he was only going at seven to eight miles an hour. He sounded his horn, but did not hear any warning from a tram driver. The tram's light was dazzling, and he did not see the van in front till it was too late, but he applied the brake.

The jury returned a verdict declaring that Carpenter was not exercising the judgment he should have done, particularly in the fog, but did not find him culpably negligent.

The Coroner.—In this case the jury have taken a merciful view. (To Carpenter): They find that you have been careless, but not to the extent of manslaughter. I hope it will be a warning to you.

MOTOR TYRE ACTION.

A RECENTLY patented motor-car tyre not yet placed on the market has just been the subject of an action in the Manchester County Court. The plaintiff, Mr. Richard Wood, of Denton Street, Hulme, is the patentee of the tyre, and sued Messrs. Thomas Dowler and Son, of Sugar Lane, Manchester, for £16 9s. 2d., of which £6 9s. 2d. was money paid by him to the defendants, the remainder being described as a merely nominal sum in respect of loss sustained by three months' delay in the carrying out of an order. Producing a sample of the tubes, he explained his invention to Judge Parry, and pointed out that one of the most important particulars was that the hole by which the sections were connected should be exactly three-eighths of an inch in diameter. The holes in the goods supplied, however, were either five-sixteenths or four-sixteenths of an inch in diameter, and were therefore absolutely useless for his purpose. After hearing the case, His Honour remarked that the defendants had evidently made a bad bargain, but that did not excuse them from not fulfilling the contract according to specifications. The plaintiff's invention was an ingenious one, and in order to make any use of them the tubes should have been of a uniform diameter. As they were not uniform the plaintiff was entitled to go elsewhere and to recover what he had paid. He could not allow anything for special damages, but the plaintiff must have judgment for the £6 9s. 2d., with costs on the scale of that amount.

CLAIM AGAINST MOTORIST.

AT the Grays County Court, before Judge Tindal Atkinson and a jury, the action brought by John Sparks to recover damages amounting to £20, from William Frost, landlord of the White Hart Hotel, High Street, Grays, for personal injuries sustained through the alleged negligence or carelessness of the defendant in driving a motor tri-car, has been heard.

After hearing the evidence, His Honour summed up. He said that motor-car cases were becoming very frequent in Courts of Justice, and one had to regard the fact that these vehicles, whether they were an element of danger to the traffic on the highway or not, had a right on the roads, and, further, to use them as much as any other vehicle. Foot-passengers and persons riding other kinds of vehicles had to recognise the fact that the motor-cars were on the road, and that they had come to stay. With that element of danger in the highway, it was necessary, of course, for passengers to exercise much more care in the way in which they used the highway than they would have done before motors came into existence. The jury returned a verdict for the defendant with costs, and were of opinion that Mr. Frost had promised the plaintiff that he would pay his out-of-pocket expenses. They hoped he would carry out that promise.

FROM Messrs. G. H. Wait and Co., Leicester, comes a copy of the new catalogue of the Clyde cars. This gives full particulars of the various models, 8-10-h.p., 12-14-h.p. and 16-20-h.p., as also of the Clyde motor-bicycles.

FIAT MOTORS, LTD., inform us that six Fiat cars have recently been shipped to their Victorian agents—Messrs. the Tarrant Motor Co., Melbourne—and five exceptionally handsome cars are now being despatched to their Egyptian agents—the Cairo Motor Agency. The latter cars—three of which are of 30-40-h.p.—are fitted with specially-built bodies by Messrs. Rothschild et Fils, of Horseferry Road, S.W.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING LEGAL LIMIT.

At Greenwich, Charles Woodward, of Maida Vale, has been summoned for driving a motor-car at a speed exceeding twenty miles an hour in Lewisham High Road. Mr. Stubbs, who defended, admitted that his client was fined at Woolwich the previous week for exceeding the speed limit. Defendant was then fined £20 and 2s. costs.

A TRIPLE CHARGE.

At Brentford on Saturday a story of a chauffeur's experience, after driving his master to Oxford in a 60-h.p. car, was told when Alphonse Berudelort, 30, a Frenchman unable to speak English, was charged with reckless driving, with failing to produce his licence when requested, and with not stopping after colliding with a horse and van. George Laws said that just before midnight on Friday he was driving his van in Ealing, when the prisoner, driving his motor-car on the wrong side of the road, dashed up. The car struck the horse and spun it round, breaking the shaft of the van. As the prisoner would not stop, the witness ran into Ealing police-station, and they telephoned to the police at Acton, two miles away. In less than five minutes the prisoner was stopped.

The prisoner admitted driving on the wrong side of the road, but denied going fast, and said that he did not hear the police at Ealing call upon him to stop. He was fined £10 on each of the first two offences, and £2 on the third—£22 in all.

ROAD REPORTS.

TEDDINGTON.—The Teddington District Council have passed a resolution, to be forwarded to the Middlesex County Council, requesting that body to consider the advisability of erecting a new bridge for vehicular traffic over the Thames at Teddington.

STAMFORD.—During the next few weeks Mr. F. R. Ryman, the borough surveyor of Stamford, will be repairing a short length of the Great North Road near the Stamford and Rutland boundary. Another thoroughfare under repair in this district will be a length of about a quarter of a mile of the Deeping road.

DUNSTABLE.—All the main roads in this district have been repaired, and no further work of this kind will be undertaken until next spring, so that motorists travelling that way will have a clear road.

MID-SUSSEX.—The road-repairing season in Mid-Sussex began about two months ago, but, thanks to the system adopted, rough edges on the new road patches are quickly taken off and little inconvenience caused to motorists. We understand that the repair work in the locality is likely to be continued throughout the winter.

RENFREWSHIRE.—Mr. James Gibson, the road surveyor for the Gorbals Division of Upper Renfrewshire, has prepared for the use of his District Committee a report on the experiment which has been made on the Kilmarnock road at Whitecraigs with tar macadam as a means of laying dust. He says that owing to the heavy motor traffic which passes along this road the surface of the tar macadam patch has got knocked out of shape, and will require to be patched with ordinary fine metal. The macadam has been a success as a dust layer where traffic is light, but it will not do on a highway such as Kilmarnock road.

COMPANY NEWS.

U. M. I.—The annual general meeting of the United Motor Industries, Ltd., was held on the 15th inst. The year closing has been one of great prosperity to the company. Their method of trading chiefly for cash has enabled them to materially reduce prices. The result of this cash policy has been that the directors are enabled to declare a dividend of 20 per cent., to carry forward a considerable sum to reserve, and at the same time state that further important agencies have been obtained for very valuable motor accessories, that the business as a whole shows every sign of advancement and expansion, and that the system of low prices in return for cash payments will be adhered to for the coming 1908 season, which is certainly opening with even brighter prospects for the future than in the past. The Eagle Works for the manufacture of "Castle" coils and "Castle" accumulators has now been fully established.

WHITFIELD AUTOMATIC TYRE INFLATOR COMPANY.—£5,000. To acquire all the rights for the United Kingdom and elsewhere in an invention known as the Whitfield Automatic Tyre Inflator, granted to Messrs. C. R. Whitfield and W. R. Harrison, with the sole right of manufacturing the same in the United Kingdom and elsewhere. 28, Albert Road, Middlesbrough.

INTERNATIONAL AUTO SCHOOL.—Registered in Guernsey with a capital at £10,000 (2,500 £4 shares, of which 1,250 are working capital, and 1,250 may be issued in payment of the consideration of the contract entered into with Mme. Randinneau, of Paris). To carry on, in France and elsewhere, the business of teaching the art of driving motor-cars, and to establish, in Paris or elsewhere, colleges or schools for that purpose. First directors: E. Parent, 14, Rue Taitbout, Paris, and A. Alabarbe, 11, Rue Guersant, Paris.

SCOTT NON-SKID AND TYRE COMPANY.—£4,000. Manufacturers of and dealers in all kinds of non-skid appliances for the wheels of motor or other vehicles, motor and other tyres, &c., and to adopt an agree-

ment with Mr. H. J. Scott. No initial public issue. First directors: Major C. B. FitzHenry, Messrs. W. A. Turquand, and E. A. Gedge, Norfolk House, Laurence Pountney Hill, E.C.

HYDE PARK MOTOR STORES.—£5,000. As title. No initial public issue. 12, Park Mansions Arcade, Knightsbridge, S.W.

STROM.—£30,000. To arrange for the acquisition of the business of ladies and gents' outfitters and costumiers (particularly in relation to motoring and sports) carried on at Paris and Nice by Strom. No initial public issue. 1, Broad Street Place, E.C.

CARDIFF AND COUNTY MOTOR COMPANY.—£2,000. As title. No initial public issue. Twenty-five shares.

AUTOMOBILE INVESTMENT CORPORATION.—£1,000. No initial public issue.

A. DARRACQ AND CO., 1906, LTD.—The report of this company for the year ended September 30th, 1907, shows that, after payment of £15,000 to the debenture service fund, the dividend on the preferred ordinary shares distributed on April 2nd, 1907, and the interim dividend on the ordinary shares at the rate of 2s. per share paid on June 20th, 1907, there remains a balance to the credit of profit and loss account of £179,507. The directors have placed £100,000 to reserve, and after providing for the dividend on the preferred ordinary shares, paid October 1st, 1907, a further dividend is now recommended on the ordinary shares at the rate of 2s. per share free of income tax (making 20 per cent. for the year), leaving £27,632 to carry forward to next year's account.

AUTOMOBILE ACCIDENTS.

LATE on Saturday night the Duke and Duchess of Portland had an unpleasant experience while motoring from Hucknall Torkard to

One of the Mors Lorries which did excellent service in the recent French Military Manœuvres.

Welbeck Abbey. They were being driven by their chauffeur, Andrew Hunter, and when near Mansfield they met at four cross roads a horse and dray. The driver of the latter apparently did not hear the hooter, and the car came into collision with the vehicle. The chauffeur was thrown through the glass screen, and was badly cut about the head. The duke and duchess were shaken, but escaped without injury. Hunter's injuries proved to be serious, and it is feared that he may lose the sight of one eye. The car was travelling at a very moderate rate of speed and the weather was slightly foggy.

At an inquest held on Monday by the City of London coroner on a gentleman who was fatally injured last week by a motor-bus, Superintendent Basson, of the Public Carriage Department, New Scotland Yard, said they licensed all the 'buses. In 1904, with thirty-one licensed motor-buses, two deaths occurred; in 1905, with 241 licensed, three deaths; whilst in 1906, with a little over three times as many 'buses, 783—the number had increased by more than eight times, totalling twenty-five. The jury returned a verdict of accidental death, and added as a rider that owing to the alarming increase in the number of accidents and deaths the coroner should call the attention of the proper authority to the matter, with the view to the restricting of the speed of motor-omnibuses in the City area.

FORTHCOMING EVENTS.

NOVEMBER.

The November number of the *Industrial Motor Review* is published.
 22nd (F.).—Stanley Show opens.
 23rd.—Last day of the Olympia Show.
 26th (Tu.).—Annual Dinner of the Aero Club at the Savoy Hotel.
 30th (S.).—Annual Dinner of the North London A.C. at the Midland Grand Hotel, London.
 Stanley Show closes.

DECEMBER.

1st (S.).—Last day of the Paris Motor Show.
 2nd (M.).—Cheshire A.C. annual dinner.
 5th (Th.).—Exhibition at Berlin.
 7th (S.).—Annual Dinner and Presentation of Prizes in connection with the Essex Motor Club.
 Annual dinner of the Hertfordshire C.A.C.
 11th (W.).—Southend and District M.C. annual dinner.
 Incorporated Institute of Auto. Engineers.—Mr. Dugald Clerk on the "Principles of Carburettors."
 12th (Th.).—Annual Dinner of the Sheffield A.C.
 18th (M.).—General Committee of the Motor Union.
 21st (S.).—Opening of the Brussels Exhibition.
 26th (Th.).—Annual Reliability Trial of the Motor Union of Western India.

JANUARY, 1908.

4th–11th.—Dublin Motor Show.
 9th (Th.).—Dinner of the West Essex A.C. at Seven Kings.

FEBRUARY.

7th–15th.—Manchester Motor Show at Belle Vue.
 12th (W.).—Mr. F. W. Lanchester on "Problems of Automobile Design," at the Incorporated Institute of Automobile Engineers.
 15th (Sat.).—Auto-Cycle Club Annual Dinner.

MARCH.

21st–29th.—Cordingley's Motor-Car Show at the Agricultural Hall, London.

LIGHTING-UP TIMES—LONDON.

INLAND REVENUE.

EARL DE LA WARR was summoned at Westminster by the Inland Revenue authorities for keeping a motor-car without the carriage licence. Mr. Shaw said Earl de la Warr formerly had a car under a ton in weight, which required a two-guinea licence. This was taken out late in the year. Very soon after the Earl bought or exchanged it for a heavier car, for which a four-guinea licence was required. Counsel for defendant said he was sorry there had been a mistake. Mr. Curtis Bennett imposed a fine of four guineas and 23s. costs, to include the licence, remarking that it was optional with the Revenue Commissioners whether they made allowance for the two-guinea licence which defendant held.

POLICE TRAPS.

THE well-known traps on the main road from Glasgow to Carlisle have been in almost daily operation of late.

WITH reference to the police traps that we recently intimated would be established in Beckenham, we learn that these are now working in the High Street, and also in the Croydon, Rectory, and main Beckenham roads which lead into it.

PUBLIC MOTOR SERVICES.

THE Chief Constable of Brighton (Mr. W. B. Gentle) has prepared a report on the motor-buses of the town, in which he recommends that a few more licences for spare motor-buses should be granted, so that a bus may receive attention when any part of the machinery goes wrong.
 A MOTOR-BUS has commenced to run between Helmsore and the entre of the town of Haslingden.

FROM Messrs. Panhard and Levassor, of Acton Vale, W., comes a copy of their latest accessory catalogue, which gives particulars of a wide range of useful fittings, including lamps, accumulators, screens, hoods, speedometers, magnetos, carburettors, lubricators, &c. Reference is also drawn to the firm's coach-building department, and their facilities for executing repairs of all kinds.

BUSINESS NEWS.

THE showrooms of Messrs. Charles Baker and Company at 137-140 Tottenham Court Road, W., contain a varied display of motorists' clothing for the season.

ABOUT fifty lots were included in the November auction sale of automobiles conducted by Messrs. McDonald and Son at the Great Eastern Motor Mart, Annandale Street, Edinburgh.

THE CENTURY MOTOR COMPANY, of Holland Gate, High Street, Kensington, W., are introducing a new French-built 20-30-h.p. four-cylinder car known as the Weyher-Richmond. Sound workmanship, simplicity of design and easy control are some of the principal features claimed for the new vehicle.

THE MOTOR IMPORT COMPANY have lately opened commodious premises in Hereford Street, Christchurch, New Zealand. In addition to importing cars, the company will carry a large and varied stock of accessories and spare parts for different vehicles.

THE address of the Northern Automobile Company is Oak Lane Garage, Manningham, Bradford, and not Birmingham, as stated in the last issue of the *M.C.J.*

THE Dietz motor lamps are the subject of a neat list issued by Messrs. Monnet, Plasse and Co., 20, Store Street, W.C., the wholesale factors in this country.

MESSRS. GAMAGE, of Holborn, made the liveries for the drivers of the King of Spain's Daimler cars.

MESSRS. ALFRED DUNHILL, LTD., have a magnificent sable fur lined coat at their stand at Olympia, the value of which runs into four figures.

MR. W. G. WESTON is now with the Avon India Rubber Company, Ltd., Melkham, Wilts., who will also conduct business temporarily at 31, Brooke Street, E.C., under their name and will continue to supply Avon Tyres, &c., from stock.

THE ATLAS ENGINEERING COMPANY, Levenshulme, Manchester, manufacturers of composite road wheels for all kinds of vehicles, detachable rims, flanges, &c., have taken offices at 111, Piccadilly, London, W., where they will have on view all classes of wheels and detachable rims for inspection by prospective customers.

MESSRS. J. KEELE AND CO., of 23, Brook Street, W., have again been appointed wholesale and retail agents for London and district for the Darraq Company. Having placed a large contract with the Darraq Company for their new 1908 models, they will now be in a position to give immediate delivery of these cars.

THE Eastbourne excursion for their agents organised by Mr. T. C. Pullinger, the Beeston manager of Messrs. Humber, Ltd., has become quite a regular feature of show week. At nine o'clock on Sunday morning a long string of Beeston-Humber cars assembled outside the Humber depot at Holborn Circus, E.C., and thence a delightful non-stop run was made down to Eastbourne, where lunch was partaken of at the Cavendish Hotel. After an hour or two by the silvery waves the six cars swung smoothly and steadily back to London in time for dinner after a most delightful day. The following Humber agents took part in the outing:—Mr. Geo. Ace, Tenby; Mr. J. V. Madgwick, Bolton; Mr. J. S. Cordingley, Haslingden; Mr. H. J. Croft, Kendal; Mr. T. Dyson, Bradford; Mr. W. B. Kinsop, Newcastle-on-Tyne; Mr. G. Webb, Monmouth; Mr. A. E. Merigold, Preston; Mr. W. L. Sleigh, Edinburgh; Mr. R. M. Wright, Lincoln; Mr. T. Garner, Manchester; Mr. R. B. Delafield, Plymouth; Mr. J. Chilton, and Mr. W. H. Smith, Huddersfield.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-28, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case, otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, NOVEMBER 30, 1907.

[No. 456.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

"THE INDUSTRIAL MOTOR REVIEW."

"THE INDUSTRIAL MOTOR REVIEW," which, established in February, 1903, can claim to be the oldest journal in the world exclusively devoted to the interests of the commercial and industrial motor vehicle, has been acquired by Messrs. Cordingley & Co., and is now published from the office of *The Motor Car Journal*, 27-33, Charing Cross Road, W.C.

It will continue to be issued as a Monthly Review, devoted to

the development of the Industrial Motor Vehicle, and affording a means of inter-communication between users and makers of commercial vehicles of every description. Under the new proprietary, those features which have proved acceptable in the past will be continued and extended, while innovations to increase its influence with all interested in the motor movement will be introduced.

"The Industrial Motor Review" is published at 6d.; post free 8½d., on the 15th of the month. Annual subscription, 8s. post free.

COMMENTS.

ON Tuesday the Manx Tynwald Court resolved to continue in force for another year the Act which enables the Highway Board of the Isle of Man to give facilities to the Royal A.C. for motor races on the roads in that island. Although permission has been officially asked for, there is reasonable doubt as to whether it will be really required, the Society of Motor Manufacturers and Traders having just informed the Club that it will be better to concentrate the efforts of the motor trade on one great event for 1908. Should this view prevail—and it will certainly have due con-

sideration—the chosen trial will be the International Motor Contest, particulars of which have already appeared in our columns. The joint committee has been formed and preparations are now going well ahead in connection with that event.

Farmers and Motors.

At the various meetings of the Farmers' Union in Lincoln this week many references have been made by agriculturists to the presence of motorists on the roads where grazing by cattle is still indulged in. At Lincoln the recent speech of Mr. Embleton Fox, the chairman of the Lindsey County Council, was taken as the text, and it was said that but for road grazing many of the farmers in the district would scarcely be able to keep any cattle at all. At the same time it was agreed that the complaint of Mr. Fox as to the tenters being away some time from the stock was a reasonable complaint. Ultimately it was resolved that when considering the question of motor traffic attention should be paid to the safeguarding of the interests of farmers in grazing cattle on the road. At other branches of the Lincolnshire Farmers' Union where the matter has been discussed general agreement has been found with the suggestion that an effort should be made to create a national charge for the maintenance of main roads.

Kent's Effort.

EVERYTHING points to almost complete unanimity on this point, and not only are motorists agreeing with farmers as to the equity of such a proposition, but county councils are recognising the unfair way in which the present system works. Now the Kent Council is taking the initiative in securing a deputation of the county councils in the south to the Local Government Board, to urge the matter upon the notice of the central authorities. If some of the motoring organisations

would also associate themselves with this movement, it might hurry Public Opinion a little faster in our direction.

Damage of Holborn.

MR. A. W. GAMAGE, whose portrait we give on page 887 on his 40-h.p. six-cylinder Napier car, will have the sympathy of many motoring friends in the fire of Tuesday, which would have seriously perturbed many men. The great business in Holborn is a tribute to his commercial acumen, while the establishment is one of those places to which motorists from the country, as well as residents in London, freely resort. Mr. Gamage has long encouraged the sporting and social side of automobilism, and his associations with both the North London and the Southern Motor Clubs have ever been of the pleasantest and closest. The Gamage cup annually competed for by representatives of these organisations proves his interest in motoring as a pastime.

The Motor Cycle.

ALL will regret to hear of the lamented death of Sir Henry Colville, who was one of the keenest motor-cyclists in the country. He was infatuated with the machine, and had even persuaded Lady Colville to ride one. Indeed, we believe that one of the very first motor-bicycles ever turned out from Coventry for a woman was built for her. It was a common thing for General Colville to hold motor-cycle races and competitions at his Bagshot house. He had a track of winding and difficult paths serpentine through some twenty acres, and it was his delight to have competitions rather than races over this course. Several well-known men have shared the late General Colville's enthusiasm for the motor-cycle, notably Sir Martin Conway and Sir Conan Doyle; but probably he was *facile princeps* of the trio.

The Removal of High Hedges.

WE regret to have to record such a painful illustration of the disadvantages of high hedges as is suggested in the fatal accident to Sir Henry Colville. It was a pure mishap, one that could not have been prevented, and in which no blame could be attached to any person, but the recommendation of the jury as to the cutting down of the hedge, and the evidence of Sir Henry Rawlinson with regard to the turn in the road being invisible owing to a high hedge at Heatherside Corner, suggests that the county authorities might well survey the roads in their area with a view to clearing other corners similarly hidden from the sight of travellers. Owners of property would be readily

willing to thus increase the public safety, and a systematic inspection of the county roads should be made. In fact, the idea might be extended, and the scouts of the Automobile Association might, in their moments of leisure, report to headquarters all the hedges they find obstructing the view. And then a little consultation between the organisation and the local authorities should be the preliminary to the removal of high hedges at corners by their owners.

Organisation Troubles.

WHILE settlements and decisions seem to have been arrived at in connection with motor-car organisations, the organisation of motor-cyclists is in a parlous state, and few of those concerned are quite sure as to what will happen next. The excellent conclusion of the M.U. and A.A. controversy suggested by the two chairmen has now been endorsed by their respective bodies, and the R.A.C. and the M.U. have wisely agreed to let "the dead past bury its dead" and not indulge in the pastime of "mutual recriminations." Both organisations have previously been partners in good causes, and the dissolution will be made

The photograph reproduced above shows the fifty cars which were sent to Wood Norton for the marriage of Princess Louise of France and Prince Charles of Bourbon-Sicily. They were furnished by the Motor Supply Company, Ltd., of Piccadilly, London, and Messrs. McNaught and Co., of Worcester.

Photo by)

(C. Vandyk.

"decently and in order." The Motor Union has decided not to let the grass grow on its doorstep, and already an Emergency Committee is at work planning the policy to be recommended in the future. In order to lessen the period of uncertainty, it is probable that some arrangement will be made to terminate the agreement before December 31st, 1908—the date on which it would expire in accordance with the terms of notice.

End of the A.A. and M.U. Controversy.

MEANWHILE the General Committee of the Motor Union, at a meeting at which thirty-five of the affiliated clubs were represented, have decided to ratify the "give and take" agreement with the Automobile Association, which, by the way, has now got beyond a membership of five thousand individual members. The patrolling of roads, by this arrangement, is now left entirely in the hands of the A.A., who have generously undertaken to place the road information they have collected, and will daily collect, at the disposal of the M.U. They will also obtain any special information which the Union may desire, and which can only be collected by agents on the

road. On the other hand, the A.A. recognise that parliamentary work, general legal work, insurance, road-warning and direction posts, are within the province of the M.U. In view of this full and free recognition, the Union will in future consult with this body with regard to any new departure it may propose to make in these departments of activity, and thus the avoidance of friction may be guaranteed.

Earl Russell and the Club.

At the moment of going to press we have received copies of correspondence that has passed between Earl Russell and Mr. J. W. Orde, secretary of the Royal A.C., relative to the announcement that it is intended to formulate a scheme to secure to provincial clubs the advantages extended to them by the Royal A.C. Earl Russell pointed out to the secretary that no such decision was arrived at, and asked that the statement should be officially repudiated. In reply he was informed that "no resolution was proposed, but the committee was undoubtedly agreed upon the subject." Earl Russell's next communication intimated that "the temper of the committee was very strongly in favour of terminating the agreement, but very doubtful as to the wisdom of attempting to smash the Motor Union," a reply which brought a note saying that the letter would be laid before the committee at their meeting on Wednesday next. At that meeting Earl Russell will move a resolution of regret that the announcement should have been made.

An M.P. on Motor Buyers.

IN our issue of the 2nd inst. we gave interesting statistics with regard to the possible number of prospective owners of motor-cars in this country, and some conclusions based thereon indicating the extent of the market that is likely to develop for the next season or two. In connection with these a correspondent in a later issue drew attention to the need of remembering that a good many possible motorists dwell in flats as distinguished from ordinary domestic houses. Mr. L. C. Chiozza Money, M.P., referring to this correspondence in his weekly article for the "Morning Leader" on the Work of the World, confirms the figures we gave at the beginning of the month, and assures us that this aspect of the motor was not overlooked in the first instance.

The Dust Trials.

ALTHOUGH the Dust Committee of the Royal Automobile Club has not yet completed its report on the experimental cars and devices entered in Class III., it is in a position to state that two of the entrants showed considerable merit for their devices. The committee recommend that an award be made to Messrs. Dennis Brothers, Guildford, Surrey, for car No. 42 entered by them, which showed considerable reduction in the dust cloud raised by the wheels, and to Messrs. Wayman and Matthews for the device attached to the Vivinus car entered by them, No. 46, which device consists of a complete under-shield, made and arranged to create a draught of air to neutralise the ascending air currents at the back of the car, and thereby reduce the height and volume of the dust raised by the wheels.

Col. Crompton on Roads.

IN his presidential address to the Incorporated Institution of Automobile Engineers, Colonel R. E. Crompton devoted attention to the future of automobilism, especially as regards its development in new countries where the making of roads has received less attention than in the older lands. Recognising that the main arteries of transport in both cases will be either the waterways or the railways, he emphasised the fact that the network of distribution will probably be the roadways branching from or feeding these main arteries. Hence the importance which attached to the formation of roads in new

countries and colonies, and also the necessity he spoke of as to the automobile designers producing vehicles capable of traversing lightly constructed roads. In this connection he naturally referred to the achievements of Col. Renard, the inventor of the road train, and he also gave it as his opinion that the electrical driving of trailers offers a very promising field for mechanical workers in the future.

Main Roads for Motorists.

the main western roads without traversing the tortuous and narrow streets outside the metropolis. The proposed road will lead from Latimer Road, Shepherd's Bush, to a point about two miles east of Datchet. It will run due west to East Acton, over the Great Western Railway and alongside the line to Perivale, and then *via* Greenford, Hayes Bridge, and Dawley to the Bath road, close to Ditton Park. The proposed thoroughfare will be from sixty to eighty feet in width, with a dustless surface, and no speed limit will be enforced. Trees will be planted at each

APPLICATION will be made to Parliament next session for powers to construct a great trunk road from London westwards, for the exclusive use of mechanically propelled vehicles. The object is to provide a means of reaching

and have done much to consolidate opinion and make progress as conspicuous as it is. The Welsh A.C. is "going strong," and out of the sixty-three affiliated clubs now in association with the central body occupies the eleventh place, so far as the number of members is concerned. It is well presided over by Mr. Basil Valentin, of Llanelly, Mr. J. Shimell Andrew being the hon. secretary, with Mr. Glen Taylor, of Briton Ferry, and Mr. H. S. Thomas, of Llanelly, acting in a similar capacity for the eastern and western divisions respectively.

An Inquiring President.

As we were able to announce in our report of the Show last week, one of the most interested, and, to motorists, one of the most interesting visitors was Mr. John Burns, M.P., the President of the Local Government Board, upon whom will fall the introduction of the next Motor Car Bill—unless, of course, it is annually delayed beyond the life of the present Parliament. Mr. Burns not only inspected the cars on the main floor but, like the King of Spain, ascended to the Gallery and showed his desire to gain knowledge wherever such was available. He made an investigation of the tyre displays, and was most critical with regard to the metal-studded bands and other devices

The above illustration is reproduced from a photograph taken in the Court-yard of the Stables at Ingestre, the Earl of Shrewsbury's Staffordshire seat, and shows a fleet of eight Talbots. The first limousine on the right is the one which the Earl placed at His Majesty King Edward's disposal during his visit to Ingestre during the past week. The car on the extreme left is a 15-h.p. Talbot which was at the disposal of the King's messenger.

side. Care has been taken that in planning the road as little house property as possible shall be affected. In addition to the Bath road, the scheme would give motorists easy access to the main Oxford and Salisbury roads, as well as to Staines, Guildford, Walton, and Weybridge. Another similar proposal is also to be submitted to Parliament next year. By this scheme two roads, one commencing at Beadon Road, Hammersmith, the other at Glenthorne Road, Hammersmith, would join at Burfield Street. From that point the road would run close to the Chiswick Park Station, Metropolitan Railway, and through Turnham Green to the popular Bath road, which it would join near Datchet.

The Welsh Club.

CONGRATULATIONS may be accorded the Welsh A.C. on the successful season they have had, and also on the pleasant reunion reported on another page. At this dinner honour was shown Captain D. Hughes-Morgan, J.P., Mr. F. Cory Yeo, J.P., Mr. H. Morton Evans, and Mr. S. L. Gregor, who have rendered good service to the Club from the beginning. Such evidences of appreciation are frequent in the motor movement,

about which the Local Government Board has received many complaints from the authorities in rural districts.

Courtesy on the Road.

THE Midland A.C. has just issued a neat card for exhibition in the motor houses of its members, giving some rules of courtesy and consideration which chauffeurs and others are urged to adopt when on the road. This is arranged in acrostic fashion, bringing the Midland Automobile Club prominently to the front. One useful point of advice is that on no consideration should the motorist drive away in case of accident without first ascertaining the extent of damage done or received. Witnesses should also be obtained to note the track of the wheels of any cars or vehicles concerned, and "a tape measure on your car may often strengthen your case."

FROM the Darracq Company comes an interesting booklet descriptive of a trip across Europe in a Darracq voiturette. The little work is fully illustrated, and describes the extremely arduous journey made by an 8-h.p. two-seated car.

FROM GLASGOW TO LONDON BY DAYLIGHT.

IT can be done comfortably and conveniently by motor-car. There is no need to worry about police guidance or obstruction provided the high road be taken, and, what is even more important, an early start be made. The story I am about to tell has been delayed by the modesty of the narrator, who has been grieved to learn of the disappointment of the police at being passed napping or otherwise robbed of their prey. For we journeyed through danger zones in the district around Carlisle, again at Bawtry, seven miles from Doncaster, and at Buckden, where yellow plaques denoted the vigilance of the Automobile Association.

It was a glorious morning—4 a.m.—when Mr. A. Clifford Earp and the penman set forth on a 35-h.p. Iris from Glasgow. The car was famous, had won a gold medal in the Scottish Trials, and had generally distinguished itself by its silent and consistent running. There was no traffic met all the way to Hamilton, where a few colliers seemed surprised at other people being up so early. Then we encountered a circus removing—weary horses, weary women leading the same, and weary men sitting in the doorway of the caravan, presenting quite an unique spectacle. Kingsley told how “men must work and women must weep.” We saw women nearly doing both.

And then it was a long strong drive over the Ayrshire hills to the Annandale country. There was a slanting sleet that

The Scottish A.C.'s New Road Sign.

shot into our faces as though we were invading a hostile country. Unfamiliar telegraph poles indicated that snowstorms were troublesome at times, while the keenness of the morning air satisfied us as to the bleakness that was possible on those hill tops. The mountain sheep looked askance as the Iris sped forward to Ecclefechan, the birthplace of Thomas Carlyle, and full of associations with the philosopher and his family. The village has cross roads, and, as is frequently the case in Scotland, the police are generally watchful of motorists at that point. The Scottish Automobile Club looks after its members, and is erecting warning signs at many points.

A broad and fertile plain stretches along to the Solway that silvers the landscape with a streak quickly widening as the Cumberland range of hills become more marked in the distance. We saw the “braes of Kirtle,” of which Wordsworth wrote, and then through the Vale of Logan to Gretna Green. Ours was no runaway match—so there was no need to call the blacksmith, who probably finds the supply of spirit to thiraty motors less profitable than the marriage fees that came his way prior to 1856. The next few miles were through the once debateable ground claimed by both England and Scotland, but now acclaimed by both parties as Britain. We crossed Solway Bridge, where photographs had, of course, to be taken, and made speedy travel to Carlisle—interesting historically and important locomotively.

From Carlisle to Penrith was the next stage, tantalising enough to know that a few miles to the right we might have been in the centre of the Lake District; but the air was chill, and breakfast awaited us at the George Hotel, Penrith, a com-

fortable hostelry that has seen many changes in the way of travel. And having thus replenished our own supplies, Mr. Earp got to the wheel again, and we prepared to go over Shap—once a terrible experience for a motor-car but quite a commonplace matter for such a car as the modern Iris. From Penrith to Shap the distance is about eighteen miles—and cold ones, too. Fortunately the surface was fairly good as we wound about the hill and strode through the neat town of Kendal. Towards the river Lune the way was then made, and in Kirkby Lonsdale, one of the trimmest of all Westmorland villages, the old market cross reminded us of a similar scene at Cheddar. To avoid the cobble stones of Lancashire we struck through some of the smoky towns of Yorkshire. Beyond Settle was Skipton, the great wide street of which was full of farming men and farming implements, while the ancient castle nestled away behind the houses out of sight. What charming scenes we narrowly missed, and, but for the invincible determination to land in town that night, might have seen. Wharfedale seemed to call us to Ilkley and Rumbles Moor, (while we could fancy we heard the splashing of the stream at the Strid, near Bolton Abbey. But our way was Keighley, Bingley, Shipley, Bradford's tram-lines, Wakefield's cathedral—not like the traditional cathedral cities such as Hereford, Salisbury, or even Rochester—and on to Doncaster. At the racing town we were called to attention by the railway level crossing; and then we remembered that Penrith had been our last stop, and that was some hours behind. So we lunched.

Beyond Doncaster, and after passing the famous race-course, a narrow streak slanted in the distance. It widened as we drew nearer, and suddenly we were upon the Great North Road. Seven miles ahead was Bawtry, from whence police traps are operated; our pace was needlessly slow. But, although we were in a bit of a hurry—for luncheon and the level crossing into Doncaster had delayed us beyond the schedule—there was no need for undue expense, in which category police fines may be included. Then across Barnby Moor, where Ye Olde Belle welcomes motorists, and seems to have enjoyed a recrudescence of prosperity and popularity—almost synonymous terms where the motor-car is concerned. Newark was the next place of note, and the Iris silently swung across the town on to the pleasant country beyond. What a contrast between the bleak matutinal outlook of the Ayrshire mountains and the rich cultivated area through which the North Road runs to Grantham and beyond. Grantham is an enjoyable-looking place, with a fine row of trees on the main road, and a statue to Newton that would do credit to a busier town. Then we journeyed through Colsterworth, ancient Stamford town and by the dangerous zone of Norman Cross. Alconbury looked like an outpost of the Automobile Association with its badges and signs all bright in the sunlight, revealing a solicitude for the motorist likely to fall among—no, I mean the police. This continued all the way from Alconbury onward to Hatfield. On one of the straight stretches (and how the car bounded along those speed-inducing tracks) we descried a dark figure idling on the side walk; he seemed to be practising the movements of a windmill, and must have been travelling at a very fair pace, for when we drew up to talk with him he was out of sight. Whichever of the parties was moving the faster is still uncertain, as that oft-repeated effect of moving trains passing each other was produced. It was a pity, for he might have been a policeman anxious to direct us to a shorter path than the one we were pursuing.

Then through Eaton Socon and Biggleswade, where an agricultural motor reminded us of Dan Albone, we reached Baldock.

The rest of the journey—38 miles to London—is familiar to all who have motored near the Capital. The road is by the ancestral gates of the Salisburys and into Barnet, Finchley, and the northern suburbs of the Metropolis. Into these the Iris glided gracefully, nothing loth—nor were the riders—to reach home after a run of more than 400 miles between the break o' day and the twilight. Mr. Earp had driven right through, and but for the two halts mentioned there was ne'er a stop—a tribute to car and driver alike. The Iris certainly is a vehicle for touring in comfort, as the long day's journey amply demonstrated.

W. H. B.

The Paris Motor Car Show.

(Concluded from page 828.)

AN enquiry among the makers who are exhibiting six-cylinder cars at the Paris Show does not tend to prove that the French purchaser is "gone" on the six-cylinder motor for ordinary touring work. There are about forty makers exhibiting some fifty "six" models in the *Salon*, and it is a rather curious fact that only about a third of the vehicles on

Fig. 10.—Front View of Burlat Engine.

view are over 40-h.p. Possibly the fashion for moderate sized cars, with, of course, a correspondingly reduced fuel bill, has something to do with the modest pretensions of the "sixes" at the Paris show. The six-cylinder car will certainly find a place in the output of French works next year, and an important one at that, but its usefulness is not so clearly defined as is that of the two and four cylinder machines. Nevertheless there are one or two firms doing a deal of work to popularise the six-cylinder, as, for example, the Delaunay-Belleville, whose 15-h.p. machine is an interesting production. The Lorraine-Dietrich six, with cylinders of 80 by 120 and rated at 15-20-h.p., is, perhaps, one of the smallest of the better-known cars in the show. The Mors six, with the cylinders all cast separately, anticipates another objection, since it hides nearly two of its cylinders beneath an overhanging dashboard. Several of the six-cylinder engines have a double exhaust pipe, one for each three cylinders, and in some cases one can be used alternatively, to permit the other to cool. It may be allowed that the six-cylinder models are of merit, and are excellently designed in the great majority of cases, but they appear to run very much on the same lines as their four-cylinder brothers, each following the practice of its maker. The six-cylinder Berliet is somewhat of a relief to the majority of makes, since it presents the powerful air-compressor used as an aid to the cylinder pressure in times of need. It is somewhat difficult to account for the fact that most of the six-cylinder exhibits consist of engines not fitted into chassis, unless it is that the makers are not pushing the "sixes" next year any more than they did last season. High tension ignition predominates with these machines, and there are, perhaps, only half-a-dozen "sixes" with low tension ignition, following in most cases the standard practice of the makers. Finally, the matter of casting the cylinders in one, two, three, or separately, is not yet resolved, for there are numbers of all kinds to be found, although, perhaps, the casting in pairs is the most predominant. The Beatrix is about the only "mono-block" six-cylinder to be seen, while the 120-h.p. of the Itala make, with cylinders 140 by 140 mm., is one of the most powerful models.

The appended table, compiled by "L'Auto," shows the details of some of the six-cylinder motors at the Salon:—

Names.	Bore and stroke mm.	Ca'a-logue h.p.	Names.	Bore and stroke mm.	Cata-logue h.p.
Berliet	100 x 140	40	San Giorgio	—	40

Bollee	130 x 150	75	Weyher & Richmond	—	25-30

The only two British firms exhibiting cars are the Wolseley Tool and Motor Car Company and the Rover Company; the former is represented by a 14-h.p. Siddeley car, with side

Figs. 11 to 14.—Diagrams illustrating the Action of the Burlat Motor.

The first view shows the initial position, cylinder No. 1 commencing the explosion stroke. The second illustration shows the position when the cylinders have made one-eighth of a revolution and the crankshaft a quarter of a revolution. In the third drawing the first cylinder has travelled half its course, while the complete engine has made one-fourth of a revolution. The fourth sketch shows a sectional view of the engine through the crankshaft.

entrance body, an 18-h.p. chassis, a 40-h.p. chassis, and a 45-h.p. six-cylinder vehicle with limousine body. The Rover Company's exhibit consists of one of their 8-h.p. and two 6-h.p. single-cylinder vehicles, the details of which have been dealt with in the Olympia Show reports in these columns.

Besides the eight-cylinder car of Burlat (Fig. 10), whose rotating motor is attracting so much attention at this Show, and which was described last week, there is another eight-cylinder motor at the Show, made in Austria by Messrs. Laurin and Klement. Its cylinders, Fig. 15, 88 by 110 mm., in two blocks, make a light group weighing about 600 lbs. complete. The ignition is obtained by means of two high tension magnetos, although, owing to the impossibility of finding a magneto suitable for an eight-cylinder motor, two high-tension machines are used; this deficiency is, however, being remedied by the Simms-Bosch firm. There is also accumulator ignition, this being connected to the same sparking plugs as the magnetos. The motor does not present other interesting features, although its length is no more than that of a good many "sixes." Whether this is the doyen of the eight-cylinder motors for touring cars remains to be seen.

The Stabilia car frame is hung below the wheels of the chassis, and is simply the reverse of the usual frame, which is suspended above the axles of the wheels. It is claimed that the car cannot possibly overturn when hung in this manner. This is about the only exponent of the extra low chassis which is to be found in the Show.

"See the cars first, and then, if we are not tired, we will go round the accessories," is a remark often made by visitors to Paris. They would, however, do better to devote a day to see the accessories only, which are in the first floor rooms of the Grand Palais, where the artists are wont to exhibit their canvas. The whole of the space occupied by the world-famous Salon des Artistes Francais is now occupied by tyres and accessories for cars and bicycles. And the accessories overflow into the galleries on the ground floor, and even there are not exhausted, for the Annexe to the Show, on the Esplanade des Invalides, has a liberal sprinkling. All this tends to prove that the accessory is not a neglected article to be chosen at hazard after the car has been purchased. The choice of accessories is almost as important as the choice of the car, for almost any vehicle on the market nowadays will run, but lack of or poor choice of accessories means the difference between comfortable riding and discontent by the chauffeur, owner and even the ladies of the party. And this is easily proved by reference to the splendid exhibits which are displayed before eager crowds in the Paris Show.

Fig. 15.—The Laurin-Klement Eight-Cylinder Engine.

In the galleries divided from the main nave by soft hangings (and yet not hung in such a way as to encourage fire, as was the drapery in front of the lights in the dome of the grand nave, and which consequently gave an unwonted attraction last Saturday to the spectators by taking fire, following upon a short circuit) are heard shrill tootings, piercing sirens, gruff horns of the basest tone, and the crackling of magnetos. The military music in the main hall is unheard, and accessories have a clear run without a thought being bestowed upon the most troublesome of questions—the choice of a car. Here are just a few of the novelties in the way of accessories. A silencer, which is

claimed to be more efficient than even a free exhaust is the Silencer a vide (Fig. 16). It consists of a hollow cylinder into which the exhaust pipe discharges its gases. In two different places these escape around the orifice of a funnel so as to induce a free current of air down the funnel, the larger end of which is open to the atmosphere. The air passing down the funnel increases in pressure as the latter decreases in size and mixes with the exhaust gas escaping round its orifice and exhausting the gas in the same direction as the induced air, and at the same pressure,

Fig. 16.—The Vacuum Silencer.

thus really theoretically abolishing the back pressure and increasing the motor efficiency as well as giving an efficient silencer.

A feature of the accessory department is the large number of shock absorbers on view. Pneumatic, liquid, spring, worm gear, in fact, all manner of applied mechanics is pressed into the service. One of the simplest, at least, is the Sans. In this, at the articulated joint of two levers meeting in the enclosed part of an elliptic spring, is a rounded extension of each lever. Around this is a friction band, which can be regulated at will according to the tension required, and which acts as a brake on the spring action. Shock absorbers are closely identified with systems of suspension, so that it is not surprising that there are also several of the latter on the market to compete. Generally these consist of blocks of rubber placed around the extremities of the car springs, and with or without pneumatic cushions. In one or two cases these soft rubber cones are quite of large dimensions.

Miniature mirrors to observe the traffic at the rear are well known, as are also the electric indicators to give instructions to drivers. Several excellent specimens of the latter are on show. It is a remarkable fact that as soon as a new accessory appears there is a market for it, and it would be hard to point out a single article which has lost favour, except through changing conditions of the trade. Certainly the public welcome all these little aids to comfort, even though the total cost adds considerably to the prime outlay for the car.

The Archimede is a rotary appliance which, with one end inserted under one point of the tyre, whips the cover from the rim in less than a minute, and with only the trouble of turning a handle. It preserves the tyre from injury and considerably eases the operation of tyre removal. The Consometre is an apparatus which indicates the consumption of fuel of the car at any given moment; it also registers the total consumption on the run and the quantity remaining in the reservoir. In order to decrease the work and trouble required to sound the horn there are several appliances on view. The Electric Sonor is one of these. It consists of a bell re-sounded through a horn and operated by a 4-volt battery, with a push button on the steering wheel.

Amongst the tyre pumping machines there is the Michelin pump, weighing 8 lbs. and pumping up a large tyre to full

pressure in three minutes. The Vadam pump (Fig. 17), which is being introduced into England by the London Motor Garage Company, Ltd., does better; it inflates the tyre in a minute, and without overheating. It consists of a number of very small and quick action pumps united in one cylinder, and the whole is operated by a friction wheel making contact at will with the flywheel of the motor. The Simplex pump is of another type, chain driven, and entirely of metal. It pumps the air *en bloc* and at great speed.

Headlights are galore, electric and others. There are some which are arranged for turning at the same time as the steering wheels of the car; another inventor has hit on the idea of making directing supports to serve the same end with any lamp attached. Among the electric headlights there is one known as the Triparabolique, of which the principle, in addition to the parabolic mirror lining the casing, consists in the three lights arranged one in front of the other, and of the total illuminating power of three candles only. Thus the most possible is made out of the parabolic mirror. It is claimed that this headlight will illuminate the road 450 yards ahead, and that a newspaper can be read at a distance of 160 yards. Its weight is under 4 lbs. complete. The dynamo-phare Eyquem solves the question

several new forms are to be seen. The trouble up to now has been in the smaller bearings, to replace a broken ball without dismounting the whole of the bearing. Broken balls are the bugbears of small bearings, and not much has been done to remedy the defect. One or two appliances are shown in which the balls are mounted on a single crown and attached by headed rivets, two by two. In the larger size bearings there is more scope to make a good job, and among these the Roche and Sauton are worthy of notice. The novelty consists in the fact that the steel ball is located in a brass crown and kept in place by a pressed rim on the side where the ball is inserted.

Carburettors are also receiving a deal of attention this year, many makers of cars now fitting carburettors to their vehicles which are being made by outside specialists. This part of the automobile is one which should, and does, obtain the closest attention of inventors, and probably more patents are filed on this detail than on any other point of the car mechanism. There are so many makes and so many claims made by the constructors that to enumerate them would fill columns; and again, each type has a special point which presents interest only to a few. There are one or two carburettors on view which will work equally well with all kinds of fuel; this is a claim out of the common, and one which is bound to obtain recognition when the time comes to seriously consider the use of either alcohol or heavy oil on motor-cars.

A neat appliance is the Auto-Routier, which operates from cogs on the front wheel of the car. It presents to the chauffeur the route he is taking in plan view inside a glass case and a needle points to the exact spot where he is at any moment whilst the chart gradually rolls up out of sight. On the plan is an indication of all the towns, hills, turnings, dangerous spots, &c., and as the rolls of plans can be replaced in the apparatus very easily, the accessory may be of great service to those not knowing the roads over which they are travelling.

Should the non-skidding tyre be termed an essential or an accessory? Even the tyre makers are not sure of the point, otherwise the non-skids would rarely take the form of a band to put on over the cover. However, the question of lost rivets appears to be settled in the minds of the makers, as a glance at the very much used non-skidding tyres will show. Steel studs are increasing in formidable proportions, which may be rather exaggerated when one considers the decreasing favour in which heavy cars are regarded. Some of these rivets protrude nearly half an inch from the tyre; the rivets may be round, or square arranged right across the tyre thread, or simply on the sides; and they nearly all have washers

beneath to prevent the rivet from cutting the fabric. The use of leather covers is much on the increase, some very neat tyre covers being made with chrome leather. One non-skid on view consists of rivets driven through fibre pieces laid crossways over the tread, three rivets per fibre. The latter is, of course, impervious to moisture, and is very hard indeed to break or wear. In another the steel studs are surrounded, every other one, by leather. This section cannot be left without a reference to the Norat pneumatic tyre protector. The sides of the tyre are entirely encased in a plate of steel, and in this, at the top, and, of course, around the track fits a leather-steel band, which bears on the exterior casing of an ordinary pneumatic tyre. Thus resiliency is retained and damage to tyres is obviated. The band around the tread fits into the space left by the two steel plates on the sides of the pneumatic, and these also have studs to prevent creeping of this band. The contrivance is certainly neat but somewhat heavy.

At the recent motor show at Madison Square Garden, New York, 63 per cent. of the cars on view had cardan shaft transmission, 31 per cent. side chains, and in 6 per cent. the final drive was by a single chain.

of electric lighting of vehicles, and at the same time provides an excellent source of light for the road. It only takes a fifth of a horse-power from the motor, from which it is belt driven. It charges a small battery which is automatically switched on when the car is at rest.

The Autoloc is one of the accessories which appears to be the most useful, but seldom seen on cars. It fulfils a variety of purposes, and, as its name implies, automatically locks any and every action which is commanded by hand or otherwise. It presents no inconvenience in respect to unlocking when a modified action has to be made, and in fact the operator is quite unaware of its action. It does away with the ratchet on the brake lever, it enables a lever to be used in any position without the fear of displacement, unless by voluntary means, and for this reason is applicable to practically all the manoeuvres of the car driver. The appliance, which only weighs a few ounces, consists of a double eccentric, acting on distance balls, kept apart by a spring, so that the latter automatically holds the eccentric in place when the movement progresses, by means of its pressure on the steel balls or rollers, which can only move with the movement of the eccentric, which is hand operated, according to the movement of its corresponding lever.

Ball bearings have received renewed attention this year and

CONTINENTAL NOTES.

Motoring in Bavaria.

Bavarian manufacturers of motor-cars are complaining of the vexatious police and other regulations which are impeding the free development of the new industry. In Bavaria the average speed of motor-cars must not exceed nine miles an hour in towns or villages. Of the 27,026 motor-cars in the German Empire on January 1st only 2,356 were registered in Bavaria.

Public Motor Services in France.

The Renard Train Company are establishing a service between La Poudy and La Charité. The Orion Company are also making some experimental runs in connection with a projected service between Bourg-Argental and Annonay.

Milk Delivery by Motor-car.

A large creamery at some distance from the large industrial cities of Essen and Bochum, Germany, is arranging for the delivery of its milk to these centres by several specially-built motor vehicles. The milk is first to be brought to a low temperature by means of cooling machines, and is to be transported in large felt-insulated cans. The daily round trips of each van

system, and eventually the matter was placed in the hands of the A.C.F. technical committee for solution. The question of an international formula for use in touring car competitions was next discussed, and it was agreed that such a formula should be prepared.

Belgian Motor-car Imports and Exports.

To the end of October last the imports of foreign motor-cars and parts into Belgium had this year attained a value of £142,764, as contrasted with only £135,324 in the first ten months of 1906. During the same period the exports of motor-cars and parts from Belgium increased from £317,200 to £368,856.

Public Services in Germany.

A concession has been granted for the establishment of an electric motor-omnibus service between Baden and Alland. While the vehicles will run on the ordinary road, the motive-power will be furnished to them by means of overhead trolley wires, in the same way as on electric tramways.

Stone Throwing at Motorists.

For some time past a good many complaints have been made as to the dangerous practice of schoolboys throwing stones

The Paris Salon.—A View of the Industrial Vehicle Section in the Annex.

will be completed in three to four hours, so that the milk will reach the customers quite fresh. About 2,000 gallons per day are to be transported in this manner.

Motoring Events in 1908.

The annual "Congres du Calendrier" was held in Paris last week, when the dates for the principal motoring events to be organised in 1908 by the various national Automobile clubs were provisionally agreed upon. The Nice meeting will run from March 22nd to 31st, the Targa Florio contest was fixed for May 10th, the Prince Henry of Prussia touring competition for June 9th to 17th, the A.C.F. Grand Prix for the first fortnight of July, the Ostend week for July 13th to 17th, the Ardennes Circuit and the Liedekerke Cup for July 20th to 30th, and the Coupe de la Presse for the first week in August.

An International Automobile Congress.
